The interior of the knob-shank is provided with a female screw to receive the projecting screw-cut portion of the hub, which hub may have a bearing in one or both sides of the case.

Claim.—The hub B, extending through the plate C, and provided with a screw upon its extended part *b*, in combination with the knob A, with female screw to fit upon the said extended part, substantially as set forth.

143,175.—Car-Spring.—AUSTIN W. MORRIS, Philadelphia, Pa. Application filed March 11, 1873.

Claim.—The combination of a series of elliptical springs spirally arranged with a box or case, so that the ends of the first spring rest on seats equidistant from the contiguous head-plate, the ends of the second spring on seats a short distance therefrom, and at opposite sides of the first seats, the seats being farther removed from the plate than the former, and so on in succession throughout the whole series of the springs, each spring overlapping the preceding one at or near the center of the case, substantially in the manner and for the purpose set forth.

143,176.—Machine for Clearing Streets of Snow.—WILLIAM E. MUNROVE, Fair Play, Colorado, Ter. Application filed February 17, 1873.

A case in which is placed a furnace supplied with an air-blast by a blower, the case ending at the front near the ground, in a long and narrow opening, through which the heated air and smoke are projected against the snow and ice covering the ground.

Claim.—1. The machine for the removal of snow, ice, &c., having the adjustable wide-mouthed case H, furnace K, and blower L, constructed to operate in the manner and for the purposes herein set forth.

2. The combination of the case H supported on guideways *i*, the lever E, and connecting mechanism *a g g' g''*, for the adjustment of the mouth A in relation to the surface of the ground.

3. The combination of the case H, blower L D', pulley and clutch M N, and lever O, as and for the purpose set forth.

4. The combination of the furnace K, case H, blower L L', pulley M, clutch N, and pulley *s* attached to the wheel, all substantially as and for the purpose set forth.

143,177.—Washing-Machine.—DAVID B. MYERS, Ubrichsville, Ohio, assignor of one-half his right to CHRISTIAN D. HELWIG, same place. Application filed August 18, 1873.

In a suitable wash-box is arranged a series of rollers. Pivoted above these on standards is a swinging frame having a rubbing-board; and on each side are clamps, operated by levers and springs, to hold the article being washed.

1. In combination with a rubber of a washing-machine, such as herein described, a pair or series of levers, *j*, and cross-bar *k*, operating to form catches for retaining articles of clothing or fabrics in position while being washed, substantially as described.

2. The shaft *n*, lever *o*, rod *p*, arm *m*, links *l*, supported and carried by the bent arms or levers *f*, in combination with the levers *j*, cross-bars *k*, springs *r*, and rubber A, constructed as described, for the purpose specified.

143,178.—Potato-Bug Destroyer.—WILLIAM H. MYERS, Oregon, Wis. Application filed March 1, 1873.

Claim.—1. A machine for destroying bugs, provided with revolving rakes F, scoop L to receive the bugs, roller M, and rake P for destroying the bugs, substantially as shown and described.

2. The cranked axle 6, pitman N, and rake P, in combination with the scoop having roller M, all arranged so as to keep the bugs drawn beneath the roller, substantially as shown and described.

3. The roller M, operated by the cranked axle, pitman, and roller, in combination with the scoop, all arranged so as to destroy the aforesaid bugs, substantially as shown and described.

143,179.—Hemp-Machine.—URANIA U. NEILL, Key West, Fla., administratrix of JOHN E. NEILL, deceased. Application filed August 8, 1873.

The material passes from an inclined table between a pair of rollers, and is then guided upwardly and through another pair. Revolving yielding scrapers are arranged, by means of combined journal-boxes, on opposite sides of the roller, and near where the peripheries of the upper and lower set approach each other.

Claim.—1. The combination and relative arrangement of the feed-rollers I and scraper-rollers Q and *q* within the supporting-frame, substantially as and for the purpose specified.

2. The feed-rollers I and yielding scraper-rollers Q and *q*, combined by means of the united journal-boxes F and R, in the manner and for the purpose substantially as shown.

143,180.—Harness-Buckle.—OLIVER B. NORTH, New Haven, Conn, assignor to O. B. NORTH & CO, same place. Application filed February 21, 1873.

A strap is passed through slots in the buckle-frame, embraces the trace, and is fastened by a buckle or equivalent means.

Claim.—In combination with a buckle consisting of the frame A B C, the bars or plate F F, and the studs *a*, a device substantially such as described, to transversely inclose the trace between the studs *a*.

143,181.—Well-Auger.—WILLIAM L. PAYNE, Topeka, Kans., assignor of one-half his right to JOHN G. SEARLE, same place. Application filed August 7, 1873.

When the auger is full it is withdrawn from the well by sliding it on the operating-shaft. The top of the square tube is rounded, and is provided with a loose collar, in which it revolves, the collar having an arm pivoted thereto, to which the elevating-rope is attached. As the auger revolves the arm drags down the side of the well and prevents the collar from revolving and the rope from twisting around the shaft.

Claim.—The auger *l* having the hinged doors *m*, square tube *i*, through which the shaft *c* passes, collar 2, and arm 3, the parts being combined for operation substantially as shown and described.

143,182.—Fire-Escape Ladder.—JAMES S. PIERSON, Brooklyn, N. Y. Application filed February 5, 1873.

The telescopic tube is elevated by pneumatic pressure applied through the hollow trunnion on which it turns. The jointed links surrounding the tube at intervals are connected by chains, so as to form a ladder on each side when extended.

Claim.—1. The chain L connected, with the fixed links *g* to the upper ends of the sections of the telescopic tubing and with loose rings A that embrace said sections, as specified.

2. The hollow trunnion *a* applied to the telescopic tubing as a means of connecting the same with the air-tank, as set forth.

143,183.—Carriage-Top Setter.—JONAS POTTENBURGER, Farmersville, Ohio. Application filed April 5, 1873.

The height of the carriage-top is regulated by adjusting the segment-boards up and down, and the inclination which the top is to have by means of the slotted arc-braces.

Claim.—The jigoted segment-board B, with the arc E and curved slot *e*, with or without a spirit-level and plumb-bobs, substantially as shown and described.

143,184.—Adding-Machine.—SOLOMON POOL, Chapel Hill, N. C. Application filed June 13, 1873.

A revolving plate, confined between a stationary base and face-plate, and carrying a loose series of numbered concentric rings with a peculiar decimal trip, is moved by projecting pins on an exterior flange. The stationary face-plate is provided with suitable reading-openings, with a set of figures near its outer edge, and with two sets of engaging-dogs for each ring—one of them for bringing the rings all to zero at the radial window, and the other set for separately acting on the particular ring under operation.

Claim.—1. The loose rotary rings E E^1 E^2, each having a pin, *e*, combined with holder H, having the three pins A^2 A^3 A^4, to cause the rings to be brought to the 0 or zero, in the manner described.

2. The rotary plate B *b* *b'*, counting-plates E E^1 E^2, held thereto by friction, and having pawl, ratchet, and pins *c*, stationary top notched cap-plate G *g*, having notch K, and holders H^1 H^2 H^3, all combined to enable columns of figures to be counted, in the manner described.

3. The ring C, fixed to a rotary plate B, and having numerals placed at intervals to correspond to the distance between pins *b'*, combined with a stationary cap-plate, G, having the hole J placed in the radial line from notch K to the center-pin *a*, to enable the counter to verify each addition.

4. The arrangement of the odd and even numerals on ring C upon different colors, to enable the eye to detect at a glance any mistake of the hand in bringing forward a figure from either side of the right one.

5. The loose block-pawls F, held by springs *f* in recesses of the rings E, combined with the end inclined arc-flanges D and teeth F, to allow the plate B to revolve in either direction, at the times and in the manner set forth.

143,185.—Wagon.—FERDINAND POST, Clinton, Iowa. Application filed May 28, 1873.

To cause the rear wheels to steady and always follow the front ones, allowing the wagon to turn in small space.

Claim.—The combination of the tongue-piece C, supplemental pieces *c*, chain *k*, axle A, bounds H, and cross-piece F, to operate together as described.

143,186.—Gaiter.—WILLIAM E. PUTNAM, Boston, Mass., assignor to W. E. PUTNAM & COMPANY, same place. Application filed April 5, 1872.

Claim.—In a gaiter or shoe having a front or instep opening and an overlapping flap, a gore-piece, secured at one edge to the flap, and at the other edge to the leather flanking one side of the instep or front opening, as herein shown and described, for the purposes specified.

143,187.—Car-Brake.—EDMOND O. RICHARD, Quebec, Canada, assignor of one-half his right to JEAN E. RICHARD, Columbia, S. C., and JOSEPH C. RICHARD, Quebec, Canada. Application filed July 3, 1873.

The brakes may be applied (at the engine) to the cars, in succession, and the uncoupling of any car will cause the brakes to be put in operation automatically.

Claim.—1. The combination, with a windlass or other winding device on the engine and car-brakes, having suitably-arranged pulleys, of a brake-chain or rope connected by both ends to the engine, and engaging by its return branch with said pulleys, substantially as specified.

2. The combination, with an automatic uncoupling device, of an automatic car-brake, substantially as specified.

3. The hinged coupling frame K, bearing on one side of the draw-head the extension *q'*, and on the opposite side thereof the lifting plate *w*, respectively designed to engage with a similar lifting-plate and extension connected with the opposite car, substantially as specified.

4. The combination, with the hinged coupling-frame K, having the lifting-plate *w* and the extension *q'* on opposite sides of the draw-head, of the hinged guide-plate, key, and adjustable suspension-lever, substantially as specified.

5. The combination, with the coupling-frame K, of the transverse journal-shaft, slides, and pivoted joint, designed to move in line with the spring at the rear of the draw-head, substantially as specified.

6. The arrangement of the winding device, brake-chain, and pulleys, whereby the brakes are operated in succession from the rear, substantially as specified.

143,188.—Machine for Molding and Pressing Bricks by Hydraulic Pressure.—ETHAN ROGERS, Cleveland, Ohio. Application filed March 13, 1873.

The valve which closes communication between the upper plunger-cylinder and the exhaust-chamber and pipe is hollow and perforated, and has in its face a small valve, whose stem is attached by collar and spring to the supply-valve. The arrangement is such that when the two large valves are closed the small valve must open. The construction and combination of all the parts are such that each separate movement of the press is started by the parts last in action.

Claim.—1. The combination of the valves N O P, arranged substantially as and for the purpose set forth.

2. The device for removing the pressure from the top of the upper plunger when a certain pressure is attained, the said devices consisting of the cylinder V, spring-piston *v'* V', rod *v*, lever W, rod *l*, lever 3, arm 4, engine 5 6, rod 7, lever 8, valve-stem *n*, and valve O, substantially as set forth.

3. In combination with the upper plunger D, the water-engine T, by which the said plunger is held down upon the bricks against the upward pressure of the lower plunger C, when both are rising, and the upper plunger is raised from the bricks to allow the removal of the pressed bricks.

4. The combination of the lower plunger C and piston and cylinder *c' c''*, to aid the descent of the plunger against the pressure of the water column in the vertical pipe M.

5. The combination of the valve N, water-engine 6, arm 4, lever 3, and spring-piston V' *v*, closing the valve N between the two rams, to cause them to rise simultaneously, substantially as described.

6. The combination of the hooked arm *c'*, lever *c*, lug or arm *u'''*, rock-shaft U, arm *u*, pitman *u''*, slide-valve T', engine T, rod S, lever R, rod *d*, and upper plunger D, substantially as and for the purpose set forth.

7. The pulling-engine 13 14, acting to reverse the valve 5 of the engine 6 when released from the catch-lever 3, substantially in the manner and by the means described.

8. The combination of the engine F, passage 15, and engine 13 14, allowing the operating of both engines by a single slide-valve, *f*, substantially as set forth.

9. In combination with the plunger C, operating as described, the screw H' to limit the upward movement of the rod H, so as to adjust the depth of the mold to the condition of the clay used and the desired thickness of the bricks.

143,189.—Combined Shutter Fastener and Bower.—RUDOLPH RUHLMAN, Trenton, N. J. Application filed September 1, 1873.

Claim.—The combination with a window-frame and shutters, of hooked rods D D, hung to the said shutters, and adapted to hooks *a a'* on the same, to perforated plates secured to the window-frame, and to holes in the latter, as set forth.

143,190.—Bed-Bottom.—WILLIAM H. SEARS, Cheshire, Conn., assignor to TITUS STOWE, Readsborough, Vt. Application filed August 16, 1873.

A wire-spring for the suspension of each slat, at its ends, to the bedstead-frame, shaped with a straight portion at its middle; then, at the ends of such portion, at right angles, and one coil at the middle of each side; the ends of the wire affixed to the frame, and partially bent round it. An additional straight piece is passed through and fastened to the coils. The slat lies between the two straight pieces.

Claim.—The spring for bed-bottoms herein described, consisting of the two legs secured to the bar A, bent to form the bar *b*, and combined with the bar *c*, the end of the slat passing between and supported by the said bars *b c*, substantially as set forth.

143,191.—Tumbling-Shaft.—DANIEL SNELL, Springfield, Ohio. Application filed March 25, 1873.

A rectangular box provided with central bore and longitudinal grooves, together with a rod secured to a head provided with lugs corresponding to the bore and grooves, passing out through a bearing-box, placed in the end of main box, with lugs or ribs, also corresponding to the grooves, and at the other end of the main box a forked coupling to connect with shaft of power.

Claim.—1. The box A, provided with central bore having grooves *a a*, substantially as and for the purposes herein set forth.

2. The combination of the longitudinally-bored box A, having grooves *a a*, the head B, with ribs *b b* and rod C, the bearing-box D, with ribs *d d*, and the coupling E, all constructed and arranged substantially as herein set forth.

143,192.—Horse Hay-Fork.—IRA E. SNYDER, Woodward, Pa. Application filed February 15, 1873.

Two pivoted tines are parallel with three sliding bars, for insertion into, and turned at right angles for raising the hay, being locked in the hoisting position by a shouldered spring-catch abutting against the under side of a cross-head, and released therefrom by a cam-trip and chord.

Claim.—In a hay-fork having the side bars C, the central sliding bar B, and the folding prongs G, the locking devices, consisting of the spring-stop *m* and the dog *h*, connected to the central bar B and shouldered guard E, substantially as shown and described.

143,193.—Balanced Valve.—JOSEPH H. STOMMS, Winona, Minn. Application filed March 24, 1873.

The packing-ring is pressed upon the hollow valve by the follower and springs within the cylinder, which, in connection with the peculiar form of the valve, balances the latter. The ribs form guides for the valve.

Claim.—The hollow valve B with its ports *j j*, exhaust cavity *m*, seat C, and ribs *f f*, in combination with the packing-ring *o*, follower *b*, spring *d*, and cylinder F, substantially as and for the purpose specified.

143,194.—Bag-Holder.—GEORGE W. STRIKER, Iowa Falls, Iowa. Application filed August 18, 1873.

A bed plate has a hinged prop at its top and back to regulate its inclination; also a pivoted hoop, which holds the bag, these two being supported by a pivoted brace at each side.

Claim.—The combination of the bed *a*, brace 3, hoop 5, and brace 6, substantially as described.

143,195.—Coupling-Joint for Reapers, &c.—GEORGE W. SYLVESTER, Plain View, Minn. Application filed July 23, 1873.

A metal lining, located between the packing and adjustable sections, to prevent the packing from getting between the joints.

Claim.—In combination with the adjustable sections B B', and packing D, the lining E', located between the two, substantially as herein described, for the object specified.

143,196.—Fire-Proof Building.—LUCIEN A. TANTIÈRE, New York, N. Y. Case A. Application filed August 28, 1873.

The hollow bricks or tiles which form the ceiling are supported by angle-shaped bars suspended from the flanges of the iron floor-beams by hangers of bent metal, so as to allow contraction and expansion in the metallic portions without detriment to the less-expansible ceiling.

Claim.—The hangers *b*, *c*, or *c'* catching over the bottom flanges of the floor-beams A, in combination with bars *d*, which support the filling bricks or tiles of a ceiling, substantially in the manner herein shown and described.

143,197.—Fire-Proof Building.—LUCIEN A. TANTIÈRE, New York, N. Y. Case B. Application filed August 28, 1873.

The hollow bricks or tiles of which the ceiling is formed are supported loosely upon beveled brackets attached to the wooden floor-beams above by screws; or, in lieu of these, angle-shaped bars resting within hook-shaped supports. The wood-work is thus protected against fire, while the fire-brick is readily attached and detached, and is independent of expansions and contractions in the supporting-beams.

Claim.—The spikes A, provided with supporting hooks or heads, and intended to be fastened in wooden floor-beams B, or in strips nailed to said beams, in combination with bars or brackets C, which support the filling bricks or tiles of a ceiling, substantially in the manner shown and described.

143,198.—Skirt.—WILLIAM S. TAYLOR, Brooklyn, N. Y. Application filed June 3, 1873.

The waistband of the skirt is funnel-shaped, to fit the form.

Claim.—1. As a new article of manufacture, a skirt provided with the circular band A, constructed and arranged as and for the purpose specified.

143,199.—Holdback for Carriages.—DANIEL TERRY, Wakeman, Ohio. Application filed April 28, 1873.

The yoke is attached to hooks which are fastened to the ends of the thills. The strap which is secured to the yoke is buckled to the girth of the harness.

Claim.—The yoke C and breast-strap D, as arranged, in combination with the thills A, having the hoops B, as and for the purpose specified.

143,200.—Steering-Apparatus.—WILLIAM E. THOMAS, Queenstown, assignor to himself and JOHN T. LOWE, St. Michaels, Md. Application filed August 22, 1873.

Claim.—1. The combination, with a rudder, N, of the sprocket-wheel, chain, and reversely-threaded screws rotated in opposite directions, as and for the purpose set forth.

2. The combination, with the reversely-threaded screws of a steering mechanism, of the wide pinions H H made fast to their ends, rotating as well as sliding on guide-rods A A, and operated by a spur-wheel, G, as and for the purpose specified.

143,201.—Seal-Lock.—JAMES E. THOMSON, Buffalo, N. Y. Application filed April 22, 1873.

The cover of the seal is hinged so as to move both laterally and vertically, and is secured when in its proper position by a spring-catch. Pins upon the cover move through grooves in the bar underneath.

Claim.—1. The double-hinged seal-cover F, in combination with the sliding bar B of a seal-lock, substantially as and for the purpose set forth.

2. The bar B, with its teeth, spring-catch, and grooves, in combination with the cover F, having the openings, pins, and shoulder *f*, as set forth.

143,202.—Manufacture of Sulphuric Acid.—ELIHU THOMSON and WILLIAM H. GREENE, Philadelphia, Pa., assignors of one-third their right to STEPHEN GREENE, same place. Application filed July 28, 1873.

The sulphurous gases from the burner can be tempered by passing through the extended conduit, and are conducted into the first vertical chamber beneath the grating, rise through the porous packing, meeting the streams of dilute nitric acid. The products of the reaction are sulphuric acid, which is syphoned off from the base of the chamber, and hyponitric acid and nitric oxide, which escape into the second vertical chamber, where they are absorbed by water and oxidized by air. For the manufacture of concentrated acid the gases are admitted to the first vertical chamber at two points, one above and the other below the grating. The formation of the walls prevents the acid from attacking the joints.

Claim.—1. An apparatus for the manufacture of sulphuric acid in which the gases evolved from the combustion of sulphur, iron pyrites, or other sulphides are admitted at two points, one above the other, and in two currents of different temperatures, to a chamber filled with a packing of porous material, which is kept constantly moistened with nitric acid, substantially as and for the purpose set forth.

2. An apparatus for the manufacture of sulphuric acid in which the nitrous gases evolved from the reaction of sulphurous acid and nitric acid are subjected to the action of cold water and currents of atmospheric air in the passage of said nitrous gases through a chamber filled with porous packing, substantially as described, whereby the nitrous gases are oxidized and condensed to form nitric acid, which can be again used in the continuance of the operation.

3. In an apparatus for the manufacture of sulphuric acid, the combination of a burner for evolving gases from the combustion of sulphur or sulphides, conduits provided with means for regulating the temperature of said gases and dividing them into two separate currents, a producer filled with porous packing, into which said gases are led, in two separate currents, by the conduits, and a reservoir and valve for supplying a constant stream of nitric acid to the porous packing of the producer, substantially as set forth.

4. In an apparatus for the manufacture of sulphuric acid, the combination of a burner for evolving sulphurous gases, a conduit or conduits for leading said gases to a producer, a producer filled with porous packing moistened with nitric acid, a chamber or series of chambers filled with porous material, and provided with means for supplying jets of water and currents of air to the nitrous gases admitted to them, and an exhauster or fan for maintaining a constant circulation of gases through the apparatus, substantially as set forth.

5. In an apparatus for the manufacture of sulphuric acid, a chamber having its walls composed of blocks of material trapezoidal section, said blocks overlapping at their inner ends, and being built in, so that their joints shall incline inward and downward, as set forth.

143,203.—Fire-Extinguisher.—JONATHAN S. TIBBITS, Jeffersonville, Ind. Application filed September 8, 1873.

The acid-reservoir communicates with the alkali-chamber through transverse openings near the top, which are closed by suitable stoppers, or the ends of the reservoir are surrounded by sleeves forming annular air-chambers, the air in which prevents the mingling of the acid and alkali.

Claim.—1. The pipe C for containing the acid, made of lead or other non-corrosive material, arranged within the alkali-chamber of a fire-extinguisher, and made to communicate internally at both ends with the said chamber by means of transverse openings *d*, and with the external atmosphere at one or more points by means of a controlling valve or stopper, substantially as described.

2. The pipe C, arranged within the alkali-chamber E, and surrounded at its ends with the fixed case or sleeve P, to create an annular air-space, substantially as and for the purpose specified.

143,204.—Coffin.—FRANCIS TIGHE, Rockland, Me. Application filed July 8, 1873.

The cover is joined to the lid with hinges, as usual, and the edge is grooved for the admission of a tongue upon the main part of the lid. The tongue is beveled, and crowds into the groove a piece of rubber packing.

Claim.—The cover of a coffin, which is provided with a tapering tongue, *m*, which, when closed, enters a corresponding tapering groove, *n*, in the lid, the joint being also packed with a suitable material to render it air-tight, and the cover and lid being also united by hinges, as and for the purposes set forth.

143,205.—Combined Shirt-Bosom and Lungs-Protector.—WILLIS R. TRASK, Skowhegan, Me., assignor of one-third his right to THAON H. DISMORE, same place. Application filed June 14, 1873.

Claim.—1. A shirt-bosom provided with a pocket inside to receive a bosom-protector, substantially in the manner shown and described.

2. The combination with the shirt-bosom, having the pockets as described, of the protector, substantially as set forth.

143,206.—Automatic Fan.—OLIVER VANORMAN, Fond du Lac, Wis., assignor of one-half his right to HENRY HAMILTON, same place. Application filed April 7, 1873.

Claim.—The frame or stand A and shaft B, having the fans C arranged upon said shaft in a spiral form, in combination with operative mechanism, substantially as and for the purpose specified.

143,207.—Blind-Stop.—JACOB WEBER, New York, N. Y. Application filed June 2, 1873.

A small pinion-wheel upon a movable and adjustable shaft meshes with a rack-bar which is attached to and moves the sliding bar connected to all the slats of the blind. This wheel is stopped by a pin at any position, and thus holds firmly the slats at any required angle.

Claim.—The bars H and G, caps D, and blinds B, in combination with rack O, arbor M, pinion N, stud Q, and knob P, all constructed and arranged for operation as and for the purpose specified.

143,208.—Coal-Scuttle.—JOHN J. WHITE, Norfolk, Va. Application filed April 28, 1873.

A grooved ring connects the body and lower chamber and forms a support for the perforated bottom. When the bed is

tilted the ashes fall into the chamber formed on the side, thus having a clear space under the sifter.

Claim.—1. The grooved rim F, entirely surrounding the lower part of the coal-scuttle, in combination with the perforated bottom H and coal-scuttle A, when the lower edge of the latter projects nearly down to said bottom H and within the rim to confine the bottom in the groove, as and for the purpose set forth.

2. The ash-pan B, having the peculiarly-shaped chamber J on its front side, for the purpose of receiving the ashes when the scuttle is inclined, substantially as described.

143,209.—Washing-Machine.—FRANCIS M. WIDERMAN, Calverton, Md. Application filed May 3, 1873.

The washing-machine is constructed with a box or tub, with a double endless belt separated by blocks of wood, and is supported by cylinders, over which it passes, and has at or near its center a ribbed roller, which serves as a rubber in its revolution, and beyond which is a supporting-roll to give form to the belt. The journals of the supporting-roll E pass through the sides of the box in a slot, and are connected by levers to give tension to the belt.

Claim.—1. The means employed for feeding the soiled clothing beneath the beater-cylinder, consisting in the slatted supporting-belt H and I, the feed-belt or apron K, the shafts and pulleys F and G, the bars O, P, and Q, and the levers R and S, when combined to operate substantially as and for the purpose specified.

2. The slatted supporting-apron, composed of the rubber belts H and I, in the manner shown, and combined with the feed-apron K, substantially as and for the purpose described.

3. The machine as a whole, when its several parts are constructed and combined to operate substantially as and for the purpose set forth.

143,210.—Machine for Affixing Middle-Bits to Umbrella-Ribs.—ARTHUR WILSON, Birmingham, England, assignor to JAMES COMAWAY and JOHN LOCKEN, Philadelphia, Pa. Application filed November 25, 1872.

The "middle-bit" and the rib are placed upon the bed-plate and adjusted and secured together by the impact of the cuneiform blade and the pegs descending into the groove.

Claim.—A machine for affixing connections or laps on the ribs of umbrellas and parasols, composed of the metal bed A provided with a central groove, B, a set, D, the metal piece E provided with a shoulder, *b*, and terminating in the cuneiform blade F, the pegs G G, and the springs H and I, or their equivalents, arranged and constructed to operate in the manner and for the purposes substantially as described.

143,211.—Cotton-Seed Planter and Guano-Distributer.—CARLOS G. WILSON, Milledgeville, Ga. Application filed August 12, 1873.

A rock-shaft having two hand-levers, one for each hand, is arranged upon the handles of the machine. From the rock-shaft a lever extends, to which is attached a cord for lifting the coverers. An arm connects with one of the hand levers, and is also connected with the geared shaft which transmits motion from the driving-wheel to the stirring device, so that when the coverers are lifted the stirring-shaft is thrown out of gear. The regulating-slide, by its form, is adapted to sow different kinds of seed or fertiliser.

Claim.—1. The coverers R, united by a weighted cross-bar, *k*, and having shares *l*, constructed as specified, for the purposes set forth.

2. The rock-shaft S, having the pair of latch-levers A, and arranged as described, in combination with the connections *i j* for lifting the coverers by either hand.

3. The combination of the rock-shaft S with its arm *i* and latch-levers A A, the cord *j*, lever *f*, and connecting-rod *g*, for simultaneously lifting the coverers and throwing the clutch-pulley out of mesh, as set forth.

4. The regulating-slide *e*, having the lands 3 for adapting the implement to sow guano or rolled seed, when the same is constructed with the hub 1 and arm 2, as described.

143,212.—Attachment for Ladies' Work-Tables.—JOHN P. WILSON, New York, N. Y. Application filed June 25, 1873.

Claim.—The within-described attachment for ladies' work-stand, consisting, essentially, of the bed-plate A, provided with the front clamp and the curved back J, carrying the several special devices, all substantially as described and shown, and for the purpose set forth.

143,213.—Fertilizing Soil.—JOSEPH B. WILSON, Townsend's Inlet, N. J., assignor to himself and WILLIAM A. BARRETT, Philadelphia, Pa. Application filed August 12, 1873.

Claim.—As an improvement in fertilizing the soil, applying to the same crude pulverized mineral coal, with or without manure ingredients, as herein set forth.

143,214.—Hoisting-Machine.—JOHN M. YATES, Princeville, Ill. Application filed August 9, 1873.

A trestle is so combined with a hoisting apparatus that when a wagon is drawn over the trestle the hind axle will rest in a groove cut in the top of the trestle, and allow the wheels to revolve, which is used as the lever-power to hoist bags of grain, &c.

Claim.—1. In a hoisting or elevating machine, a trestle arranged to support the hind axle of a wagon for the purpose of allowing the hind wheel to be used as the lever-power of the machine, substantially as herein set forth.

2. The combination of the crane A B, slide *a*, block and tackle C, trestle D, and the hind wheel and axle of a wagon, as and for the purposes herein set forth.

143,215.—Car-Coupling.—ALBERT ZEIGLER, Cumberland, Md. Application filed July 1, 1873.

When the coupling-link enters between the spring-plate and the bottom of the draw-head it raises the plate so that the rear end of the lever to which the pin is attached is relieved, and the bolt is allowed to fall into the link.

Claim.—1. The combination of the plate *i*, spring 3, connecting-links, and levers 5 8 with the coupling-pin 9, substantially as described.

2. The combination of the head *a*, casting *c*, plate *i*, spring 3, links 4 6, levers 5 8, arm or projection 7, and pin 9, when all are arranged to operate as specified.

REISSUE PATENTS.

5,575.—Egg-Carrier.—OTIS T. BEDELL, New York, N. Y. assignor, by mesne assignments, to WILLIAM D. TABER, PHILIP P. JOSEF, and EDWARD STEIBER.—Patent No. 48,507, dated July 4, 1865. Application filed May 29, 1873.

The pockets can be made by stamping, or they may be attached to the plate A. They are of sufficient depth to hold the eggs in a vertical position, yet permit enough of the eggs to project to facilitate their removal.

Claim.—1. The egg-carrier A, having pockets B, as and for the purpose set forth.

2. The egg-carrier A, having pockets B and aperture *a*, as and for the purpose set forth.

5,576.—Curtain-Fixture.—CHARLES EATON, New York, N. Y.—Patent No. 132,453, dated October 22, 1872. Application filed July 24, 1873.

A spring-stop is interposed between the movable stops and the fixed stops, so that the concussion between the two will be greatly diminished and noise prevented.

Claim.—In a spring curtain-roller, a spring acting in conjunction with a stop or stops operated by centrifugal force, said spring serving to relieve concussion, substantially as and for the purpose specified.

5,577.—Patched Cartridge.—WILLIAM H. ELLIOT, Plattsburg, assignor to E. REMINGTON & SONS, Ilion, N. Y.—Patent No. 35,872, dated July 15, 1862. Application filed July 21, 1873.

Claim.—As a new article of manufacture, a cartridge consisting of a metallic shell, with the powder, fulminate, and bullet, having a tubular patch applied thereto, substantially as described.

5,578.—Metallic Bail-Ear.—THOMAS EVANS, Branchport, N. Y.—Patent No. 24,451, dated June 21, 1859; reissue No. 3,063, dated August 4, 1868; extended seven years. Application filed September 8, 1873.

Claim.—1. Metallic ears for attaching the handles to pails and other vessels formed with concentric annular corrugations surrounding the bail-orifice, substantially as and for the purposes set forth.

2. So arranging the hooked ends of the bail as to give them an additional bearing against one or more of said corrugations, substantially as set forth.

3. A bail-ear formed with the portion surrounding the eye raised to receive the hooked end of the bail, when the marginal portion or portions thereof are formed on the plane of the part to which they are to be attached, substantially as set forth.

4. The groove *a*, formed by a radial continuation of the outer corrugation, and fitted to embrace the side seam of a tin vessel, substantially as and for the purposes set forth.

5,579.—Fruit-Basket.—JESSE K. PARK, Marlborough, N. Y., assignor, by mesne assignments, to THE AMERICAN BASKET COMPANY, New Britain, Conn.—Patent No. 28,105, dated May 1, 1860. Application filed August 20, 1873.

Two laminæ of wood, having each their two ends slitted, are placed across each other at their middle to form the bottom of the basket. The remaining portions are then turned up and interlaced with filling, and finished at the top with a hoop, the bottom being square.

Claim.—1. In a fruit or berry basket, the laminæ of wood, *a a*, slit toward their ends and laid across each other, the slit ends being bent up, substantially as described, whereby said laminæ of wood form the solid bottom and open uprights of the basket, as set forth.

2. A fruit or berry basket in which the bottom and uprights are formed of laminæ of wood, slit toward their ends and laid across each other, and connected to a circular band at their ends, so as to assume an angular box-shape at the bottom and a round basket-shape at the top, all substantially as described.

INDEX OF INVENTIONS PATENTED SEPTEMBER 23, 1873.

	Class No.	Whole No.
Acid, manufacture of sulphuric, Thomson and Greene	35	143,202
Adding machine, S. Pool	42	143,184
Atomizer or vaporizer, J. N. Gerard	35	143,070
Auger, hollow, Fawcett, Silver, and Deming	29	143,132
Auger, well, W. L. Payne	51	143,181
Bag holder, G. W. Stricker	57	143,194
Ball ear, metallic, T. Evans, (reissue)	88	5,578
Bale tie, cotton, T. Cromer	7	143,124
Battery, galvanic, T. A. Edison	50	142,959
Bed bottom, W. H. Sears	62	143,190
Bed bottom, W. W. Skaats	62	143,035
Beer coolers, tap holder attachment for, J. H. Fisher	19	143,068
Blind stop, J. Weber	24	143,207
Boats, disengaging towing apparatus for, Wygant, Preston and Westervelt	130	143,050
Boats, flexible vertically extensible attachment for, J. R. Adams	13	143,058
Boiler, sectional steam, J. K. Abbott	148	142,976
Boilers, feed and blow off for steam, Garsed and Buck	148	143,008
Bolt threading machine, M. Hine	14	143,154
Book, indexing, J. S. Hicks	146	143,075
Boot, L. H. Farnsworth	16	143,001
Boot and shoe shanks, machine for burnishing, A. C. Carey	16	142,999
Boot and shoe soling machines, spool for, L. Goddu	16	143,137
Box former, G. W. Swan	176	143,103
Bracelet, H. A. Williams	86	143,109
Bricks by hydraulic pressure, machine for molding and pressing, E. Rogers	90	143,188
Bridge, B. F. Davis	21	143,125
Broom hanger, M. A. Clifford	22	143,063
Buckle, harness, O. B. North	72	143,180
Buckle, suspender, S. Hamm	23	143,144
Building, compound for sanitary and decorative articles used in, J. Rust	35	143,206
Building, fire-proof, L. A. Tartière	4	143,196
Building, fire-proof, L. A. Tartière	4	143,197
Button molds, tool for making, J. T. Hawkins	174	143,073
Can, oil, O. H. Warren	87	143,107
Canal boats, propelling, O. C. Smith	130	143,039
Cane juice, apparatus for extracting, D. Moffat	155	143,089
Car brake, A. Langellier	123	143,083
Car brake, E. O. Richard	123	143,187
Car coupling, W. A. Boyden	122	143,055
Car coupling, T. H. Cross	122	143,062
Car coupling, J. L. Duncan	123	142,993
Car coupling, J. F. L. Holman	122	143,011
Car coupling, G. E. Knox	122	143,165
Car coupling, Schorg and Van Valkenburg	122	143,099
Car coupling, A. Zeigler	124	143,215
Car spring, A. W. Moses	122	143,175
Cars, machine for bending truck sides for railroad, J. H. Helm	122	143,010
Carding machines, condenser for, N. Lucas	24	143,028
Carpet beater, J. Hothersall	62	143,155
Carpet lining, E. H. Bailey	95	143,053
Carpet stretcher, H. Powelson	62	143,032
Carriage foot rail, T. W. and H. K. Porter	31	143,031
Carriage holdback, D. Terry	31	143,199
Carriage top setter, J. Poffenbarger	31	143,183
Cartridge, patched, W. H. Elliot, (reissue)	33	5,577
Casting, core bar for, D. Gallagher	33	143,005
Clamp, book and paper, J. P. McLean	146	143,088
Clothes pin, H. Mellish	91	143,084
Coal scuttle, J. J. White	154	143,208
Cock, stop, C. W. Laurie	148	143,167
Coffin, F. Tighe	39	143,204
Cooking apparatus, steam, J. Lungren	88	143,171
Cotton gin, B. Hempstead	41	143,074
Cross and bowel, coopers', W. R. Davis	40	142,995
Cultivator, W. Lewis	43	143,019
Cultivator, E. P. Lynch	43	143,173
Curtain fixture, O. Eaton, (reissue)	62	5,576
Diamonds or carbon points in the face of metal tools, setting, W. McKenna	124	143,021
Double tree, W. Martin	72	143,173
Dredging scraper, D. Brobston	89	142,988
Drill for boring artesian wells, C. G. Cross	124	142,992
Egg carrier, O. T. Bedell, (reissue)	116	5,575
Elevator, G. W. Hubbard	118	143,013
Engine balance slide valve, steam, J. F. Wallace	152	143,043
Engine cylinder, steam, H. Gerner	150	143,008
Engine, rotary steam, J. V. Beekman	150	142,982
Engine, traction, L. Perkins	94	143,086
Envelope, L. Giebrich	146	143,136
Fabrics, manufacture of fur coated, H. Kellogg	38	143,163
Fan, automatic, O. Vanzetman	165	143,205
Faucet attachment, J. Church	167	143,092
Faucet, self-closing, J. W. Trafton	167	143,042
Feather renovator, L. S. Enos	93	143,130
Fence, W. F. King	52	143,161
Fertilizing solls, J. B. Wilson	96	143,213
Filter, C. Anderson	167	143,113
Fire arm, breech loading, H. H. Hopkins	18	143,012
Fire escape, L. E. Ainsworth	79	143,112
Fire extinguisher, J. S. Tibbets	35	143,203
Fire kindler, J. C. Crompton	154	143,066
Fire kindler, E. P. Wheeler	154	143,048
Fork, horse hay, J. W. Lowe	77	143,170
Fork, horse hay, I. E. Snyder	77	143,192
Fruit basket, J. K. Parks, (reissue)	63	5,579
Furnace for the manufacture of iron and steel, G. E. Harding	85	143,145
Furnace, smoke burning, S. A. Ford	154	143,064
Furnace, soldering, J. Day	136	143,126
Gaiter, W. E. Putnam	16	143,186
Game, West and Lee	143	143,047
Gas bracket, J. F. Goldthwait	64	143,138
Gas and water fittings, machine for tapping, A. D. Laws	64	143,168
Gas retorts, apparatus for charging, Somerville and Robinson	66	143,039
Generator, steam, R. Gerner	148	143,007
Gimlet handle, C. L. Griswold	29	143,142
Grate bar, H. E. Keratine	149	143,079
Grate, rocking, J. Seddon	154	143,084
Gun cleaner, C. G. Gould	55	143,139
Harvester, T. Yates	74	143,110
Heater, feed water, J. V. Beekman	148	142,983
Heel trimming machine, C. C. Ballou	16	142,989
Hemp machine, J. E. Neill	78	143,179
Hoisting machine, J. M. Yates	79	143,214
Hook, bench, D. Boyce	29	143,054
Hydrocarbon, generating and burning, C. Carpenter, Jr.	2	143,061
Ice breaker and fender, F. Ford	137	143,003
Insect destroying compound, W. C. Bibb	35	142,985
Iron and steel to anneal and toughen them, treating, A. F. Andrews	85	142,977
Jeweler's drilling device, J. K. Landermilch	109	143,084
Jeweler's hand press, J. McWilliams	86	143,023
Knitting machine, C. H. Young	89	143,051
Knobs to latches, attaching, L. Michaels	93	143,174
Ladder, fire escape, J. S. Pierson	30	143,185
Lamp, street, J. H. Eyrse	90	143,000
Lantern, W. J. Berry	90	142,984
Leather, fabric prepared to imitate, H. A. Clark	92	143,128
Lock, seal, J. E. Thomson	93	143,201
Mangle, R. A. Duncan	91	142,997
Meat mangle, S. D. Ingham	25	143,150
Medical compound, J. Fehr	96	143,133
Medical compound, U. H. Kellogg	96	143,164
Mill, fanning, L. D. Decker	159	143,127
Mosquito canopy, W. Bourgaigeon	62	143,119
Mowing machine, H. Michaux	74	143,085
Musical wind instrument, L. Fiske	102	143,143
Nail plate feeder, J. McNeely	103	143,082
Nut lock, D. Sawyer	14	143,097
Organ reeds, adjustable tongue for, M. Procopé	106	143,093
Packing, piston, J. E. Budd	151	143,057
Picture frames, device for hanging, T. C. Barnard	63	142,981
Plane, bench, C. H. Hardy	29	143,072
Plane, rabbet, F. Smith	29	143,101
Planing machine, metal, Kichner and Odenatt	109	143,080
Planter, corn, A. N. Smith	133	143,036
Planter and guano distributer, cotton seed, C. G. Wilson	133	143,211
Plow, snow, W. J. Roberts	122	143,095
Plow, wheel, J. D. Harrison	114	143,147
Pot, coffee, M. J. Stubbings	Fe	143,102
Potato bug destroyer, W. H. Myers	63	142,178
Pruning instrument, W. H. Collings	63	143,064
Pruning shears, W. E. Ball	63	143,114
Pulp, paste, or slip pigments, preservation of, P. C. Tiemann	35	143,106
Pump, barge, C. P. Gaver	118	143,009
Purifier, middlings, F. Bleckman	57	143,118
Purifiers, screen for middlings, W. W. Huntley	139	143,014
Railroad rail joint, H. Decker	120	143,096
Railroad time signal, H. H. Ford	120	143,125
Rake and tedder, combined, C. La Dow	77	143,166
Reapers, &c., coupling joint for, G. W. Sylvester	67	143,193
Refrigerator, C. Camp	58	143,060
Rein holder, Grannis and Fitch	73	143,140
Sash fastener, O. W. Noble	84	143,026
Sash holder, F. M. Davis	94	143,994
Saw, hand, T. S. Dieston	131	143,128
Saw sharpening device, J. B. Drake	131	143,057
Sawing machine, G. T. Riddle	130	143,033
Scales, weighing, W. Z. Conner	139	143,991
Scraper, W. E. and F. A. Jacobs	114	143,018
Separator, grain, J. Keons	150	143,081
Sewing machine, J. P. Noyes	134	143,027
Sewing machine fan attachment, R. Jackson	134	143,015
Sewing machine hemmer, J. F. Johnson	134	143,160
Sewing machine quilting attachment, W. H. Noll	134	143,028
Sewing machine needle threader, T. Schofield	134	143,098
Sewing machine shuttle, W. H. Thayer	134	143,104
Sewing machine thread cutting mechanism, A. Webber	134	143,046
Sewing machines, gathering and ruffling attachment for, J. Wise	134	143,049
Shaft, tumbling, D. Snell	67	143,191
Sheet metal, riveting joints of, P. Ball	136	142,979
Shirt, W. B. Watson	38	143,108
Shirt bosom and lung protector combined, W. R. Trask	38	143,205
Shoe fastening, G. B. Hart	16	143,146
Shovel, fire, F. M. Ketcham	154	143,018
Shutter fastener and bower, combined, R. Ruhlman	24	143,199
Shutter, fire-proof, T. Hyatt	4	143,158

	Class No.	Whole No.
Shutter, fire-proof, T. Hyatt	4	143,157
Shutter worker, J. W. Jedkins	24	143,159
Sifter, sand, D. Brobston	170	143,987
Skirt, W. S. Taylor	38	143,198

Steering apparatus, H. Keen	137	143,017
Steering apparatus, W. E. Thomas	137	143,200
Stove pipe connection, G. F. Brinkerhoff	154	143,120
Strainer, cream, R. W. Barnard	45	143,115
Streets of snow, machine for clearing, W. E. Musgrove	110	143,176
Stump extractor, W. Duffner	79	143,129
Sword blades, machine for rolling, J. C. Richardson	100	143,094
Table, ironing, Grosh and Foreman	91	143 071
Table, work, J. P. Wilson	38	143,212
Tanning compound, W. Thilmany	35	143,105
Tent, J. B. Smith	162	143,037
Thill coupling, H. B. Kinney	31	143,162
Tire heater, R. F. Thompson	60	143,041
Trap, animal, D. A. Leach	143	143,169
Toy dancer, automatic H. L. Brower	143	143,121
Toy dancer, automatic, W. A. P. La Grove	143	143,062
Toy whistle, J. Waters	143	143,044
Umbrella ribs, machine for affixing middle bits to, A. Wilson	165	143,210
Valve, balanced, J. H. Stombs	152	143,193
Valve, governor, H. B. Weaver	152	143,045
Vehicle spring, G. W. Lewis	31	143,085
Vehicle wheel, R. R. Jones	31	143,077
Vehicle wheel, R. R. Jones	31	143,078
Vehicle wheel, T. W. Porter	31	143,029
Vessel, covered, W. Bates	88	143,116
Vessels, device for raising sunken, L. W. Briggs	82	143,056
Vessels, propelling mechanism for, L. Murdock	139	143,091
Vest, lady's under, O. P. Flynt	38	143,002
Violin, J. Belknap	102	143,117
Wagon, T. W. Porter	31	143,030
Wagon, F. Post	31	143,185
Wagon body, B. Burr	31	142,969
Wagon boxes to the bolsters, holding, H. L. Anderson	31	142,978
Wagon seat, M. Likes	31	143,086
Washing machine, A. M. Campbell	91	143,060
Washing machine, Calvin and Patchen	91	143,123
Washing machine, D. B. Myers	91	143,177
Washing machine, F. M. Widerman	91	143,209
Watchmaker's chain clamp, C. E. Evard	86	143,131
Water cooler, I. Brach	58	142,966
Water cooler, J. E. Cammeyer	58	143,058
Water wheel, J. Taney	168	143,040
Wheel, fly, H. Gerner	67	143,009
Whip, F. P. Cosco	79	143,065
Wick raiser, Hallas and Weeden	90	143,143
Windmill, J. Q. and H. R. Adams	118	143,111
Windmill, J. Hoag	118	143,076
Wind wheel, E. and D. Shepler	118	143,100
Wire ways, saddle for, T. M. Martin	122	143,087

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED SEPTEMBER 23, 1873.

Abbott, J. K., Sectional steam boiler	142,976
Adams, J. Q. and H. R., Windmill	143,111
Adams, J. M., Flexible vertically-extensible attachment for boats	143,052
Ainsworth, L. E., Fire escape	143,112
American Basket Company, assignee, (reissue)	5,579
American Cable Screw Wire Company, assignee	143,137
Anderson, C., Filter	143,113
Anderson, H. L., Holding wagon boxes to the bolsters	142,978
Andrews, A. F., Treating iron and steel to anneal and toughen them	142,977
Andrews Manufacturing Company, assignee	142,977
Bailey, E. H., Machine for manufacturing carpet lining	143,053
Ball, P., Riveting joints of sheet metal	142,979
Ball, W. E., Pruning shears	143,114
Ballou, C. C., Heel trimming machine	142,980
Barrett, W., assignee	143,213
Barnard, R. W., Cream strainer	143,115
Barnard, T. C., Hanging picture frames	142,981
Barr, J. H., assignee	143,086
Beton, W., Covered vessel	143,116
Bedell, O. T., Egg carrier, (reissue)	5,575
Beekman, J. V., Rotary steam engine	142,982
Beekman, J. V., Feed water heater	142,983
Belknap and Burnham Manufacturing Company, assignee	143,166
Belknap, J., Violin	143,117
Benedict and Burnham Manufacturing Company, assignee	143,143
Berry, W. J., Lantern	142,984
Bibb, W. C., Insect destroying compound	143 985
Bleckman, P., Middlings purifier	143,118
Bolles, T., assignee	143,197
Boot and Shoe Improvement Company, assignee	143,091
Bourgnignon, W., Mosquito canopy	143,119
Boyce, D., Beach hook	143,054
Boyden, W. A., Car coupling	143,055
Brach, I., Water cooler	142,966
Briggs, L. W., Raising sunken vessels	143,056
Brinkerhoff, G. F., Stove pipe connection	143 120
Brobston, D., Sand sifter	142,987
Brobston, D., Dredging scraper	142,988
Brower, H. L., Automatic toy dancer	143,121
Buck and Garsed	143,006
Budd, J. C., Piston packing	143 057
Burr, B., Wagon body	142,969
Cammeyer, J. E., Water cooler	143,058
Camp, C., Refrigerator	143,059
Campbell, A. M., Washing machine	143,060
Carey, A. C., Machine for burnishing boot and shoe soles	142,990
Carpenter, C., Jr., Generating and burning hydrocarbon	143,061
Church, J., Faucet attachment	143,062
Cilley, J. J., assignee	143,104
Clark, H. A., Fabric prepared to imitate leather	143,122
Clifford, M. A., Broom hanger	143,063
Cole, J. R., assignee	143,171
Collings, W. H., Pruning instrument	143,064
Colvin, T., and R. M. Patchen, Washing machine	143,123
Conaway, J., assignee	143,210
Conner, W. Z., Weighing scales	142,991
Couse, F. P., Whip	143,065
Crane, J. S., assignee	143,051
Cromer, T., Cotton bale tie	143,124
Crosa, C. G., Drill for boring artesian wells	142,992
Cross, T. H., Car coupling	142,993
Crumpton, J. C., Fire kindler	143,066

Yates, T., Harvester	143,110
Young, C. H., Knitting machine	143,051
Zeigler, A., Car coupling	143,215

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant thereof, unless he shall make a new application within two years from the date of notice of the original allowance.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1873, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of those classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)..... 6,500
SEWING-MACHINES and attachments..... 2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes..... 4,000
PRINTING; including presses, type, and printers' furniture. 2,500
FELTING and HATS; including caps, bonnets, flock, &c..... 1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)..... 1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs..... 1,400
CARRIAGES and WAGONS..... 6,000
RAILWAYS, (in progress.)
BRIDGES, (in progress.)
CARDING, CLOTH CORDAGE, KNITTING, SILK, SPINNING, WEAVING, (in progress.)

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Aërated liquor apparatus	1	Leather	93
Air and gas engines	2	Locks and latches	93
Amalgamators, ore-mills	3	Locomotives	94
Architecture	4	Looms	95
Artificial limbs, &c.	5	Measures	96

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 14. TUESDAY, SEPTEMBER 30, 1873. PRICE { $5.00 per year—single. $4.00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DIGEST OF FOREIGN PATENT LAWS.

FRANCE.

REPORT BY H. WODEHOUSE, OF THE BRITISH LEGATION.

The former legislation with regard to inventions was revised by the Chamber of Deputies, and a new law passed on the 5th of July, 1844.

This law, comprising the whole subject, takes the place of all prior regulations and still remains in force.

It is based on the principle that patents for inventions are only applicable to discoveries relating to industrial arts, and that the said titles are to be delivered without preliminary examination.

Patents are not granted for pharmaceutical preparations or remedies of any kind; nor for financial schemes. As regards the former, the law on the subject prescribes that all pharmaceutical remedies must be submitted to examination by the faculty of medicine, and, unless duly authorized, their sale is illegal. They cannot be protected otherwise than by trade-marks.

Patents can be taken out for the terms of five, ten, or fifteen years, subject, respectively, to a tax, 500, 1,000, or 1,500 francs—say, $100, $200, or $300—payable by annual instalments of $20, due before the expiration of each year. If not paid within the term the patent is forfeited.

Applicants for patents having paid the first annual fee to the treasury, or, if not in Paris, to the Receiver General of the Department in which they are domiciled or elect to be domiciled, must deliver at the office of the Secretary of the Prefecture the receipt for the above payment, to which must be affixed a stamp of 25 centimes and a sealed packet containing—

1. Their petition to the Minister of Agriculture and Commerce.

2. A description of the invention written in French and in duplicate.

3. A drawing or sample in duplicate.

4. A memorandum of the documents delivered, all of which must be signed by the applicant or his representative.

A declaration, entered in a special register and signed by the applicant, records the day and hour of the deposit being made, and the duration of the patent commences from that date. A copy of the declaration is delivered to the applicant on paying the stamp, which costs thirty cents.

All applications must be transmitted from the prefecture to the Minister of Commerce within five days of their being deposited there, and the letters patent are granted by the minister according to the order in which they are received at the ministry. One copy is presented to the patentee gratis, and, if the patent cannot be granted, the amount of the tax is refunded.

The duration of the patent can only be prorogued by special act of the legislative assembly, and such cases are of rare occurrence.

Certificates of addition for improvements connected with the patented invention are obtained in the same way and by the same formalities as in taking out a patent. They have the same force as the original title, and are granted to the patentee or his assigns at any time during the continuance of the privilege. Those filed by one of the assigns are to the advantage of all the others. Each certificate of addition is subject to a tax of $4, and to the charge of five cents for the cost of the stamp. Instead of a certificate of addition expiring with the original patent, the patentee can, if he wishes,

take out a distinct patent of improvement for the term of five, ten, or fifteen years. Any person is, however, at liberty to file applications for patents of improvement on the already-projected invention; but when such applications are lodged within the first year of the patent, they are kept under seal until this term has expired, and the privilege is then only accorded in the event of the original patentee having failed to claim the same improvements by application for a certificate of addition or new patent filed in the interval. When such an application is filed by the patentee it takes precedence over all others of similar nature.

Assignments, to be valid, must be passed before a public notary, and afterward registered at the prefecture of the department. Before the registration is effected the tax for the remainder of the years during which the patent has to run at the moment of the transfer must be paid into the treasury. Changes in the proprietorship of the patents are inscribed in a register at the ministry of commerce.

The assignees and licensees of a patent have the full benefit of all certificates of addition subsequently granted to the patentee, and, on the other hand, the patentee has the benefit of those granted to the assignees. It has been remarked that this article is open to the objection that the patentee can evade the first clause of it by taking out a distinct patent of improvement.

The specifications, drawings, and specimens of the patented inventions are open to public inspection at the ministry of commerce. After payment of the second annuity the text or extracts of the descriptions and drawings are published, and a catalogue of the patents delivered is issued annually.

Foreigners can obtain patents on the same terms as natives. In the case of imported inventions the duration of the patent is limited by the prior foreign privilege.

The patent is null if the invention is not new—that is to say, if publicity has been previously given to it in France or abroad;

If it is not patentable, according to the terms of Article III;

If not shown to be applicable to industry;

If prejudicial to public morals;

If the patent has been obtained under a fraudulent title or contrary to the provisions of Article XVIII;

Or if the description given of the invention is not true and complete.

Certificates of addition are also null when they do not properly refer to the patent.

The patentee forfeits his rights if the invention is not worked within two years of the signature of the patent, or if not worked at any time for a period of two years. He also forfeits them if articles made abroad similar to those patented are introduced into France, unless they are introduced as models under a special authorization. In making mention of his title or of his patent the patentee must add the words "without guarantee of government." The penalty for not doing so is a fine of from $10 to $200, which may be doubled in case of a repetition of the offence. This formula is intended to denote that the patent has been granted without preliminary examination, and that the government is not involved in any responsibility on its account.

Actions for annulment or forfeiture are brought before the civil tribunals of first instance, and are conducted in the ordinary form of civil procedure for summary matters.

Actions for infringement of the rights of the patentee are tried before the "Tribunal Correctionel," (court for trial of misdemeanors,) according to the prescriptions of the penal code. The offender is liable to a fine of from $20 to $400, and, in case of a repetition of the offence, to an imprisonment of from one to six months.

The patentee can obtain an order from the President of the Tribunal for the Seizure of Counterfeits, and the confiscated articles are delivered to him without prejudice to his claiming greater damages.

The application of the patent law to the Colonies is confirmed and regulated by a decree dated October 31, 1848.

The petition, accompanied by the description and drawing of the invention, is delivered at the office of the Director of the Interior, by whom it is forwarded to the Minister of Agriculture and Commerce through the Minister of Marine and the Colonies. Actions for infringement are tried before the court of appeal in the colony.

It will be observed that the taxes imposed by the government in France, viz., for a patent, annuity, and stamp, 100 francs, 25 centimes—say $20; for a certificate of addition, tax, and stamps, 20 francs, 25 centimes—say $4.00—are small as compared with those to which applicants are subject in most other countries, and amount to considerably less than the cost of letters patent in Great Britain.

Various amendments of the law have been at different times in contemplation, but none have hitherto been carried into effect.

ANNEXE I.

CHAPTER I.—GENERAL PROVISIONS.

ARTICLE I. Every new discovery or invention in all departments of industry confers upon its author, under the conditions and for the time hereafter mentioned, the exclusive right of working for his own profit the said discovery or invention.

This right is established by deeds delivered by the government, under the name of patents of invention.

ART. II. The following shall be considered as new inventions or discoveries:

The invention of new industrial products;

The invention of new means, or the new application of known means, for obtaining an industrial result or product.

ART. III. The following shall not be patentable:

1. Pharmaceutical compositions or remedies of all kinds, the said objects remaining subject to the special laws and regulations for these matters, and especially to the decree of the 18th of August, 1810, relating to secret remedies.

2. Schemes and combinations relating to credit and finances.

ART. IV. The duration of the patents shall be five, ten, or fifteen years.

Every patent shall be subject to the payment of a tax, fixed as follows:

500 francs, say, $100, for a patent of five years.

1,000 francs, say, $200, for a patent of ten years.

1,500 francs, say, $300, for a patent of fifteen years.

This tax shall be paid by yearly instalments of 100 francs, say, $20, under penalty of forfeiture if the patentee allows one year to elapse without paying the tax.

CHAP. II.—FORMALITIES RESPECTING THE DELIVERY OF LETTERS PATENT.

SECTION 1.—*Demands for Patents.*

ART. V. Any person who shall wish to obtain a patent of invention must deposit, under a sealed cover, at the office of the Secretary of the Prefecture, in the department in which he is domiciled, or in any other department in which he may elect to be domiciled—

1. His petition to the Minister of Agriculture and Commerce;

2. A specification of the discovery, invention, or application forming the subject of the petition;

3. The drawings or specimens necessary for the comprehension of the specification; and

4. A memorandum of the documents deposited.

ART. VI. The demand must be limited to a single principal object, with the details that constitute it, and the applications, which shall be indicated.

It must mention the duration which the applicants wish to assign to their patent in the limits fixed by Article IV, and must contain neither restrictions, conditions, nor reservations.

It must set forth a title, containing a compendious and precise designation of the object of the invention.

The specification must not be written in a foreign language. It must be without alterations, or words written over others. The words that have been obliterated must be counted and verified. The pages and references must be initialed. It must not contain any denomination of weights and measures other than those inserted in the table annexed to the law of the 4th July, 1847.

The drawings must be made in ink, and according to a metrical scale.

A duplicate of the specifications and drawings must be added to the petition.

All documents must be signed by the applicant, or by his proxy, whose power of attorney must be annexed to the petition.

ART. VII. No deposit can be received except on the production of a receipt proving the payment of a sum of 100 francs, say, $20, on account of the tax on the patent.

A declaration, entered gratis by the Secretary-General of the Prefecture in a special register, and signed by the applicant, shall authenticate every deposit, indicating the day and hour when the documents were delivered.

A copy of the said declaration shall be delivered to the depositor on paying the cost of the stamp.

ART. VIII. The duration of the patent is to begin from the day on which the deposit is made, according to Article V.

SECTION 2.—*Delivery of Patents.*

ART. IX. Immediately after the registration of the petition, and within five days from the date of the deposit, the prefects are to transmit the documents, under the seal of the inventor, to the Minister of Agriculture and Commerce, together with a certified copy of the declaration of the deposit, the receipt proving the payment of the tax, and, if there be one, the power of attorney, mentioned in Article VI.

ART. X. On the arrival of the documents at the Ministry of Agriculture and Commerce they are to be opened, the petitions registered, and the letters patent delivered, according to the order in which the said petitions have been received.

ART. XI. The patents demanded in due form shall be delivered, without previous examination, at the applicant's own risk, and without guarantee as to either the reality, novelty, or merit of the invention, or the accuracy or exactness of the description.

An order of the ministry, proving the regularity of the demand, shall be delivered to the applicant, and constitute the patent of invention.

To this order shall be annexed the certified duplicate of the specification and drawings, (mentioned in Article VI,) after its conformity with the original has been verified, and, if necessary, authenticated.

The first copy of the patent is to be delivered gratis.

All subsequent copies required by the patentee or his representatives shall be subject to a payment of 25 francs, say, $5.00.

The cost for drawings, if any, shall be paid by the applicant.

ART. XII. All applications in which the formalities prescribed by Nos. 2 and 3 of Article V, and by Article VI, have not been observed, shall be rejected.

One-half of the sum paid shall belong to the treasury; but the whole sum shall be carried to the account of the applicant, if he renews his application within the term of three months, reckoning from the date of the rejection of his application.

ART. XIII. Whenever, in pursuance of Article III, a patent cannot be granted the tax shall be repaid.

ART. XIV. A royal ordinance, inserted in the "Bulletin des Lois," shall publish every three months the patents delivered.

ART. XV. The duration of patents can only be extended by a special law.

SECTION 3.—*Certificates of Addition.*

ART. XVI. The patentee or his assigns shall be entitled during the whole term of the patent to make alterations, improvements, or additions to the invention, by complying, on the deposit of the petition, with the formalities prescribed by Articles V, VI, and VII.

These alterations, improvements, or additions shall be authenticated by certificates, delivered in the same form as the principal patent, and having from the re-

spective dates of the petitions and their delivery the same effects as the said principal patent, with which they will expire.

Every application for a certificate of addition shall be subject to the payment of a tax of 20 francs.

Certificates of addition filed by one of the assigns shall be to the advantage of all the others.

ART. XVII. Every patentee who, for an alteration, improvement, or addition, wishes to take a principal patent for five, ten, or fifteen years, instead of a certificate of addition expiring with the original patent, must comply with the formalities prescribed by Articles V, VI, and VII, and pay the tax mentioned in Article IV.

ART. XVIII. None but the patentee or his representatives, acting as above mentioned, can, during one year, legally obtain a patent for an alteration, improvement, or addition to the invention which forms the subject of the original patent.

Nevertheless, any person who shall wish to obtain a patent for an alteration, addition, or improvement in the discovery already patented, may, during the said year, make an application, which shall be transmitted to and remain under seal at the Ministry of Agriculture and Commerce.

At the expiration of the year the seal shall be broken and the patent delivered.

Nevertheless, the original patentee shall have the preference for all alterations, improvements, and additions for which he shall have demanded, during that year, a certificate of addition or a patent.

ART. XIX. Whoever has taken a patent for a discovery, invention, or application connected with the subject of another patent, shall have no right to work the invention already patented; and again, on the other hand, the original patentee cannot work the invention which forms the subject of the new patent.

SECTION 4.—*Assignment and Transfer of Patents.*

ART. XX. Every patentee may transfer the whole or part of the proprietorship of his patent.

The transfer of a whole or part of a patent, either gratuitously or for a consideration, can only be effected by a notarial deed, and after the payment of the whole of the tax prescribed by Article IV.

No transfer shall be valid, as regards a third party, before it has been registered at the secretary's office of the prefecture of the department in which the deed has been executed.

The registration of transfers and all other acts concerning mutations shall be made on the production and deposit of an authentic extract from the deed of transfer or mutation.

A copy of each declaration of registration, together with the extract from the deed above mentioned, shall be forwarded by the Prefects to the Minister of Agriculture and Commerce within five days of the date of the declaration.

ART. XXI. There shall be kept at the ministry of agriculture and commerce a register in which shall be inscribed the changes in the proprietorship of each patent, and every three months a royal ordinance shall be published, in the form prescribed by Article XIV, containing the mutations registered during the expired quarter.

ART. XXII. The assignees of a patent, and those who may have acquired from a patentee or his representatives the power to work the discovery or invention, shall have the full benefit of the certificates of addition which may be delivered to the patentee or his representatives at a later period. On the other hand, the patentee or his representatives shall have the benefit of the certificates of addition, which may be at a later period delivered to the assignees.

All those who may have a right to profit by the certificates of addition may obtain a copy at the Ministry of Agriculture and Commerce by paying a fee of twenty francs, say, $4,00.

SECTION V.—*Inspection and Publication of Specifications and Drawings of Patents.*

ART. XXIII. The specifications, drawings, specimens, and models of the patents delivered shall, until the expiration of the patents, remain deposited at the Ministry of Agriculture and Commerce, where they may be inspected by every applicant.

Any person may obtain, at his own expense, a copy of the said specifications and drawings, according to the forms established by the regulations prescribed in accordance with Article L.

ART. XXIV. After the payment of the second annuity the specifications and drawings shall be published either in the full text or by extracts.

Moreover, at the beginning of each year a catalogue shall be published, containing the titles of the patents delivered in the course of the preceding year.

ART. XXV. The collection of specifications and drawings, and the catalogue published according to the preceding article, shall be deposited at the Ministry of Agriculture and Commerce, and at the secretary's office of the prefecture of each department, where they may be inspected free of charge.

ART. XXVI. On the expiration of the patents the original specifications and drawings shall be deposited in the "Conservatoire des Arts et Métiers."

CHAP. III.—RIGHTS OF FOREIGNERS.

ART. XXVII. Foreigners can obtain patents of invention in France.

ART. XXVIII. All formalities and conditions prescribed by the present law shall be applicable to patents demanded or delivered in compliance with the preceding article.

ART. XXIX. The author of an invention or discovery already patented abroad may obtain a patent in France, but the duration of such patent cannot exceed that of the patents previously obtained abroad.

CHAP. IV.—ANNULMENTS AND FORFEITURES, AND ACTIONS RELATING THERETO.

SECTION 1.—*Annulments and Forfeitures.*

ART. XXX. Patents delivered under the following circumstances shall be null and void:

1. Whenever the discovery, invention, or application is not new.

2. Whenever the discovery, invention, or application is not patentable according to Art. III.

3. Whenever patents refer to theoretic or purely scientific principles, methods, systems, discoveries and conceptions, the industrial applications of which are not indicated.

4. Whenever the discovery, invention, or application is known to be contrary to public order or safety, to

morals, or to the laws of the country, without prejudice in such a case, and in that of the fourth paragraph, to penalties which might be incurred for manufacturing or selling prohibited articles.

5. Whenever the title under which the patent has been demanded indicates fraudulently any other object than the real object of the invention.

6. Whenever the specification annexed to the patent is not sufficient for working the invention, or whenever it does not point out completely and fairly the real means employed by the inventor.

7. Whenever the patent has been obtained contrary to the provisions of Art. XVIII.

Certificates comprising alterations, improvements, or additions which are not connected with the original patent shall be likewise considered null and void.

ART. XXXI. Any discovery, invention, or application to which, in France or abroad, and previously to the date of the deposit of the petition, sufficient publicity has been given to enable the same to be worked, shall not be considered as new.

ART. XXXII. The following shall forfeit all their rights:

1. The patentee who has not made his annual payment before the commencement of each year of the term of his patent.

2. The patentee who has not worked his discovery or invention in France within two years from the date of the signature of his patent, or who has ceased to work it during two consecutive years, unless, in one or the other case, he justifies himself as to the causes of his inaction.

3. The patentee who has introduced into France objects manufactured abroad and similar to those which are protected by his patent.

Models of machines, of which the Minister of Agriculture and Commerce may authorize the introduction, pursuant to Art. XXIX, are excepted from the provisions of the preceding paragraph.

ART. XXXIII. Whoever, in signboards, advertisements, prospectuses, placards, marks, or stamps, calls himself patentee without possessing a patent delivered in conformity with the law, or after the expiration of a former patent, or who, being a patentee, mentions his title of patentee or of his patent without adding the words, "without guarantee of the government," shall be subject to a fine of from 50 to 1,000 francs—$10 to $200. In the case of a repetition of the offence the fine may be doubled.

SECTION 2.—*Actions for Annulment and Forfeiture.*

ART. XXXIV. Actions for annulment or forfeiture may be brought into court by all parties having an interest therein.

These actions, as well as all contestations relating to the proprietorship of patents, shall be brought before the "Tribunaux Civils de Première Instance."

ART. XXXV. Whenever an action is brought at the same time against the patentee and against one or several assignees of parts of the patent, it shall be brought before the tribunal of the place where the patentee is domiciled.

ART. XXXVI. The case shall be tried and adjudicated in the form prescribed for summary matters by Art. CCCCV, and the following articles of the Code of Civil Procedure. It shall be communicated to the Procureur du Roi.

ART. XXXVII. In every action tending to a judgment of annulment or forfeiture of the patent, the public prosecutor may intervene and require the patent to be pronounced absolutely annulled or forfeited.

He may even sue directly by principal action, in order to have the annulment pronounced in the cases provided against in Nos. 2, 4, and 5 of Art. XXX.

ART. XXXVIII. In the cases coming under Art. XXXVII, all assigns whose titles have been registered at the Ministry of Agriculture and Commerce, in conformity with Art. XXI, are to be included in the suit.

ART. XXXIX. Whenever the absolute annulment or forfeiture of a patent has been pronounced by a judgment or decision which has acquired the force of a final adjudication, due notice shall be given to the Minister of Agriculture and Commerce, and the annulment or forfeiture shall be published in the form prescribed by Art. XIV, making patents public.

CHAP. V.—FRAUDULENT IMITATIONS.—PROSECUTIONS AND PENALTIES.

ART. XL. Every infringement of the rights of a patentee, either by the manufacture of products, or by the employment of means which constitute the subject of his patent, constitutes the offence of a fraudulent imitation.

This offence shall be punished by a fine of from 100 francs to 2,000 francs—say, $20 to $400.

ART. XLI. Those who have knowingly received, sold, or offered for sale, or introduced into the French territory, one or more counterfeit articles, shall be liable to the same penalties as the infringers.

ART. XLII. The penalties established by the present law cannot be accumulated.

The highest penalty shall alone be inflicted for all offences previous to the first action.

ART. XLIII. In the case of a repetition of the offence, an imprisonment of from one to six months shall be inflicted, besides the fine established by Arts. XL and XLI.

It shall be considered a repetition of the offence, whenever the accused party in the five preceding years has undergone a first sentence for one of the offences coming under the present law.

An imprisonment of from one to six months shall also be inflicted whenever the infringer is a workman, or a person employed in the workshops or establishment of the patentee; or whenever the infringer, being in partnership with a workman or person employed by the patentee, has become acquainted through the latter with the processes described in the patent.

In the latter case the workman or person employed may be prosecuted as an accomplice.

ART. XLIV. Art. CCCCLXIII of the Penal Code may be applied to the offences to which the preceding provisions relate.

ART. XLV. The action for a misdemeanor, involving the application of the above penalties, can only be brought by the Public Prosecutor at the demand of the injured party.

ART. XLVI. The court for the trial of misdemeanors, before which an action for infringement is brought, shall decide as to the objections raised by the accused

party, respecting either the nullity or forfeiture of the patent, or the questions relating to the proprietorship of the said patent.

ART. XLVII. The proprietors of the patent may, by virtue of an order of the President of the Tribunal de Premiére Instance, proceed through the agency of the officers of the court to have the objects supposed to be counterfeit pointed out and fully described, with or without seizure.

This order shall be issued on a simple application, and on the production of the patent; it shall contain, if requisite, the nomination of an expert to assist the officer in his description.

Whenever a seizure is to be made the said order may impose on the applicant a security, which he must furnish before proceeding in the matter.

Security shall always be required from a foreign patentee who may demand a seizure.

A copy shall be left with the holder of the objects described or seized, both of the order and of the deed, certifying that the security, if required, has been deposited, under pain of annulment of the proceedings, and an action for damages against the officer.

ART. XLVIII. In default of the applicant suing either by civil or criminal proceedings, within eight days, besides one day for every three myriamètres distance between the place where the objects seized or described are, and the domicile of the infringer, receiver, importer, or seller, the seizure or description shall be legally void, without prejudice to the damages which may be claimed, if required, in the form prescribed by Article XXXVI.

ART. XLIX. The confiscation of the articles known to be counterfeit, and if requisite, that of the instruments or utensils specially designed for manufacturing them, shall, even in a case of an acquittal, be pronounced against the infringer, the receiver, importer, or seller.

The confiscated objects shall be delivered to the proprietor of the patent, without prejudice to his claiming greater damages, and, if the circumstances allow it, to his having the judgment posted up.

CHAP. VI.—SPECIAL AND TRANSITORY PROVISIONS.

ART. L. Royal ordinances for the regulation of the public administration, shall establish the necessary provisions for the execution of the present law, which shall not come into force until three months after its promulgation.

ART. LI. Ordinances delivered in the same form shall regulate the application of the present law in the colonies, with the modifications which may be judged necessary.

ART. LII. From the day on which the present law comes into operation, shall be abrogated—the laws of the 7th of January and the 25th of May, 1791; that of the 20th of September, 1792; the decision of the 17th Vendémiaire of the year 7; the decision of the 5th Vendémiaire of the year 9; the decrees of the 25th of November, 1808, and 25th of January, 1807, and all provisions anterior to the present law, relating to patents of invention, importation, and improvement.

ART. LIII. The patents of invention, importation, and improvement, at present in force, delivered in conformity with the laws anterior to the present, or prolonged by royal ordinance, shall continue in force during the time originally assigned to them.

ART. LIV. All proceedings commenced before the promulgation of the present law shall be terminated in accordance with the anterior laws.

All actions, either for annulment or forfeiture of a patent not yet commenced, shall be concluded according to the provisions of the present law, even if they refer to patents delivered previously.

The present law, which has been discussed, deliberated upon, and adopted by the Chamber of Peers and the Chamber of Deputies, and this day sanctioned by us, shall come into force as a law of the State.

ANNEXE 2.

Table of weights and measures (with their English equivalents) as fixed by the law of July 4, 1837, mentioned in Art. VI of the patent law.

	French measures of length.	
	In English inches.	In English feet = 12 inches.
Millimètre	0.03937	0.003281
Centimètre	0.39371	0.032809
Décimètre	3.93708	0.328089
Mètre	39.37079	3.280899
Décamètre	393.70790	32.808992
Hectomètre	3937.07899	328.089917
Kilomètre	39370.79000	3280.899167
Myriamètre	393707.90000	32808.991667

	French measures of length.		
	In English yds. = 3 feet.	In English fathoms = 6 feet.	In English miles = 1760 yards.
Millimètre	0.0010936	0.0005468	0.0000006
Centimètre	0.0109363	0.0054682	0.0000062
Décimètre	0.1093633	0.0546816	0.0000621
Mètre	1.0936331	0.5468165	0.0006214
Décamètre	10.9363306	5.4681653	0.0062138
Hectomètre	109.3633056	54.6816528	0.0621369
Kilomètre	1093.6330556	546.8165278	0.6213684
Myriamètre	10936.3305556	5468.1652778	6.2136842

1 inch = 2.539654 centimètres. 1 yard = 0.9143635 mètre.
1 foot = 3.0479449 décimètres. 1 mile = 1.6093149 kilomètres.

	French measures of surface.	
	In English square feet.	In English square yards = 9 square feet.
Centiare or square mètre	10.764299	1.196033
Are or 100 square mètres	1076.429934	119.603326
Hectare or 10,000 square mètres	107642.993419	11960.332602

	French measures of surface.		
	In English poles = 272.25 square feet.	In English roods = 10,890 square feet.	In English acres = 435.60 square feet.
Centiare or square mètre	0.0395363	0.0009085	0.0002471
Are or 100 square mètres	3.9536289	0.0908457	0.0247114
Hectare or 10,000 sq. mètres	395.3628930	9.0845794	2.4711431

1 square inch = 6.4513889 square centimètres.
1 square foot = 9.2903609 square décimètres.
1 square yard = 0.83609715 square mètre or centiare.
1 acre = 0.40467169 hectare.

French measures of capacity.

	In cubic inches.	In cubic feet = 1728 cubic ins.
Millilitre or cubic centimètre	0.06103	0.000035
Centilitre or 10 cubic centimètres	0.61027	0.000353
Décilitre or 100 cubic centimètres	6.10271	0.003530
Litre or cubic décimètre	61.02705	0.035317
Décalitre or centistère	610.27049	0.353166
Hectolitre or décistère	6102.70515	3.531659
Kilolitre or stère or cubic mètre	61027.05150	35.316581
Myrialitre or décastère	610270.51519	353.165807

	In pints = 34.65923 cubic inches.	In gallons = 8 pints = 277.27384 cubic inches.	Bushel = 8 gallons = 2218.19075 cubic inches
Millilitre or cubic centimètre	0.00176	0.0006301	0.0000795
Centilitre or ten cubic centimètres	0.01761	0.0063010	0.0007951

COMMISSIONER'S DECISIONS.

WILLIAM L. SMITH.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of William L. Smith for Letters Patent for* IMPROVEMENT IN HYDRAULIC ENGINES.—*Decided September 30, 1873.*]

A device for pumping water from below a water-wheel by hand, to operate the wheel and drive heavy machinery, commented upon, and held to be without the requisite utility to warrant the grant of a patent, because involving the perpetual-motion delusion and a defiance of physical law, and not being an adaptation of means to the end sought.

Section 31 of the patent act, requiring that an invention shall be "sufficiently useful and important" in order to be patentable, should be rarely invoked to defeat an application, and should be applied with caution. The mere fact that but little invention is shown, or that a device is small and apparently trifling, is not proper ground for applying it.

LEGGETT, *Commissioner:*

This case exhibits one of those projects akin to the attempts in which men sometimes engage, in defiance of immutable physical law, with the vain hope of achieving perpetual motion. The applicant proposes to elevate water from a vat by means of hand-pumps, and deliver it into a trough that will convey it upon an overshot water-wheel, the wheel being thereby operated, and the water returned to the vat, to be again raised and used, as before. He ignores the fact that the power he employs to apply the water to the wheel must be not only equal to that which he can derive from the operation of the wheel, but greater, for the reason that the friction of the machinery is against him, and the water must be raised from below the lower bucket of the water-wheel to a point above the upper bucket.

If hand-power is sufficient to operate the pumps to convey an adequate amount of water to run the water-wheel, then the same hand-power is more than sufficient to operate the same wheel by direct application, without the intervention of pumps and water, and the consequent loss of power through friction, &c. The invention is an apparatus for losing, rather than for gaining, power.

It does not alter the case that applicant's lever is vertical and weighted at the lower end, and denominated a pendulum—for it is only a pump-handle after all. He says, "When this pendulum is started it will vibrate a long time, and raise water at every stroke through the medium of the pumps"—the old perpetual-motion delusion. The absurdity of the proposition that the mere oscillation of the pendulum pump-handle by hand will be sufficient to raise water to operate machinery of the nature contemplated is too bald to call for argument to refute it. The simplicity of the following statement would be amusing were it not so earnestly advanced: "It is confidently believed that a machine embodying my invention can be constructed of sufficient capacity to drive a quartz-mill with ease, having five or more stampers of the largest size, using the water over and over again." All this is to be done by hand-power through the vibration of a weighted pump-handle. The applicant ignores the mechanical law that action and reaction are equal in opposite directions, and his production belongs to the same class as that of the navigator who attempted to propel his craft by placing a bellows at its stern to artificially fill the sails with wind.

This device is deficient in utility. Section 31 of the patent act requires that the Commissioner shall issue a patent only when the invention for which a patent is sought is "sufficiently useful and important." The courts have construed the word "useful" so as to include anything that is not hurtful, and *is adapted to the end sought.* In this case there is an entire want of such adaptation. I admit that there is rarely ground for invoking this clause of the statute to defeat an application, and it should always be resorted to with great caution. The mere fact that but little invention is shown, or that the device is small, and apparently trifling, is not proper ground for rejection; but when, as in this case, the universal law of gravitation must be

ignored in one portion and doubled in effect in another in order to make the device operative, the question as to whether it is "sufficiently useful and important" is pertinent.

The device, however, even if it were useful, is not new. The form of pump selected is one well known, even to the pendulum pump-handle. The adaptation of the device for using the same water over and over is shown in almost the identical form on page 176 *Perpetuum Mobile*, by *Dircks*, second series. The device there shown is really a full and complete answer to the application. The only difference is that the reference shows one well-known form of pump, and the application another. The reference, however, is a little further advanced in the art than the application, for it shows mechanism, by means of which the water-wheel is to pump the water by which itself is revolved. There is no good reason why the applicant should not show an equivalent device, even for that purpose, for he proposes, with less than one-man power, to raise water enough to run a water-wheel with sufficient force to operate a quartz-mill of five or more stampers of the largest size. Now, as it requires at least a three-man power to operate a single stamper, applicant might omit one stamper, and use the power required to operate it in vibrating the pendulum pump-handle, when he would have the perpetual motion.

Substantially the same device is shown in the rejected application of R. M. Loffelmire, (class Water-Elevators,) filed July 2, 1855, and in at least a dozen other references that might be cited. I have given these references in addition to those cited by the Examiner, though I deem his references as abundantly sufficient.

The device lacks both novelty and utility; hence the decision of the Board of Examiners-in-Chief must be affirmed.

WILLIAM WARD.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Wm. Ward for patent for* IMPROVEMENT IN HOUSES. *Decided October 3, 1873.*]

Inventions are not to be ignored because they relate to the subject of architecture.

There is no reason for excluding patents for inventions from the art of building which will not apply to exclude them from every other art.

In whatever department of art a new and useful invention is produced, a patent for it, duly applied for, cannot lawfully be refused.

LEGGETT, *Commissioner:*

The object of this alleged invention is set forth in the specification to be "the construction of two distinct dwellings upon a single circumscribed lot of ground, with such divisions and subdivisions of its interior space as to give to each dwelling large and roomy apartments where most needed, and affording in each access to both front and rear of the building on every floor, without depriving either dwelling of its equal proportion of front and rear apartments."

The claim is as follows:

"I do not claim the particular style and arrangement of the rooms; but what I do claim is—

"In a double tenement-house on a single circumscribed lot of ground, the broken wall X X X X X, so constructed, substantially as described, as to apportion off the corresponding space in the successive stories to each dwelling alternately, and give to each tenement both front and rear space on each floor, as set forth and shown."

A lot of ground—say, twenty-five feet—intended for two tenements, instead of being divided by floors, or in the center by a partition-wall extending from the ground to the roof, as is the common practice, is divided diagonally by an angular wall, so as to give to the respective tenements alternate wide front and rear rooms on each floor. Two entrance-halls are provided, extending through the building, next the outside walls, leaving the larger rooms in the center, and facing, respectively, front and rear. The stairways are between the large rooms, and lead, respectively, from the lower large back room in one tenement to the upper large front room, and, in the other tenement, from the lower large front to the upper large back room.

The objection made to the grant of a patent is that the case comes within the province of the architect, whose business it is to furnish plans for buildings adapted to the sizes of lots, and to the tastes, wants, or means of builders or tenants; and that a patent is precluded by the decision of the Acting Commissioner in the case of A. M. Smith, OFFICIAL GAZETTE, vol. 2, p. 674. In other words, I take it the objection is that the device exhibits no invention, for if it is an invention it comes within the province of the inventor, and not of the architect, and may be patented if new and useful, whether it appears to be in some sense similar to the business of an architect or not. There is no reason for excluding patents for inventions from the art of architecture which does not apply to exclude them from every other art. If a new dwelling for man is invented it is as much the subject of patent as a bird-cage, a bee-hive, or a dove-cote, all of which have been patented without question.

The following patents indicate somewhat the practice of the Office with reference to inventions of different structures, and show that buildings of all sorts have been the subjects of patents:

J. Harmony, granary, August 20, 1835; R. M. Abbe, hog-pen, August 29, 1854; Ebenezer Ford, granary, October 24, 1854; A. B. Furbee, corn-crib, December 6, 1859; Wm. E. McIntire, stable, September 18, 1860; Patrick Burke, stable, October 9, 1860; S. R. Beckwith, granary, fruit-house, &c., March 13, 1866; J. Knapp and H. S. Elliott, sheep-shed, November 27, 1866; D. Pangle, sheep-house, October 8, 1867; D. S. Whittenhall, dwelling, March 24, 1868; Shelby Reed, sheep-rack, March 23, 1869; Joel Tyler, stock-barn, August 2, 1870.

The claim in the case of A. M. Smith was refused because, in the opinion of the Acting Commissioner, it did not cover an invention, and not because invention is to be forbidden or ignored in connection with the subject of architecture.

In whatever field of art a new and useful invention appears, a patent for it, duly applied for, cannot lawfully be refused.

This case appears to me to clearly exhibit an invention. I have no idea that an architect, as such, would ever hit upon such a plan of building a house. If called upon to produce a plan for two tenement-houses upon a small lot of ground, a mere architect will uniformly follow one or the other of the well-known methods of division. He will either make a straight partition-wall in the center between the two tenements, or else he will separate them by floors. Within these two plans he will present a great variety of subdivisions; but it never occurs to him that he can radically depart from them, or conveniently and advantageously combine the two. Therefore this device is not merely within the province of an architect to produce.

The decision of the Board, which, it is due to them to say, was merely *pro forma*, is reversed, and the application will be allowed.

CHARLES W. JENKINS.—*Appeal.*

[*Appeal from the Board of Examiners-in-Chief in the matter of the application of Charles W. Jenkins for patent for* IMPROVEMENT IN SKATES.—*Decided October 2, 1873.*]

ABANDONMENT.—PUBLIC USE.

A public use of an invention must always be distinguished from a merely experimental one, and any use which, viewed with liberality, can be reasonably regarded as experimental, should be so held.

But a public use, once established, need not be shown to be general or extensive.

Where an inventor swore his use of his invention had been experimental, with a view of perfecting and patenting it, although the use had extended through several years, and apparently resulted in no substantial change in the device, and although a patent for the device had been granted to another more than two years before he made his application: *Held*, that these circumstances were not sufficient to rebut the inventor's oath and prove that he had abandoned his invention, in view of the rule that the law does not favor abandonment.

LEGGETT, *Commissioner:*

This application was put in interference with the patent No. 77,862, granted to Barney and Berry, May 12, 1868. Upon the testimony in said interference it was adjudged that Jenkins was the prior inventor, but that he had abandoned his invention, under section 7 of the act of 1839, through its use or sale in public, with his knowledge and consent, more than two years prior to making application for a patent therefor. The question of abandonment under this section of the statute, being an *ex-parte* one, the interference has been dissolved, and Jenkins has brought it up upon appeal. It is merely a question of fact. Was there or was there not a public sale or use of this invention more than two years before July 1, 1870, with his knowledge and consent? A *public use* must always be distinguished from a merely experimental one, and I gather from the decisions of the courts that, in consonance with the spirit the patent law which fosters invention, much latitude of experimental use is allowable—that any use which, when viewed with liberality, can be reasonably regarded as experimental, should be so held.

Judge Clifford recently said: (*Jones* vs. *Sewall*, OFFICIAL GAZETTE, vol. 3, p. 630,) "When a party practices his invention merely for the purposes of experiment or completion, before he takes out a patent, the inference that he intends to surrender the invention to the public does not arise, and consequently a dedication to the public cannot be proved by evidence that shows only experimental practice by the inventor or his employés, whether in public or private. Such an inference is never favored, nor will it generally be sufficient to prove such a defense unless it appears that the use, exercise, or practice of the invention was somewhat extensive and for the purpose of gain, evincing an intent on the part of the inventor to secure the exclusive benefit of his invention without applying for the protection of letters patent."

In all cases in which a use is proven the question constantly recurs whether it was public or experimental. With respect to a sale there is less room for a controversy. But it has been held that if a single actual public use be established in proof which cannot, by liberal allowance, be reasonably considered experimental, it works a forfeiture. It is not essential that *such* a use be shown to be general or extensive in order to work abandonment.

Judge Swayne said, in *Blandy* vs. *Griffith*, 3 Fisher, 609, decided in 1869: "The statute (act of 1839, sec. 7) is inflexible as to the time when the patent is to be applied for, with reference to the prior (public) use and sale of the invention. The neglect to apply within two years after such sale or use is inevitably fatal. Whenever this fact appears the patent falls. Whatever the circumstances, the courts have no dispensing power."

See also *Rich* vs. *Lippincott*, 2 Fisher, 1; *Pitts* vs. *Hall*, 2 Blatchford, 229; *McCormick* vs. *Seymour*, 2 Blatchford, 240.

It is clear that Barney and Berry had obtained their patent, and had publicly used and sold the invention more than two years before Jenkins applied for his patent. But it is not established that this was with the knowledge and consent of Jenkins, however strong the implication may be. I concur with the Examiner of Interferences that Jenkins made the invention in 1862. It is impossible for me to perceive a substantial patentable difference of construction as existing between the skates originally made with a steel spur secured in the toe of the blade, and as now made with a spur which is a projection from the toe of the blade and a part of the blade. The spur is the same thing, and answers the same purpose in either case.

The invention is wholly comprehended in placing a small short spur on the toe of a skate-blade in any suitable manner, so as to catch into the ice when the skater desires to execute what are called toe movements. If Jenkins has been diligently experimenting, as alleged, for eight years upon this little spur, (which seems almost incredible,) he has practically come out where he started, having made no more than a colorable variation.

"Exhibit E, Cole," which Ward, testifying for Jenkins, swears he made in 1864, is unquestionably the same invention exhibited by the model Jenkins has filed with his application for patent. The two are as nearly identical as could well be.

Had the spur placed upon the skates in 1862, or that shown by "Exhibit E," made in 1864, and used by Jenkins in skating afterward, been known to be in existence, the patent of Barney and Berry would certainly never have been granted. It may be considered, then, whether skate-blades with spurs of any sort upon their toes were in public use or on sale, with the knowledge and consent of Jenkins, more than two years before he applied for his patent.

Upon a careful examination of the entire evidence, I do not find that they were. He swears his own use was experimental, and there is nothing but his delay, and

the seeming improbability of so much experiment upon such a device with such meager results, to rebut his oath. That cannot be regarded as sufficient, in view of the rule that when a man is clearly shown to be the first inventor the law does not favor the idea that he will voluntarily abandon his invention. He also swears that it was ever his intention to obtain a patent, and he is, to some extent, corroborated.

Abandonment is not proved, and the decision of the Board is therefore reversed, and the patent will issue.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,260.—Defecating and Clarifying Cane-Juice.—Granted to EDWARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 3, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

25,236.—Cut-Off Valves of Steam-Engines.—Granted to EDWARD R. ARNOLD, November 1, 1859. Application filed August 1, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

25,978.—Tackle-Blocks.—Granted to ISAAC E. PALMER, November 1, 1859; reissued September 8, 1863, April 11, 1865, and December 6, 1866. Application filed July 26, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,064.—Bit-Stocks.—Granted to NELSON STOFFORD, November 1, 1859; reissued April 23, 1867. Application filed July 26, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,068.—Telegraphic Machines.—Granted to GEORGE M. PHELPS, November 1, 1859. Application filed July 30, 1873. Testimony closes September 30, 1873. Hearing October 15, 1873.

26,088.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,089.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,099.—Machines for Making Box-Joints.—Granted to JAMES SIMPSON, November 8, 1859. Application filed August 2, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,099.—Sleeping-Cars.—Granted to JOHN DANNER, November 8, 1859. Application filed August 4, 1873. Testimony closes October 7, 1873. Hearing October 22, 1873.

26,097.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,099.—Machines for Folding Paper.—Granted to CYRUS CHAMBERS, JR., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,097.—Electro-Magnetic Telegraphs.—Granted to MOSES G. FARMER, November 15, 1859; and reissued December 10, 1872. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,120.—Billiard-Table Cushions.—Granted to GEORGE D. SHARP, November 15, 1859; and reissued April 8, 1873. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,125.—Portable Pumps.—Granted to WILLIAM T. VAIL, November 15, 1859; reissued February 26, 1861. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,126.—Mode of Advertising.—Granted to EDWARD WIRE, November 15, 1859. Application filed August 18, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,139.—Pumps.—Granted to WILLIAM WISSEY, November 15, 1859. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,147.—Machine for Bundling Kindling-Wood.—Granted to WILLIAM L. WILLIAMS, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,177.—Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 16, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,178.—Making Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 16, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,202.—Manufacture of Paper-Pulp.—Granted to JOHN B. PALMER and GARDINER HOWLAND, November 22, 1859; and reissued July 2, 1867. Application filed August 20, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,242.—Water-Closet Basins.—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 16, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,244.—Machines for Registering Music.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 20, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,262.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. FERRY, November 29, 1859. Application filed August 30, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,291.—Molding for Metal Casting.—Granted to JOHN P. BROADMEADOW, November 29, 1859. Application filed August 15, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,327.—Nursing-Bottles.—Granted to FRANCIS J. LA FORME, November 29, 1859, and reissued January 14, 1868. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,329.—Boot and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 22, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,339.—Water-Wheels.—Granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1866, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 12, 1873.

26,401.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 22, 1869. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,408.—Composition for Kindling Fire.—Granted to ELIZABETH BELLINGER, December 13, 1859, and reissued August 7, 1866. Application filed September 15, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,410.—Seed-Planters.—Granted to WILLIAM BLESSING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,454.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, JR., December 13, 1859, and reissued April 3, 1860. Application filed September 13, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,475.—Breech-Loading Fire-Arms.—Granted to ESTHER BURTON, December 20, 1859, and reissued December 31, 1860. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,486.—Pipe-Molding.—Granted to JOHN FERTH and JOHN INGHAM, December 20, 1859, and reissued April 26, 1863. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,487.—Screw-Taps.—Granted to WILLIAM and ROBERT FOSTER, December 20, 1859. Application filed September 18, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Trap.—Granted to JAMES A. LOWE, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,513.—Nail-Plate Feeder.—Granted to JOHN NEWELL, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL L. KIMBALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,582.—Harvesters.—Granted to JOHN GOSS, December 27, 1859, and reissued January 13, 1861. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to JONATHAN P. GROSVENOR, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,592.—Horse Hay-Rakes.—Granted to SAMUEL LYMAN, December 27, 1859. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Fervor Ware.—Granted to BRADFORD S. PIERCE and MARCH R. PIERCE, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to BENJAMIN F. STURTEVANT, December 27, 1859. Application filed September 25, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,674.—Clothes-Driers.—Granted to B. B. HAWES, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to FRANCIS C. LOWTHROP, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,805.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 19, 1869. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,832.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 30, 1873. Hearing January 7, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOFT, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

27,539.—Manufacture of Gun-Barrels.—Granted to JAMES H. BURTON, March 20, 1860, and antedated to September 20, 1859; reissued December 26, 1871. Application filed July 1, 1873. Hearing September 16, 1873.

EXTENSIONS GRANTED.

25,640.—Improved Steam-Boiler, granted to JOSEPH HARRISON, JR., October 4, 1859.

Claim.—1. The construction of a boiler of distinct globular or spherical parts, single or in groups, substantially as above described, united in the manner hereinbefore specified, or any other analogous thereto, and wherein the strength of the globular form of such parts is common to the entire structure.

2. The employment, as units of construction, as hereinbefore explained, of separate chambers, of cast-iron or other metal, of uniform size or shape, substantially as described, to be used as wanted, wherewith boilers of different forms and dimensions may be built up, being united together in the manner hereinbefore specified, or any other analogous thereto.

25,662.—Improvement in Construction of Prisons, granted to EDWIN MAY, October 4, 1859.

Claim.—1. The angle-door D, in combination with the safe-lock or bolt I, when constructed and operated substantially as set forth.

2. The safe J, containing the drum p and bolt I, and being held by the outer door C, when constructed and operated substantially as and for the purpose set forth.

3. The endless chain or rope s, in combination with the levers d, when constructed and operated substantially as and for the purposes set forth.

4. The combination and arrangement of the levers b, bar c, and bolts or lugs p, when operated from without the grating i, substantially as and for the purposes set forth.

25,673.—Improved Machine for Lasting Boots and Shoes, granted to JAMES PUSHETON, JR., October 4, 1859; reissued January 6, 1863, numbered 1,362.

Claim.—1. Compressing the upper around the last by means of clamps provided with projecting plates or flanges to turn the projecting edges of the upper over upon the insole or last in any manner, substantially as described.

2. In combination with any suitable device for holding and supporting the last, the use of a series of clamps moved inward simultaneously by levers, or their mechanical equivalents, to compress the upper upon the last equally on all sides, substantially as hereinbefore explained.

3. The hinged or folding plate C, employed in connection with the clamps A, substantially in the manner described.

4. The cutting or roughening plate E, constructed and operating substantially as and for the purposes set forth.

Disclaimer filed September 27, 1873.

Disclaims as follows: "The parts may be arranged to impart motion to the said plates or flanges, either simultaneously with the motion of the lower part A of the clamps, or at any desired period in relation thereto. If moved simultaneously, the said plates or flanges may be permanently attached to, or form parts of, the clamps projecting inwardly to the required distance from the inner surfaces of the lower portion A."

25,683.—Improvement in Hydrants, granted to CHARLES L. STACY, October 4, 1859; reissued June 6, 1865, numbered 1,905.

Claim.—The provision, in a hydrant-piston, of a flexible cup, G, or its described equivalent, as arranged as to cover the water-aperture in the act of drawing, and to be pressed against said aperture by the head of the water in the discharge-pipe, substantially as set forth.

2. The relative arrangement of the cup-formed disks F, G, and G'', and the apertures K and L, adapted, in the manner set forth, to form a chamber, I, closed on all sides, with the exception of the ingress-aperture K, while the hydrant is open, substantially as set forth.

25,692.—Improvement in Sewing-Machines, granted to KASMIR VOGEL, October 4, 1859; reissued November 1, 1864, numbered 1,805.

Claim.—1. In combination with the needle which carries the thread through the cloth, combined with suitable means below for concatenating the stitches to form a seam within the edge, or what is to be the edge, the employment of the thread-conductor, or the equivalent thereof, for uniting the thread, which passes over the edge to make the edge-finish, with the seam within the edge, substantially as described, and for the purpose set forth.

2. The employment of a guide or guides for introducing and laying a thread or cord, turned a bur, on one or both surfaces of the material, parallel with the seam and under the concatenating thread or threads, substantially as described, in combination with the sewing mechanism, or the equivalent thereof, and the mech-

anism, or the equivalent thereof, for passing the thread or threads over and across said bar or bars, substantially as described.

96,701.—Improvements in Skeleton Skirts, granted to JAMES DRAPER, October 4, 1859; reissued December 27, 1859, numbered 870; and again reissued August 1, 1865, numbered 2,046. (GEORGE A. DRAPER, administrator.)

Claim.—The (new) manufacture of skeleton skirts, substantially such as described, consisting of a series of tapes woven in the direction of their length, in alternate sections, as single and as double tapes, with the hoops inserted in the loops formed by weaving the tapes in double tapes, and there secured, to prevent the tapes from sliding laterally on the hoops.

DISCLAIMERS FILED.

25,666.—Machine for Lasting Boots and Shoes.—Granted to JAMES PURRINGTON, Jr., October 4, 1859; reissued January 6, 1863, numbered 1,303. Disclaimer filed September 27, 1873.

Disclaims:

That part of the reissued specification which relates to a permanent attachment of the plates or flanges to the clamps, and which is contained in the following words, viz: "The parts may be arranged to impart motion to the said plates or flanges, either simultaneously with the motion of the lower part A of the clamps, or at any desired period in relation thereto. If moved simultaneously, the said plates or flanges may be permanently attached to or form parts of the clamps projecting inwardly to the required distance from the inner surfaces of the lower portion A."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date September 30, 1873.]

6,285.—Gall-Bolts.—CHARLES S. BARNARD and EDWARD A. BARNARD, West Meriden, Conn. Application filed September 5, 1873. Term of patent 14 years.

6,286.—Boot-Jacks.—OTTO F. FOGELSTRAND, Kensington, Conn., assignor to HART, BLIVEN & MEAD MANUFACTURING COMPANY, same place. Application filed June 30, 1873. Term of patent 7 years.

6,287.—Lamp-Shades.—WILLIAM MARVERS, New York, N. Y. Application filed June 14, 1873. Term of patent 14 years.

6,288.—Tea and Coffee Pot Base.—EDWARD B. MANNING, Middletown, Conn. Application filed July 17, 1873. Term of patent 7 years.

6,289.—Lamp-Feet.—NATHANIEL L. BRADLEY, West Meriden, Conn., assignor to BRADLEY & HUBBARD, same place.—B. Application filed September 16, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date September 30, 1873.]

1,472.—Windmill.—ATWOOD & BODWELL, San Francisco, Cal. Application filed August 16, 1873.

"'Excelsior Windmill.'"

1,474.—Packed Oysters and Fruits.—BARNES, ADAMS & Co., Baltimore, Md. Application filed September 24, 1873.

"'Capitol brand,' with engraving of Capitol of the United States."

1,475.—Fertilizer.—GEORGE DUGDALE & Co., Baltimore, Md. Application filed August 21, 1873.

"'Early Ripener Soluble Phosphate!'"

1,476.—Fertilizer.—GEORGE DUGDALE & Co., Baltimore, Md. Application filed August 21, 1873.

"'Upland Cotton-Fertilizer,' the word 'Upland' having the figure of an arrow drawn through it lengthwise."

1,477.—Fever and Ague Cure.—HARMAN VAN RIPER and JAMES G. BEACH, New York, N. Y. Application filed September 13, 1873.

"the figure of an Indian having a bag containing the cure tied across the bare stomach."

1,478.—Prepared and Preserved Fish.—DODD, TABR & Co., GLOUCESTER, Mass. Application filed September 24, 1873.

"A star, the outline of which is composed of broken lines."

1,479.—Brandies.—MICHAEL DOHERTY & COMPANY, Boston, Mass. Application filed September 22, 1873.

"'Imperial Cognac,' with crown and one or more stars."

1,480.—Cheese.—WEBB, TURNER & Co., New York, N. Y. Application filed September 20, 1873.

"'Gilt Edge.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date September 30, 1873.]

ORIGINAL PATENTS.

143,216.—Oil-Cup.—ALEXANDER T. BALLANTINE, Titusville, Pa. Application filed May 31, 1873.

A filling-cup is connected with the oil-reservoir beneath by a neck, having a two-way cock to open and close successively a passage for the oil down and one for the steam up. The oil-reservoir is surrounded by a shell, and between the two is a narrow space for steam, which softens the lubricant. Below this is a neck connecting the reservoir with the steam-chest, and having two passages, one conveying oil into the steam-chest, the other a passage for steam from the steam-chest into the narrow space between the oil-reservoir and its shell. This neck is also supplied with a two-way cock, and when the upper cock closes both passages steam may be admitted by turning slightly the lower cock, and by further turning it the lubricant will enter the steam-chest. After this the lower cock is turned off, and the steam is allowed to escape through a passage in the upper neck and a pipe extending above the filling-cup. By turning the upper cock, and by further turning it, the reservoir is replenished by oil from the filling-cup.

Claim.—1. In an oil-cup or lubricator, a steam-discharge tube, P, arranged in relation to the filling-cup, substantially as and for the purpose specified.

2. In an oil-cup or lubricator, the combination of the filling-cup F, steam and oil passages Q R, and two-way cock S, and the discharge-tube P, substantially as and for the purpose specified.

3. The steam-space C, oil-reservoir A, oil and steam passages H L, and two-way cock K, in combination with the steam and oil passages Q R, two-way cock S, and filling-cup F, with the discharge-tube P, substantially as and for the purpose specified.

143,217.—Wood-Screw.—OLIVER D. BARRETT, Washington, D. C. Application filed September 5, 1873.

Claim.—The wood screw A with the drill-point *b*, as set forth.

143,218.—Loom-Picker.—SAMUEL BOORN, Lowell, Mass. Application filed April 9, 1873.

To prevent the picker from breaking near the guide-rod, it has applied to it the jacket, and the ends of the jacket project against the side of the shuttle-box and assist in preventing angular deviation and fracture.

Claim.—The picker A, having its spindle sleeve surrounded by the jacket F, so that the ends of said jacket shall bear against the sides *x x* of the shuttle-box case, substantially as described.

143,219.—Separator for Coal, Ores, &c.—HEZEKIAH BRADFORD, Reading, Pa. Application filed February 1, 1873.

The jig-box, cast in one piece with a perforated bottom, is suspended by means of springs, which balance the weight of the box and contents and plays up and down in a fixed casing, whereby a uniform action of the water upon the material is obtained. The particles of greater specific gravity pass through the sieve and fall upon the incline beneath, which conducts them to the elevator which removes them from the tank. The lighter material, which is separated from the heavier, passes over the edge of the jig and falls upon the perforated inclined apron, from whence it is removed by means of the reciprocating rake.

Claim.—1. A delivery-incline, F, and rake *n*, combined with the jig, substantially as set forth.

2. A perforated delivery-incline and rake or elevating mechanism, in combination with the said jig and a water-supply acting to wash the material as delivered, substantially as set forth.

3. Elevating-buckets passing around pulleys in the tank *m'*, in combination with the jig, and an incline to direct the material that is separated into the path of the buckets, substantially as set forth.

4. A jig, with a perforated bottom and valves to which a reciprocating motion is communicated, of a length proportionate or about corresponding to the diameter of the pieces of material operated upon, substantially as set forth.

5. A reciprocating jig with perforated bottom and valves, in combination with a stationary box to confine the water below the jig-box, substantially as and for the purposes set forth.

6. The reciprocating jig-box and its connections cast in one piece, and provided with supports for the removable perforated bottom, substantially as and for the purpose set forth.

7. The method herein described of regulating the discharge of the material from the jig by varying the height of the water above the place of delivery, as set forth.

8. The method herein specified of separating articles of different specific gravity by screening or assorting the same in size previous to the jigging operation in water, in which the movement is proportionate to the size of the material operated upon, substantially as set forth.

143,220.—Clothes-Wringer.—H. JEROME BURR, Bloomfield, assignor to himself and WM. E. SIMONDS, Hartford, Conn. Application filed July 31, 1873.

The rollers are propelled by gearing that admits of their being separated some distance apart without being ungeared. The clamps are adjusted by screws through pillar-sockets. The upper roller is adjusted by springs and screws bearing on circular plates in grooved slots in the frame.

Claim.—1. The combination of the two larger gears with the smaller pinion, the axles of the former being connected with the axle of the latter by arms (or plate) turning upon said axles, substantially as described, and for the purpose set forth.

2. The combination of the wringer-frame *a*, the pivoted clamps *i*, the thumb-screws *h*, and the pillar-sockets I, constructed, arranged, and operated substantially as described, for the purpose set forth.

3. The combination and arrangement of the screw *r*, the crosser *p*, the circular plates *n*, the springs *o*, and the bars *m* with the axle-ends of the upper wringer-rolls.

143,221.—Wood-Turning Lathe.—JAMES CHASE, Rochester, N. Y. Application filed December 30, 1872.

A revolving pattern-knife is arranged to travel lengthwise of the lathe and act in connection with a smoothing-cutter, the movement of which is regulated by a gage-bar.

Claim.—1. A wood-turning lathe embracing in its construction the main sliding tool-rest B and secondary tool-rest J, the latter having a rotary pattern-knife arranged to be automatically attached to or detached from said main tool-rest, substantially as and for the purposes set forth.

2. A rotary pattern-knife, I, arranged upon the carriage or tool-rest J, and automatically adjusted toward or from the work, as the carriage moves along, by means of the guide *f h*, substantially as set forth.

3. The hollow rotary knife-head L, for permitting the free discharge of the chips therefrom, and for convenience in sharpening the knife, which can be done without removing the latter from the stock.

4. A rotary knife-head, L, in combination with the sleeve N and slide K, operating substantially as described.

5. The conical ring *g* and nut *o*, in combination with the circular knife I and head L, for the purposes set forth.

6. In combination with the main tool-rest B and secondary rest or rests J J', the dog *p* and fixed cam or cams *e* and *e'*, operating substantially as described.

7. The slide *c'* and step *d'*, in combination with the smoothing-tool stock B', for the purposes set forth.

8. In combination with the adjustable rotary head or heads I or I', the rack or racks *j j*, pivoted at one end to the frame, and allowed to follow any undulations of the knife-head, substantially as set forth.

143,222.—Apparatus for Loading and Unloading Wagons.—BENJAMIN COKLY, Washington, D. C. Application filed August 11, 1873.

The truck is lowered to be filled, and then raised to a level with and run into the box to be emptied.

Claim.—1. The combination of the platform A, bed B, supports B', lever C', and connecting-bar C, substantially as and for the purpose described.

2. The combination of the lever C' and adjusting device E *e* E' *g*, or its equivalent, with the bed B and uprights B' of a loading device, substantially as shown, and for the purpose specified.

143,223.—Bale-Tie.—FREDERIC COOK, New Orleans, La. Application filed September 13, 1873.

The curled fastener is riveted to one end of the band. A hook formed on the other end of the band is secured to one end of the fastener, and locked under the other end of the same.

Claim.—1. A cotton-bale tie, made of band metal curled around one end of the band and riveted thereto, and standing off from the band far enough to admit, between itself and the band, the other or bent end of the band, substantially as described.

2. In combination with a bale-band, the curled fastener E, secured to operate substantially in the manner and for the purpose set forth.

143,224.—Grate-Bar.—ALPHONSO F. CROWELL, Hyannis, Mass., assignor to GEORGE H. CLARKE, Brooklyn, N. Y. Application filed September 9, 1873.

Hook-lugs are cast on both sides of the bar, those on one side being turned up and on the other down, so that each bar engages with the one next to it and prevents lateral displacement. Stop-lugs at each end of the bars prevent longitudinal displacement.

Claim.—In combination with the bar A, the hooks *a* and *a'* upon opposite sides of the bar, and the stop-lugs *b*, constructed, arranged, and operated substantially as described.

143,225.—Washing-Machine.—LEVIS H. DAVIS, West Chester, Pa. Application filed August 9, 1873.

In the bottom of a wash-tub is secured a standard. On this revolves a carrier having a projection in the center, and ribs and openings. Above this is an agitator having triangular-shaped beaters with inclined surfaces, and operated by a shaft and gearing attached to the cover of the tub.

Claim.—1. The carrier C, having socket *g*, and loosely pivoted upon the standard B, in the manner and for the purposes specified.

2. The triangular-shaped beaters D, having inclined surfaces, as described, and secured upon the agitator E, substantially as described, for the purposes specified.

3. The agitator E, having the beaters D, formed with inclined sides and rounded corners, in combination with the cap *m*, shaft E', pinion F, gear-wheel G, and the carrier C, all arranged and operating substantially as and for the purpose specified.

143,226.—Machine for Forming Spring-Keys.—MICHAEL DERRING, Syracuse, N. Y., assignor to SWEET, HAMMS & Co., same place. Application filed May 24, 1873.

A reciprocating slide carrying a holder, in which is fitted a vertical mandrel, the end of which is reduced to the inner dimension of the eye. The cutter *c* severs the blank fed in in front of the mandrel. The mandrel carries the blank forward between the rollers *g g* that give the first bend. At this point a spring-catch, *g'*, depressed by the mandrel, rises between the ends of the blank and keeps them apart while the mandrel enters the notches in the rollers *i i*, turning them as it advances and crimping the blank to form the eye, the ends being drawn through and formed by grooves in the rollers. The key is released by cleats *r*, the mandrel being withdrawn by an incline, *s*, up which an arm projecting from the mandrel rides.

Claim.—1. The combination, as herein described and shown, of the notched rollers *i i* and the mandrel *p* and the springs *g' g'*, the rollers being moved in one direction by the mandrel *p*, and in the opposite direction by the springs *g' g'*, as and for the purposes herein set forth.

2. The combination of the spring-holder *g'* and rollers *i i*, for forming the crimp in the eye of the key.

3. The combination of the stud-rollers *g*, spring-holder *g'*, and forming-rollers *i i*, as and for the purposes specified.

143,227.—Machine for Painting Wire-Cloth.—JOSIAH H. DE WITT, Orange, N. J. Application filed March 31, 1873.

Paint is transferred from a roller to a porous belt, and from it to another roller covered with some porous material, and the cloth that passes between the belt and roller is carried through a drying-chamber over an endless belt, having cross-bars provided with pins to carry the belt along and to keep the paint on the cloth from abrasion against the cross-bars. The cloth is formed into a roll at the end of the drying-chamber.

Claim.—1. The painting-machine, constructed and operated substantially as described, with the belt or belts L and rolls B, C, D, and E, or their equivalents, to distribute paint to the wire-cloth.

2. The drying-machine, constructed with endless chains or belts and cross-bars with pins, and operated within a heated chamber, K, substantially as described.

3. The combination and arrangement of the drying-machine, constructed with endless chains or belts, and cross-bars with pins, and operated within a heated chamber, K, with a painting-machine for painting wire-cloth in a continuous web.

143,228.—Printer's Galley-Rest.—JOHN A. DOYLE and JOHN A. MURPHY, Lancaster, Pa. Application filed August 25, 1873.

The bracket is held in different positions by the lug falling into the notches on the hinge.

Claim.—The bracket, with its arm A, brace B, and pins D E, and conic lugs *b*, in combination with the perforated bearing I K N, all substantially as and for the purpose specified.

143,229.—Pipe-Coupling.—WILLIAM B. DUNNING, Geneva, N. Y. Application filed August 26, 1873.

A screw-coupling ring, working upon two flanged conical collars, draws them together upon inclined surfaces of a longitudinally-divided sleeve, compressing it firmly upon a tubular packing, making a tight joint between the two sections of pipe.

Claim.—A pipe-coupling or union embracing in its organization a tubular packing, *k*, conical sleeve *a*, collars *b* and *d*, and coupling-ring A, operating conjointly substantially in the manner and for the purposes set forth.

143,230.—Programme-Clock.—SAMUEL F. ESTELL, Chicago, Ill. Application filed May 10, 1873.

The adjustable pattern-wheel for determining the striking intervals is placed in the lower part of the clock-case, beneath the time movement, from which it receives motion by a long connecting-shaft. A tripping-lever on the pattern-wheel and an attached rod or wire connect the same with the ordinary striking-train.

Claim.—In combination with a programme-wheel, the lever C and drop-wire *a*, operating substantially in the manner described, and for the purpose set forth.

143,231.—Car-Coupling.—MOSES FERREE, Freedom, N. H. Application filed April 11, 1873.

The wedge-shaped furcations on one end of the link, acting upon the studs of the yoke, raise and sustain it, and with it the coupling-pin, until the link has passed far enough in the draw-head to bring its slot beneath the pin, and then, on account of the peculiar shape of the link, the studs are relieved and the pin falls. Should the pin break, the studs on the yoke will engage with shoulders on the link and sustain the draft.

Claim.—1. The draw-bar provided with the yoke B, link-pin C, and studs *c c*, and the link having the slot *g*, the wedged prongs *p*, and the inclined planes *h*, all arranged substantially in manner and to operate as specified.

2. The combination of the yoke B, having studs *c c*, with the link D, having shoulders *k k*, as described, and for the purpose set forth.

143,230.—Planing-Machine.—ANDREW H. FRANK and GEORGE SPIER, Buffalo, N. Y. Application filed June 14, 1873.

Claim.—The pulley G, composed of the pulley proper *g* and one or more concentric cylinders, *g'*, capable of being readily secured thereto and detached therefrom by means of the fastening-pin *i* and cavity *j*, substantially as and for the purpose hereinbefore set forth.

143,233.—Wheel for Vehicles.—JACOB C. GARRETSON, Marshland, N. Y. Application filed August 23, 1873.

Claim.—A spoke and felly fastening, consisting of socket A, base C, and flanges K and L having beveled edges *m* and *n*, bolts F and G with nuts I and J, in combination with the spoke B, felloe D and B, and tire H having flanges, substantially as and for the purpose hereinbefore set forth.

143,234.—Combined Door Hinge and Spring.—WILLIAM GILFILLAN, Syracuse, N. Y. Application filed March 3, 1873.

The hinge swings open in both directions, and has connected with it, so as to operate both ways, a spring-arm. The arm is drawn constantly downward by a coil-spring, and is prevented by a stop-joint from falling within the door-frame when it is disconnected from the hinge.

Claim.—1. In the above-described spring-hinge, the combination and arrangement of the bars *i i'* and plates *a* and *c*, specifically as and for the purposes set forth.

2. The arm *f* connected to the plate *c* of the hinge by a rule or stop joint, as and for the purposes described.

3. The bar *m* in combination with the spring and double-acting hinge, substantially as specified.

143,235.—Cam-Movement.—JOHN E. GOODWIN, Brewerton, N. Y. Application filed February 10, 1873.

Claim.—1. The cam-groove walls placed out of the plane of each other, and their combination with double friction-rolls working on the same arbor or stud, substantially as and for the purpose set forth.

2. The combination of the cam-groove walls placed out of the plane of each other and double friction-rolls working on the same arbor or stud with the mechanical means of relatively adjusting the said walls and rolls in such relation to each other that the lost motion may be taken up, substantially as and for the purpose set forth.

143,236.—Sash and Door Clamp.—ROBERT L. GREENLEE, Chicago, Ill. Application filed November 16, 1872.

Sash, doors, and blinds are clamped in both directions. The clamps are movable upon a stationary frame.

Claim.—1. The combination, in a sash and door clamping machine, of two or more clamps, *c L*, constructed with clamping-lever N and rack M mounted upon a bar, E, adjustable along the bearers A B, and entirely detached from the said bearers or their supports.

2. The combination of the clamps *c L*, draw-rod R, lever N, pivoted rack M, and counter-weight W with the bar E and an adjustable longitudinal clamp, I J K, as set forth.

143,237.—Boot and Shoe Channeling-Machine.—BENJAMIN H. HADLEY, Brooklyn, N. Y. Application filed August 21, 1873.

The groove-cutter and the feed mechanism are attached to a vertically-movable head. The feed mechanism consists of two feed-dogs, loosely pivoted, having their bearing ends serrated, which press down upon and take hold of the stock alternately, giving it a continuous forward motion. The stock is supported upon a revolving convex-faced table, which rotates at a speed corresponding to the feed movement.

Claim.—1. The herein-described feed mechanism consisting of feed-dogs arranged to move above and in contact with the work, and having a compound vibratory or walking movement, so that each, alternately and in succession, will take hold of and carry along the sole, the one taking hold of the work just as the other is about to leave it, substantially as herein shown and set forth.

2. In combination with the feed mechanism, the cutter mounted upon a vibratory arm in the manner substantially as herein shown and described, so as to cut into the sole, forming the inside channel at the proper angle with respect to the sole, and that it may be withdrawn therefrom, substantially as and for the purpose set forth.

3. The combination of the feed-dogs, moving on a fixed gudgeon passing through slots in their upper ends, with the crank-shaft for operating said dogs, substantially as shown and described.

4. The divided crank-shaft carrying the feed-dogs and mounted at one end in the vertically-movable head, and at the other end in a rocking bearing on the main frame, under the arrangement and for operation as shown and set forth.

5. In a boot and shoe sole channeling-machine, the combination, with a top feed mechanism, of a revolving circular convex-faced table or support for the work, placed at an inclination to the horizontal, with its upwardly-tilted part located under the feed mechanism, and moving at the same rate of speed at which the work is fed along, substantially as shown and described.

6. The cutting and feed mechanisms, arranged on and carried by a vertically-movable head held down toward the table or support for the work with a yielding pressure, and adapted to elevate said mechanisms entirely from the work, or to adjust them bodily and together at different distances therefrom, substantially as and for the purposes shown and described.

7. The combination of the vertically-movable head with the vibratory arm carrying the inside-slanting channel-knife and pivoted to the head, substantially as shown and set forth.

8. The vertically-movable head carrying the outside grooving-cutter and feed mechanism, and the vibratory slanting knife-carrying arm pivoted to said head, as described, the two being provided with recoil springs, and connected together by means substantially such as specified, in combination with a single lifting-lever arranged to operate in connection with said parts, in the manner shown and set forth.

143,238.—Carpet-Fastener.—CHARLES HARTING, Washington, D. C. Application filed February 21, 1873.

A round nail has a projection on the head and an angular offset near the lower end; a tube for insertion into the floor, the tube having a groove on the inside, into which the offset of the nail passes in under the tube, which holds it in place.

Claim.—The combination of the nail A, having projections B and E, with the tube D and slot C, as herein described, and for the purposes set forth.

143,239.—Earth-Closet.—CLARK C. HASKINS, New Albany, Ind., assignor of one-half of his right to JAMES FERRIER, Louisville, Ky. Application filed April 28, 1873.

An air box or blower is placed on the under side of the shelf immediately under the drawer. The box is provided with a piston that is operated by means of an arm arranged on the under side of the hopper-slide, the arm being connected with the end of the piston-rod. As the drawer is drawn out a sufficiently strong blast is produced to scatter the dust over all parts of the vessel.

Claim.—The air box or blower E, as above described, when used for earth-closets, in combination with the drawer C, arm F, and slide-arms D D, by means of which it is operated, when arranged, constructed, and operated substantially as and for the purpose hereinbefore set forth.

143,240.—Composition for Preventing Incrustations in Steam-Boilers.—ROBERT HATFULL, Deptford, England, assignor to DAVID L. EVANS, New York, N. Y. Application filed August 1, 1873.

Composed of lac-sulphur, carbonate of potash, animal charcoal, and terra-japonica, mixed with water.

Claim.—A composition formed of the within-mentioned ingredients, in about the proportions specified, for the purposes set forth.

143,241.—Dinner-Bucket.—FRED E. HELLIG, Louisville, Ky. Application filed July 17, 1873.

The pail is made in the form of a cylinder, the top portion of which is divided into two parts, one of which is removable from the other, and has a back attached to it so as to form a water-tight vessel; said detachable portion is hinged to the other part and is provided with a nozzle. The lower portion of the pail is cylindrical also, and is secured to the upper portion by a flange on its upper edge engaging with a flange continuous on the lower edge of the two upper parts.

Claim.—The three-part bucket herein described, constructed with a hinged removable liquid-receptacle, A, and provision-apartments C D, the latter, D, being secured to the bottom of parts A C by flanges, as shown and specified.

143,242.—Gear-Cutting Attachment to Lathes.—WILLIAM P. HOPKINS, Lawrence, Mass. Application filed April 24, 1873.

The sleeve H, which contains the gear-supporting mandrel I and carries the index-wheel C, is located in a hub, B, of which an upright arm, *t*, is held by dovetail against the face of a bar, A, and is adjustable as to height in relation thereto by the screw S, and clamped by screw O, the bar A to be inserted in the tool-post.

Claim.—1. The combination of the arbor-box B, the arbor-spindle H, the index-pulley C, and the screw-bolt O, constructed substantially as shown and described, when used in combination with a slotted and grooved bar, A, and a lathe-carriage tool-post or lathe-carriage.

2. The slide-clasp K, when used with the index-pulley C, and the number of holes in each row in the pulley C is indicated on the face of the clasp K opposite the row of the holes the number represents, substantially as set forth.

143,243.—Wood-Compresser.—HENRY A. HOUSE, Bridgeport, Conn.—Case D. Application filed December 6, 1872.

The invention consists in a peculiarly-formed conical tube, through which the bundles of wood are forced before tying.

Claim.—The compressing-chamber A', presenting a taper which is uninterrupted from one end to the other, as herein shown and described.

143,244.—Apparatus for Checking Horses.—JOHN JACKSON, Hartford, Conn., assignor of one-half his right to GEORGE ROHRMAYER, same place. Application filed December 30, 1872.

Upon the rear end of a hand-lever, pivoted to the side of the wagon, is a half-gear meshing into a rim-gear, which is slipped onto the inner side of the hub.

Claim.—The rod *a a'*, pivoted to the vehicle, one end coming up at the front or side of the same, and the other end bearing the half-gear *d*, or its equivalent, meshing into the gear *e*, attached to the hub or wheel, the whole combined and arranged to operate substantially as and for the purpose set forth.

143,245.—Potato-Bug Destroyer.—ALFRED A. MIXER, Hamilton, Ohio, assignor of one-half his right to FRANK BLACK, same place. Application filed August 16, 1873.

A hopper, at whose open side is mounted an adjustable reel, is fixed upon a barrow, from the wheel of which a bevel-gear transmits motion to a pair of crushing-rollers in the bottom of the hopper, and by cord and pulley to the reel. The operator propels the instrument along at the side of the row, the reel brushing the bugs off into the hopper, where the rollers crush them.

Claim.—1. The crushing-rolls F K, in combination with the adjustable reel and hopper J, constructed and arranged as and for the purpose specified.

2. The combination of the frame A, handles B, hopper J, rolls F K, and reel G, with a single driving and carrying wheel, C, substantially as and for the purpose specified.

143,246.—Apparatus for Separating Nails.—ALEXANDER MORRISON, Harrisburg, Pa. Application filed April 2, 1873.

A chute in two parts, adjustable to nails of different sizes, with defending flanges to allow limited oscillations to the nails; an adjustable wicket to arrest the exit of more than one nail at a time; and a supplemental chute directed rearward to conduct imperfect nails to a separate receptacle. It is connected at its upper end to the frame of the nail-cutting machine, and its lower or free end is so connected to the heading-lever as to receive therefrom quick lateral vibrations.

Claim.—1. The frames L A' and L' A', in combination with each other, when joined adjustably above by the binding-screw *d g* in the heads of the standards S S', or their equivalents, and when joined adjustably below by the differential screws *a b* and *a' b'*, or their equivalents, so as to form between them, by their direct union, the defective-nail exit-opening Z, of variable width, in the manner as and for the purpose herein set forth.

2. The conformation of the inner faces of the fenders A' A' farther apart at the bottom than at the top, to allow the nails limited space to dangle while suspended by their heads in the crevice Z, substantially as herein set forth.

3. In the trough of the upper chute, the inclined standards S S', pivoted to each other adjustably by a slot in the head of one of the standards, and a seat in the opposite head for the binding-screw *d g*, in combination with the frames L A' and L' A', to form in said trough, by their union, a variable wicket vertically over the opening Z, substantially as and for the purpose herein set forth.

4. The apparatus herein set forth, composing the upper and the under chutes, in combination with the nail-machine, by means of the strap N and pivoted cross-head W attached to the frame of the nail-machine, and the agitator C attached to the spring-rod B on the nail-machine heading-lever, all operating conjointly, substantially in the manner as and for the purpose herein set forth.

5. The agitator C, attached to the vibrating rod B, in combination with the nail-separating apparatus, when its connection therewith is by simple contact against the under side of the oblique outwardly-projecting plate forming a side of the upper chute, the vertical vibration of the agitator being thus carried by the elasticity of the frames of the apparatus in favor of lateral and vertical agitation, as herein set forth.

6. In a nail-separating apparatus, a forwardly-inclined upper chute for the delivery of the perfect nails, in combination with a rearwardly-inclined under chute for the removal of the imperfect nails, slivers, and dust particles, to favor the collection of the discharged contents of the chutes in separate receivers, as herein set forth.

143,247.—Mode of Fastening the Racks of Dredging-Machine Dipper-Handles.—RALPH R. OSGOOD, Troy, N. Y. Application filed August 28, 1873.

The racks by which the dipper-handle in dredgers of this class is reciprocated are in this case secured to its under face by bolts passing up through and fastened by nuts screwed down upon the upper face of the wearing-plates. The nuts are exposed, to enable portions of the rack to be readily removed in case of breakage; and in order that they may not interfere with the slice or rollers on which the carriage works, said slide or rollers are grooved so as to allow of the passage of the nuts without impediment.

Claim.—The racks G G, secured to the dipper-handle by means of nuts, which are exposed upon plates D D, substantially as and for the purposes described.

143,248.—Walking-Cane.—CHARLES K. PEVEY, Worcester, Mass. Application filed August 18, 1873.

Claim.—The cane, or handle part thereof, provided with the eyeglass C, the projection A, and the head or bow B, all constructed and arranged as specified.

143,249.—Running-Gear for Wagons.—GARDINER PHILLIPS, Augusta, Me. Application filed May 7, 1873.

The reach is bifurcated near its forward part, the rear ends being rigidly secured to the rear crank-axle, while the forward part of the reach is made in such form as to constitute the upper portion of the fifth-wheel.

Claim.—1. The reach F', bifurcated at its rear end, bent upward at its front end, in combination with the rear crank-axle B and front axle A, substantially as and for the purposes specified.

2. The reach F', bent upward at its forward end, and attached, by the bar T and rods U, to the rear axle, by the braces H and eye H', to the king-bolt, and by the segmental plate J and brace N to the bolster, substantially as described.

3. The combination of the segmental plate J', formed on the end of the reach F', and provided with the bent lug J², with the corresponding plate K on the axle A, substantially as and for the purposes specified.

143,250.—Sifter.—DANIEL PIERCE, Washington, D. C., assignor to JOHN W. WILLIS. Application filed March 3, 1873.

The cover is constructed to receive a packing, which renders the device dust-tight.

Claim.—The sifter-case constructed as shown and described, the same consisting of the pan or box B provided with the projections *c* and handles *k k*, the sifter-pan A, extending above the pan, as shown, and the cover E, provided with the inner flange *g*, extending downward within the box, and having the packing-channel A between the flange and rim *f*, the construction being such that the very act of sifting permits the operator to compress the parts together, and also to compact the packing and make the whole dust-tight.

143,251.—Ordnance and Projectile Therefor.—BENJAMIN C. POLE, Washington, D. C. Application filed January 22, 1873.

Claim.—For use in a gun having an axial bore extending entirely through the breach, a projectile, having a tag, *h*, provided with the tapering tip or knob *x y*, for the purposes set forth, the grooves *g g* for positively locking the projectile to its proper position, and the groove *d* to determine the point of rupture, the construction permitting the ready withdrawal of the tag from the rear of the butt, or the use of the gun with any ordinary projectile by leaving the tag unremoved.

143,252.—Apparatus for Preventing Back Motion.—ALFRED H. RACE and JAMES H. RACE, Brooklyn, N. Y. Application filed December 9, 1872.

The disk is made fast to the shaft to be driven, with arms pivoted in it, projecting to the inner periphery of the hollow disk fixed loosely on the hub. The arms project rearward of the radial lines of their pivots and clutch against the rim of the hollow disk when the wheel is turned in the forward direction, and instantaneously release it when turned backward.

Claim.—1. The combination of the loose pulley provided with an internal flange, E, at its periphery, the disk A, fastened rigidly to the shaft C, and the loose pressure-pawls D D D, &c., hinged thereto, all substantially as and for the purposes set forth.

2. In combination with the disk A, provided with the sockets H, constructed as described, three or more pawls, D, which are prevented from falling too far from the rim E by the sides of the notches H, and come into action, when the machinery is driven forward, entirely by their own gravity.

143,253.—Harness-Pad.—WILLIAM A. REDDICK, Niles, Mich. Application filed September 6, 1873.

A hollow harness-pad made flexible and ventilated by slots cut from the pad-plate. The strips formed by this slotting are bent over a metal stay, which is secured to and retained by the leather.

Claim.—The hollow flexible zinc pad B, having the slots D D D, and forming a constituent part of a harness, substantially as and for the purposes hereinbefore set forth.

143,254.—Apparatus for Collecting and Transporting Grain and other Materials.—JOHN RICHARDS and GEORGE RICHARDS, Philadelphia, Pa. Application filed February 25, 1873.

Claim.—1. The pneumatic apparatus for transporting grain, shavings, dust, textile material, or other substances, arranged and operating as described, consisting essentially of a magazine in which a partial vacuum is maintained, a fan or equivalent to generate air-currents, with conducting and air pipes, the whole combined and operating substantially as specified.

2. A magazine or receptacle for the substances being conveyed arranged with chambers and capable of being partially exhausted of air, as hereinbefore described.

3. A magazine constructed with an air-lock and compartments that may alternately be emptied without impairing the air-currents in the feeding-pipes, as shown and described.

143,255.—Piston and Packing.—ALEXANDER K. RIDER, New York, N. Y. Application filed March 20, 1873.

A piston-packing having a rabbet on its working face nearly its entire circumference, the part resting on the bottom of cylinder being solid, while the upper part is in sections, and set out by springs peculiarly arranged.

Claim.—In combination with the packing D D² and spring or springs E, the continuous surface A' in the body A, adapted to lie in steam-tight contact with the lower part of the interior of the inclosing-cylinder, as and for the purposes herein specified.

143,256.—Drawing-Roll.—HORACE T. ROBBINS, Hyde Park, Mass. Application filed June 5, 1873.

The washer is a wire ring, open at one point in its circumference, and applied in a groove in the arbor, and against to rests a shoulder in the loose boss, so that the latter is prevented slipping off the arbor when one end is raised. The ring can contract when the boss is pulled off.

Claim.—The spring-washer A, or its equivalent, in combination with the loose tubular boss *a* and the arbor *d*, substantially in the manner and for the purpose above specified.

143,257.—Loom Picking Mechanism.—LESTER E. ROSE, Providence, R. I., assignor of three-fourths his right to ELISHA C. MOWRY, same place, and JOHN ENOCH and DAVID B. ALLEN, West Liberty, Ohio. Application filed April 21, 1873.

The picking-stick is actuated by a series of torsion-springs wound spirally upon a rock-shaft, and, to regulate the power of the springs, the lever, which carries the stick, is connected to the rock-shaft by means of a ratchet and pawl. The inner end of said lever moves in a slotted vertical bracket, and when raised by a cam, to place the stick in position at the end of the shuttle-box, it is held by a latch-lever, which is withdrawn by another cam when the shuttle is to be picked.

Claim.—1. The ratchet and pawl R, in combination with the springs J J, shaft g g, and lever G, with the supporting-rod H, substantially as and for the purposes specified.

2. The latch-lever C, cam B, and support F, in combination with the lever G, picker-stick K, shaft g g operated by springs J J, the parts arranged as set forth.

3. The cam L, bell-crank lever M, arm G, and ratchet R, in combination with the shaft g g, springs J J, and brace-rod H, constructed substantially as described, for the purpose specified.

143,258.—Device for Cooling Millstones.—J. JACOB ROTH, Philadelphia, Pa. Application filed January 14, 1873.

The exterior of the bushing is provided with air-flues, which set in vertical openings formed around the eye of the stationary stone of a paint-grinding mill.

Claim.—The stone A, bushing B, and the flues a, as and for the purpose shown and described.

143,259.—Ruffler for Sewing-Machines.—CONRAD SCHULLER, New York, N. Y. Application filed July 23, 1873.

The ruffler is sustained on a bracket attached to the head of the machine, and is operated from the vibrating arm of the machine.

Claim.—The bell-crank lever B, pivoted upon the bracket A, and supporting the hinged elastic gathering-toe C and spring b, in combination with the slotted rod D, adjusting-screw F, stop e, and clamp E, all constructed as described, and adapted to the needle arm or slide of a sewing-machine, as set forth.

143,260.—Butter-Worker.—EDMUND E. SCOTT, Beloit, Wis., assignor of two-thirds his right to G. E. SMITH and JESSE WILSON, same place. Application filed June 6, 1873.

An oblong box with knives forming a grate at each end, said grate removable through a slot; a follower-block, moved by a lever, forcing the butter through the grates, whence it falls into receptacles, a hopper above delivering the butter on alternating sides of the reciprocating-block.

Claim.—In a butter-worker, the combination and arrangement of the grates E E, the sliding double-acting frame or chamber B, divided by the follower-block C, and actuated by the vertical lever G, and oscillating arms H, outer frame or shell F, and hopper A, substantially as set forth.

143,261.—Valve Movement for Reciprocating Engines.—HENRY C. SERGEANT, New York, N. Y. Application filed July 10, 1873.

The piston coming in contact with the tappets moves them, and, through the stems, the valve, it passing beyond them before completing its stroke. The stems are provided with heads which pack the apertures in which they move when the valve has completed its stroke in either direction.

Claim.—1. The tappets e and e', arranged as described, in combination with the valve-stems, the valve C, and the piston B, as set forth.

2. The duplex valve-stem, having the heads m n acting alternately as valves to close the openings through which the valve-stems pass, in combination with the valve C, all constructed and arranged substantially as and for the purpose set forth.

3. The valve-stems m n, constructed with heads, as shown and described, and so arranged as to close alternately the openings through which they pass, substantially as set forth.

143,262.—Corn-Planter.—ALBERT F. SMITH, Montrose, Iowa. Application filed May 27, 1873.

On one of the driving-wheels are cams for operating a seed-slide in the hopper, the corn dropping down through tubes into furrows made by cutter-shoes, after which it is covered by wheels. The cutter-shoes have a free movement, and are connected by a cross-bar, to which is connected a bar extending rearwardly between guards which allow a vertical movement to regulate the action of the shoes.

Claim.—The hopper G, slide F, and tubes g', in combination with cutter-shoes I with cross-bar N, guards F, covering-wheels D, and driving-wheels B having markers b and cams c, as shown and described.

143,263.—Plow.—SAMUEL W. SOULE, New York, N. Y. Application filed September 25, 1872.

A secondary mold-board and share pivoted to the beam forward of the main plow, and capable of being turned up out of the way, so that either one or two furrows may be turned at once.

Claim.—A secondary mold-board and share pivoted to the frame to allow of its being raised and lowered, substantially as and for the purposes set forth.

143,264.—Edging-Machine.—EDWARD H. STRAHM, Erie, Pa. Application filed December 30, 1872.

Two or more adjustable saws are arranged in connection with feeding-rolls and guides, so as to carry the lumber straight through the machine.

Claim.—1. As a means for securing a parallel motion in the movable roll of a pair of feed-rolls, a pinion on each end of such roll, meshing each into a curved toothed rack, substantially as set forth.

2. The movable feed-roll H, consisting of a shaft by means of which the roll is moved vertically, and a roller part, a, with its pinion or bend-wheel a' slipped onto the shaft, so as to have a fixed positive rotary motion, independent of the shaft, and at all points of the vertical travel of the shaft, substantially as set forth.

3. The sectional roll P, in combination with pressure-rolls H H', substantially as and for the purposes set forth.

4. In a machine for edging or slitting boards, the combination of a side guide or rail, fixed or adjustable, and a spurred guiding-roller, n, arranged with its axis at an acute angle to the direction of the feed, substantially as and for the purposes described.

5. As a device by which to set an adjustable guide-rail, a series of slots, o', running in the direction of the feed, two or more in number, when connected with each other by an inclined slot or slots, substantially as set forth.

143,265.—Mitering-Machine.—JAMES H. VAN NESS, Charlotte, N. C. Application filed May 31, 1873.

Miter and square joints are cut, and the table, moving on a hinge, admits of bevel-joints in connection with the miter. Clamps, operated together by a screw, hold the work for these operations.

Claim.—1. The table 1, having the square 2 secured to its top, in combination with the two adjustable clamping-blocks 4, moving at right angles to the sides of the square, and suitable devices for operating them, substantially as set forth.

2. The screw, screw-block, connecting-arms, and clamping-blocks, substantially as specified.

143,266.—Balanced Valve for Hydraulic Cranes.—JAMES A. VAUGHN, Cuyahoga Falls, Ohio. Application filed July 31, 1873.

The piston L' N' d', balances L N d, their disks and flanges, as well as the lower edge of the cylinder D, are beveled to admit water gradually. When the piston L N d enters the chamber M to admit water piston K closes the cylinder D to prevent its escape.

Claim.—1. The combination of the long piston K with the pistons L N d N' L' d' and cylinder A, so arranged as to retain the water in the crane after the inlet-port shall have been closed.

2. The beveled edges of the disk L, flange N, and interior of the cylinder D, at b, for the purpose of rendering the effect of opening and closing the valve gradual, and preventing the shock consequent upon a sudden opening.

143,267.—Jack for Holding Shoes.—ALBION K. WASHBURN, Bridgewater, Mass. Application filed May 26, 1873.

Claim.—In a jack for holding boots and shoes, the combination of the block D^1, link D^2, bent lever D^3, and hand-screw E^1 E^2, when the parts are constructed and arranged as described.

143,268.—Twine-Holder.—DAVID WEBBER, Houlton, Me. Application filed March 22, 1873.

A holder for the ball of twine, constructed in two parts, held closed by a hook at its bottom and suspended by a brace from its center rod, on which a ring is attached, and on its lower end a coiled wire through which the twine is passed, to give tension to it and prevent its free unwinding.

Claim.—The receptacle A, hook b, arms B and C, tension worms and rings c, c, and f, eyes d, K, and G G, rod D, ring E, and regulator F, substantially as and for the purpose hereinbefore set forth.

143,269.—Dredging Apparatus.—ERNEST BAHN, Paris, France. Application filed March 3, 1873.

A tubular metallic frame is connected to the sides of a vessel below the water-line by water-tight ball-and-socket joints, so as to have a free motion. The hydrostatic pressure afforded by the difference of level between the point of entry and the water-line causes the water, mixed with sand and other matter, held in suspension, to enter the perforations in the lower portion of the tube, and be discharged in a continuous stream so long as it is constantly removed, which may be done by centrifugal pumps or other means. To prevent clogging, jets of clear water are forced out just below the dredging-tube, through small apertures for that purpose.

Claim.—1. The mode of extracting mud and sand from any depth by means of a dredging-vessel, having two or more apertures in its hull below the water-line, and forming water-drafts by aid of the pipes a a', the ends of which terminate in spherical sockets for the reception of the pipes b b', in connection with pipes c c, also terminating spherically, and the perforated pipe d, the whole forming a metallic frame capable of being raised and lowered, as desired, by aid of the chain and pulleys e e, the sand, gravel, or mud being removed as it arrives, by the pipes a a, by means of centrifugal pumps p p, and thence conducted to a convenient position or deposited in lighters or barges, thence to be conveyed away as may be desired.

2. The mode of disgregating or separating the solid matter by means of jets of forced water, conducted by the elastic tube m n to the pipe f, furnished with jets o o, which at the same time clean the perforated pipe d, and allow the matter to pass, substantially as and for the purposes hereinbefore set forth.

143,270.—Propelling Boats.—ABRAM BEEKMAN, New York, N. Y. Application filed August 4, 1873.

Claim.—The tubular crank-shafts F H F H, arranged to turn independently upon the same pintle G, and each provided with a paddle, B C, in the manner and for the purpose described.

143,271.—Object for Kaleidoscopes.—CHARLES G. BUSH, Boston, Mass., assignor to himself and J. W. HOARD, Providence, R. I. Application filed November 30, 1872.

A small hermetically-sealed glass-bulb contains two or more immiscible liquids of different colors and densities. When placed in the object-box of a kaleidoscope the liquids change their relative positions in the bulb as the instrument is rotated.

Claim.—As a new manufacture for the kaleidoscope object-box, an object consisting of a hollow glass hermetically-sealed vessel and two liquids of different densities and colors placed in such vessel, such liquids being such as will not readily intermix or combine while in use in some respects.

143,272.—Saw-Set.—BENJAMIN S. CASTLE, Johnstown, Ohio. Application filed June 21, 1873.

The clamp E extends across nearly the whole breadth of the bench A, and is forced down upon the saw by the screw H.

Claim.—The clamp E, levers G, screw H, and spring I, combined with the setting-plate, substantially as specified.

143,273.—Machine for Cutting and Threading Pipes, &c.—WILLIAM D. CHASE, Marion, N. J. Application filed June 3, 1873.

Two columns projecting from the face-plate e carry a cross-head in which the die is placed and revolved. At the rear of the hollow gudgeon supporting the sleeve of the face-plate is a pair of stationary clamps, h h', for holding the pipe. For cutting off a pipe, a cutter held in a slide, s', is moved toward the center by a pin, w^2, bearing on a cam-flange, v, on a sleeve, x. A bevel-pinion, g, aring with teeth on the face-plate, communicates motion thereto, and also to a bevel-gear, v', which has one more tooth than the gear e. This gear v' can be made to communicate its motion to the cam by a screw-ring, w, pressing it against the flange.

Claim.—1. The cam-flange v, sleeve x, clamping-nut w, and wheel v', in combination with the face-plate e and cutting-tool s, substantially as and for the purposes set forth.

2. The latch-pins o o and notched columns l l, in combination with the screw-ring p, die-box m', and die n, substantially as and for the purposes set forth.

3. The movable die-box m^2, with a tubular projection, m^3, entering the hollow gudgeon f, in combination with the gripers h h', cross-head m, columns l, and revolving face-plate e, substantially as set forth.

143,274.—Eyelet-Making Machine.—HENRY L. CHURCHILL and JOHN D. ROBINSON, Taunton, Mass. Application filed September 8, 1873.

The cylindrical punch i is of a less diameter than the interior of the die l. The yielding pressure-rod I gives firmness to the bottom or closed end of the eyelet while the punch is operating to cut it out.

Claim.—The die l, having a flaring mouth corresponding in form and size to the bell of the eyelet, in combination with the yielding pressure-rod I and punch i, of a less diameter than the interior of the die, operating substantially in the manner and for the purpose set forth.

143,275.—Machine for Gumming Shoe-Uppers.—PETER E. CLARK, Hartford, Conn. Application filed June 13, 1873.

Claim.—The gore setting and gumming apparatus consisting of the tablet a, gage-plate b, hinge flap c^1, in combination with the sliding plates c^2 c^3, with or without the clamp d, all arranged and operating as shown and described.

143,276.—Earth-Auger.—WILLIAM T. COOLEY, Chicago, Ill., assignor of one-half his right to DARIUS H. WELLS, same place. Application filed March 3, 1873.

The hollow shank of the auger is attached to the handle by two curved arms, for the purpose of more readily discharging any loose particles accidentally included. The vent of the hollow shaft is protected while boring by the auger-block, but when it is desired to raise the auger the shaft is turned back a short distance until the cross-pin F reaches the vertical groove G', when the shaft carrying the point E is depressed to the extent of the groove, thus exposing the vent. The shaft is then turned in the opposite direction, the pin F entering the lower groove G, when the whole can be readily withdrawn without atmospheric resistance.

Claim.—1. The hollow shank B, provided with the vent H, point E, and pin F, in combination with the loose grooved block C, substantially as and for the purposes specified.

2. In an earth-auger, a hollow shank, provided with a vent, arranged below the cutters, and having its upper end open, and attached to the handle by means of the arms a a, substantially as specified.

143,277.—Fire-Kindler.—JOHN C. CRUMPTON, Allegheny City, Pa. Application filed September 12, 1873.

Claim.—A fire-kindler consisting of the wooden box a, having air-spaces b, and filled with shavings, blocks, and other light combustible material slightly saturated with an oily or resinous substance, as described.

143,278.—Horse Hay-Rake.—BURTON J. DOWNING, Mitchell Iowa. Application filed July 19, 1872.

A spring-clutch on the inner end of a stub axle, by means of a chain, locks therewith the rake-head and automatically dumps the accumulated hay by the advance of the propelling power.

Claim.—1. The combination of bent lever O, pawl P, rack Q, spring R, and chain S, substantially as described, so that power applied to the chain first disengages the pawl and then raises the rack, as described and shown.

2. The combination of the bent lever O, pawl P, rack Q, spring R, chain S, arm T, clutch U, bent lever V, spring X, inclined projection Y, and weight Z, with the bar J, and axles B and D, substantially as herein shown and described.

143,279.—Plow.—WILLIAM A. ESTES, China, Mo. Application filed April 28, 1873.

The mold-board and land-side of the plow are exclusively composed of vertical friction-rollers, the former being set in a hinged frame, adjustable laterally at the rear upper corner to adapt it to turning furrows up hill.

Claim.—1. A plow having its mold-board adjustable laterally so as to cause its rear end to incline outward from the bottom at any desired angle, and adapt it to turning furrows up hill, substantially as described.

2. The plow-frame, composed of the rigid bars f f', A, h, and e, and hinged bars r s, provided on each side with the friction-rollers n n' t t, and adapted to admit of the lateral extension or contraction of the plow at its rear end, substantially as described.

3. The combination of the hinged bar r with the arm r', connecting it to the mold-board, the slotted plates c c' connecting it to the bar h, and the hinged slotted arm K connecting it to the handle, substantially as described.

143,280.—Oscillating Gland for Flowing Oil-Wells.—GEORGE FISTON, Meadville, Pa. Application filed July 19, 1873.

The object of the invention is to prevent the escape of oil or gas from oil-wells during drilling, except through orifices which connect with reservoirs.

Claim.—1. An apparatus, consisting of shell A, socket-plates D and E, ball I, extension-tubes J K, and sectional tube M, fastened to the top of the casing of an oil-well, substantially as and for the purposes described.

2. The discharge-openings B and C, substantially as and for the purposes described.

143,281.—Car-Coupling.—JAMES GRIFFITH and WILLIAM F. MILLER, Adamsburg, Pa., assignors to themselves and C. D. B. RISAMAN, same place. Application filed May 5, 1873.

The coupling-bar is jointed in the middle that it may have play enough to couple with cars of unequal height. A block is pivoted in each draw head in such a manner that it will swing inwardly when struck by the head of the coupling-bar and engage with a shoulder thereon. This block is prevented from swinging outwardly by a pin inserted from the top of the draw-head and behind it. Uncoupling is effected by withdrawing the pin.

Claim.—The draft-bar B, made with a guard or stop-joint in its middle part, and shoulders upon the upper sides of its rounded ends, in combination with the boxes A, pivoted blocks C, and keys or stop-blocks D, substantially as herein shown and described.

143,282.—Wheel for Vehicles.—PETER C. HAINSTON, Crawfordsville, Miss. Application filed June 7, 1873.

The hub is formed with a central projecting piece and two detachable collars. The spokes are dovetailed, and, by means of lateral screw connections, are mortised into the collars.

Claim.—1. The combination of hub A, collars B, screws b, spokes C, and tire D, forming the metallic wheel, substantially as and for the purpose described.

2. The combination, with the hub A, having central rim a, and the annular collars B, of the spokes C, provided with dovetailed inner ends, whereby they are secured, as shown and described.

143,283.—Lounge.—WILLIAM H. HART, Lowell, Mass., assignor of one-half his right to AI COLBURN, Nashua, N. H. Application filed May 26, 1873.

To the body of the lounge, on each side thereof and near the head, are attached plates, projecting over the end and having radial grooves on the inside of said projections. To the detachable head of the lounge is a disk having radial grooves on its outer face, which engage with the like grooves on the side plates. Through the center of all the disks, and through the head, passes a rod having a thumb-nut on one end, so that the disks can be pressed together to hold the head in any desired position.

Claim.—The combination of the rod L, the thumb-nut H, the plates I I on the body of the lounge, and the disks F F on the head A, as and for the purpose herein specified.

143,284.—Harness Trace-Buckle.—HILLERY H. HARTSELL, Holden, Mo. Application filed June 7, 1873.

The loop of the buckle consists of two parts, which are divided by a cross-bar. One part is attached to the hame-strap and has a side expansion to embrace a loop on one end of the buckle-frame, and the other part, which is the same width as the frame-loop, and inclines forward, has a cross-bar with a circular recess which locks over the tongue. The lateral bar of the loop on the under side also bears against indentations in the loop of the frame.

Claim.—The combination, with frame A and tongue f, of the

loop C, consisting of parts A and *l* with lateral bar *t*, and tongue-bar F with recess *m*, for the purpose described.

143,285.—Clock and Watch Key.—PHILIP J. HOFFLICHER, Philadelphia, Pa. Application filed December 4, 1872.

By means of two cross-cuts or slots in the end of the key four prongs are formed, adapted to grasp the square of the winding-shaft by its sides.

Claim.—A watch or clock key, having prongs A arranged as shown, so that the pressure, in winding, is exerted upon the sides of the winding-post, the corners of which project between the prongs.

143,286.—Device for Detaching Horses.—ROLLA R. JOHNS, Pillar Point, N. Y. Application filed May 24, 1873.

To the outer end of the whiffletree is secured a fixed and a pivoted jaw, between which the trace is secured. The outer and pivoted jaw may be released by means of lever and spring, allowing the trace to be detached from the fixed jaws.

Claim.—1. The rigid arm B, spring-arm DC, and loop *b'*, combined with whiffletree A, to allow the horse to be released from the shafts by the turning of arm C, in the manner set forth.

2. The combination, with pivoted arms C C, of notched rods E E, pivoted spring-pressed catch F, pivoted plates H H, rods I I, levers J J, and eye-piece L, to enable the pieces C C to be turned, in the manner and for the purpose described.

143,287.—Railway-Gage.—LEONHARD KAYSER, Homburg, assignor to JEAN BAPTISTE CHARLES CAMOZZI and HERMANN JULIUS SCHLOSSER, Frankfort, Germany. Application filed June 27, 1873.

The wheels of one side of a railway-truck are arranged to slip lengthwise their spindles, but are forced outward against the rails by springs. Any variation in the width of the track will obviously correspondingly change the gage of the truck, and a pointer moving over a scale is so connected to one of the wheels as to indicate such variation.

Claim.—1. The construction and arrangement of parts *d*, *h*, *k*, and *l*, for indicating on the graduated scale *m* the inequalities in the distance apart of the rails *a a'* while my improved gaging-machine is being propelled along a line, substantially as set forth.

2. The construction and arrangement of parts *p q r s*, for indicating on the graduated scale *u* the relative elevations of the rails *a* and *a'* while my improved gaging-machine is being propelled along a line, substantially as set forth.

143,288.—Folding Camp-Baker.—FREDERICK LEHNEN, Marquette, Mich. Application filed June 21, 1873.

When the device is folded the staples *s* rest within the cavities *f*.

Claim.—1. The folding camp-baker, consisting of main part A, having extension or back *a*, with hinged top and side plates B C, pan D, and supporting-frame E, substantially as and for the purpose described.

2. The main part A, having indentations *g*, staple *m*, and clasp *n*, combined to lock frame E, as described.

143,289.—Combined Shutter-Worker and Blind-Operator.—DANIEL M. LEONARD, La Crosse, Wis. Application filed August 4, 1873.

A toothed disk is attached to the bottom of the shutter, and a toothed segmental lever is likewise attached upon the inside and connected with the blind-slats. A cog-wheel is keyed on a sliding crank-shaft, which is brought into engagement alternately with the teeth of the disk to open and close the shutter, and with the teeth of the segmental lever to operate the blind-slats.

Claim.—The combination of crank-shaft C and cog-wheel E, arranged in frame A, with toothed disk F, pivoted lever G, shutter B, and spring bolt H, for operating, adjusting, and locking both the shutter and blind-slats, substantially as described.

143,290.—Machine for Disintegrating Fabrics.—MOSES MARSHALL, Lowell, Mass., assignor to himself and DAVID LANE, same place.—Case B. Application filed July 23, 1873.

Two cylinders, with annular blades meshing into each other receive the material from an endless carrier, and the blades are kept from clogging by vibratory cleaners, which enter the spaces between them.

Claim.—For the purpose set forth, the machine, substantially as described, consisting of the two grooved cylinders A B, the vibratory cleaners G H, and the feeding-apron D, combined and operating substantially as specified.

143,291.—Self-Closing Faucet Attachment.—ROBERT MCCONNELL, WILLIAM TRUESDELL, and FREDERICK METTENBERGER, Omaha, Neb. Application filed May 24, 1873.

Into a hollow bushing, provided with external and internal screw-threads, is screwed the barrel of the faucet, forcing back the valve and the packing-disk and admitting the liquid through the orifices in said valve as it passes through a strainer thereto appended. As the barrel of the faucet is withdrawn the valve closes by the action of a spring arranged for this purpose.

Claim.—The self-closing faucet attachment formed by the combination of the tube B, valve C, spiral spring *c*, disk *i*, strainer *l*, and nut *h'*, substantially as and for the purpose described.

143,292.—Crank-Connection for Steam-Engines.—JOHN H. MCGOWAN and DAVID B. CALDWELL, Cincinnati, Ohio. Application filed August 2, 1873.

The piston, working in auxiliary cylinder connecting with the main steam-chest, communicates its motion through bell-crank connecting and coupling rods with crank on main shaft to assist the main crank in overcoming the dead-center.

Claim.—In combination with the driving-shaft I W of a steam-engine, the crank K, bell-crank L *l'* P, connecting-rod M, coupling-rod N, and piston P of the auxiliary cylinder E T, when arranged and adapted to operate substantially as herein described and illustrated.

143,293.—Internal Spring Coupling and Brake.—LÉANDRE MÉGY, José DE ECHEVERRIA, and FÉLIX BAZAN, Paris, France. Application filed January 25, 1873.

The curved blade-springs are inclosed within a pulley or drum working by their own expansive force, which keeps them pressing, more or less closely, against the internal cylindrical face of the said drum or pulley.

Claim.—The open band-spring E, applied on the inside of pulleys, spur-wheels, or analogous devices, in connection with a cam-piece, B C, tight on a rotary shaft, as and for the several purposes described.

143,294.—Ball-Valve.—WILLIAM MENDHAM, Philadelphia, Pa., assignor to himself and W. PRICE DAVIS, same place. Application filed February 1, 1873.

The swiveling of the cap prevents its turning upon the movement of spindle, and the shape of cap lessens wear of ball-valve.

Claim.—1. The combination, substantially as described, with a ball-valve, A, of a cup or plunger, D, swiveled to the valve-stem, and having a semi-spherical recess, for the purpose set forth.

2. The combination, with an elastic ball-valve, A, of a semi-spherical seat, *a*, adapted to the valve, and a semi-spherical plunger, T, between which and the seat the valve can be confined, compressed, and inclosed without materially altering its form, substantially as described.

143,295.—Bee-Hive.—GEORGE MILLER, Battle Ground, Washington Ter. Application filed May 31, 1873.

A number of cells or nests of frames are arranged under and attached to one roof, the whole centrally supported upon one pedestal rising from a reservoir of water, each of the cells being held together by frames forming rigidly-connected parts of the whole, the others sliding in grooves therein.

Claim.—1. An improved bee-hive consisting of a number of cells, E, provided with a roof, L, and supported upon a single shaft, B, from a base A, substantially as herein shown and described.

2. The main frames F, detachable single frames G, and plates H *h'* K, in combination with the cells E of the hive E L B A, substantially as herein shown and described.

3. The combination of the water-vessel C and cover D with the base A and post B of the hive A B E L, substantially as herein shown and described.

143,296.—Taper-Turning Attachment to Lathes.—MICHAEL NECKERMANN, Pittsburg, Pa. Application filed May 10, 1873.

The tool-slide E, movable longitudinally in the usual manner, is at the same time movable transversely through the medium of a toothed wheel M, on its outer end, and other gears connected to a plate suspended from the screw, the one, G, gearing with a stationary rack, B, on the side of the frame; another, J, on the same shaft, gearing with an interchangeable idler, K, interposed between it and that on the screw. Thus, longitudinal movement of the slide necessarily begets transverse movement also, unless the idler be thrown out of gear.

Claim.—1. The combination, with the feed-screw on the cross-slide and the shears of the lathe, of a toothed bar, B, and intermediate wheels connecting the feed-screw and the toothed bar, substantially in the manner described.

2. The combination of the swinging bar L, crank N, shaft O, clamping-rod Q, and clamping-nuts, substantially as specified.

143,297.—Umbrella-Cover.—DAVID W. ODIORNE, Elizabeth, N. J. Application filed August 15, 1873.

Claim.—1. The umbrella or parasol cover made with a metallic eyelet at the center to unite the sections of fibrous materials, substantially as set forth.

2. The washer or ring *c*, combined with the metallic eyelet *b*, for securing the sections *a* of the cover together at the center, substantially as set forth.

143,298.—Mechanical Key and Sounder for Telegraphs.—DAVID L. PARKHURST, San Francisco, Cal. Application filed August 1, 1873.

Underneath lever a thin strip of metal is attached, which gives the sound by being bent or crinkled by the lever.

Claim.—The piece of sheet metal A, with its thin spot or indentation *i*, or equivalent vibrating point, combined with and arranged to be vibrated by a lever, D, and button or rest *g*, substantially as and for the purpose above described.

143,299.—Reclining-Chair.—ELISHA C. RANKS, Boston, Mass. Application filed March 14, 1873.

The back and leg frames are pivoted to the main chair-frame, and the respective sides of the back and leg frames are connected near the main frame by metal rods, and the seat-frame has its side rails notched, so as to fit over said rods. The seat thereby acts in connection with the leg and back frame, but can be detached when desired.

Claim.—The rods *l m*, in combination with side rails *i* of chair-seat, having notches *o p*, the swinging leg-frame *c*, and the swinging back-frame *f*, substantially as described, for the purpose specified.

143,300.—Vehicle Axle-Box.—OLIVER P. RICE, New York, N. Y. Application filed August 4, 1873.

Claim.—The chambered axle-box C, provided with the hollow flange E, and perforated as described, in combination with the perforated sleeve D, and nut K, recessed to embrace the ends thereof, all as shown and set forth.

143,301.—Puddling-Furnace.—EZRA RILEY, Pontnewynydd, England. Application filed September 9, 1873.

Flanges, one attached to the rotary, the other to the stationary, hearth, project downward into an annular trough, the trough being raised or lowered at pleasure by means of the brackets and pinions on top of the furnace gearing with racks attached to rim-pieces supporting the trough.

Claim.—1. A water-vessel and flanges passing into the water, in combination with a revolving puddling-bed, substantially as specified, so as to form a water-lute at the joint, as set forth.

2. In combination with the water-vessel, flanges, and revolving puddling-bed, the means, substantially as set forth, for raising or lowering the trough, for the purposes specified.

143,302.—Railway-Switch.—JOSEPH G. ROCKWELL, Shell Rock, Iowa, assignor to himself and PETER C. WEITZ, same place. Application filed July 26, 1873.

The switch is shifted by the locomotive operating on hinged levers at the side of the track, through rods and bell-crank levers, to move the transverse bar carrying the movable rails. An extension of this bar operates the target-rod by a rack and pinion. The pinion on the target-rod shaft is locked by a pawl, thus preventing the shifting of the switch before said pawl is released.

Claim.—1. The combination of the levers R S, connecting-rods U V, oscillating-shaft L, and arms T and K, with the main rails, switch-rails, and the switch-bar, substantially as specified.

2. The combination of the bell-crank O, rod P, pawl H, pinion F, and target-rod, with the switch-bar D and shaft L, substantially as specified.

3. The arrangement of the holes W *w* in the plates M N for the shaft L with the levers R and S, to actuate the pawl H in advance of the switch-bar, substantially as specified.

143,303.—Shuttle for Sewing-Machines.—WILLIAM H. SCHOFIELD, Somerville, assignor of one-half his right to JOHN F. DONNELL, Cambridgeport, Mass. Application filed April 11, 1873.

The tension is regulated by the amount of thread against which the spring is allowed to bear. The swell on the spring keeps the shuttle-thread from becoming slack, and the hook prevents it from being caught at the pivot of the spring.

Claim.—The tension-spring D, pivoted at *f*, made to hook into the slot *g*, and having the hook *f*, substantially as and for the purpose hereinbefore set forth.

143,304.—Elastic Seat for Railway-Rail Joints.—LEWIS SCOFIELD, Jr., Atlanta, Ga. Application filed August 4, 1873.

A metallic socket-plate is let into the tie and secured by flanges, which project downward over the sides thereof. Its upper surface is recessed to retain the elastic cushion upon which the rail rests, a metallic plate being interposed.

Claim.—The plate E, having the end flanges F and top flange G, and the rabbeted elastic cushion H, combined with the cross-tie C, provided with rabbeted slot or recess, as described, for the purpose specified.

143,305.—Boiler-Furnace.—CHARLES D. SMITH, Chicago, Ill. Application filed June 13, 1873.

A perforated coil of pipe is so placed in the combustion-chamber that the products of combustion will pass entirely around it. Air or vapor is supplied from central or side pipes, and, being completely heated, will escape through the perforations and be consumed.

Claim.—The circular coil or serpentine series of perforated pipes located in the combustion-chamber beneath the steam-boiler, each end of said pipes communicating with the external air for conducting and distributing therein the vapors to be consumed, substantially as herein shown and described.

143,306.—Machine for Making Metal Screws.—CHRISTOPHER M. SPENCER, Hartford, Conn. Application filed March 6, 1873.

The post X on frame S, reciprocated by cam T, is provided with a clutch-sleeve, through which a sliding-spindle passes, on which, at one end, is a threading-die, *m*, and at the other a roll; and above the latter is another roll on a belt-shaft that is intermittingly brought in contact with the first-named roll by lever F and cam E. The rod, fed through and clamped by chuck A, enters die *m* and pushes it back until it clutches with the sleeve, and after the screw has been cut the post and spindle are drawn back and the two rolls brought together, by which a speed is imparted to the spindle greater than that of the chuck, in virtue of which the bolt is screwed out of the die. Tool V is then forced up by cam I and severs the screw from the rod.

Claim.—1. In combination with revolving chuck A having jaws *o o*, the inner and outer sleeves C W, the former, by intermittent reciprocating motion produced by cam H, feeding the stock a suitable length through chuck A; the latter by a similar motion produced by cam I, alternately opening jaws *o o*, to permit the passage of stock, and closing them to hold stock to be operated upon by suitable tools.

2. In combination with clutch *f* and die *m* upon reciprocating turret X, the spindle Q, prolonged to hold the friction-roller *y*, for the purpose of enabling the die to be run off the screw in the direction of its revolution, substantially as shown and described.

3. The combination, with cam H, connection *b*, and sleeve C, and clutch mechanism H L A W, the clutch-bearing turret X and friction-roller R, substantially as shown and described.

4. In combination with cam H, connection *b*, and sleeve C, and clutch mechanism H L A W, the cutter V, operated as described.

5. In combination with the clutch-bearing turret X and friction-roller R, the cutter V, operated as described.

6. The combination with the cam H, connection *b*, and sleeve C, and clutch mechanism H L A W, with the clutch-bearing turret X and friction-roller R, the cutter V, operated as shown and described.

143,307.—Bee-Hive.—CHARLES J. SPERRY and LYMAN CHANDLER, New London, Minn. Application filed May 31, 1873.

A duplex hive, a slotted partition through which bees may pass, and a removable board or plate to stop communication. At each end of the comb-frames a space is partitioned off by a close board and covered by a slat, the removal of which permits the partition to incline to the end. The top horizontal bar of each comb-frame is mortised on its bevel under sides and upward in center.

Claim.—1. The hinged partitions B and top piece *i*, arranged substantially as shown and described.

2. The slat partition O and shutter P, arranged between the two compartments A and B of the hive, as and for the purpose specified.

3. The top bar K of the comb-frames, provided with the apertures U having dividing-bars, as and for the purpose specified.

143,308.—Windmill.—GEORGE STRAHM, Eldorado Mills, Wis. Application filed August 23, 1873.

The slotted elbow-bars cause the hub to slide forward and backward, shifting the vanes by rising and falling. In going downward they turn the vanes so as to take the wind and set the mill in motion, and going upward they turn the vanes out of the wind and stop the mill. A weight, which floats upon the water in the tank or trough, to be filled by the pump, is suspended from the bars and pulls them down and sets the wheel in motion when the water falls. By the rising of the water the bars will be relieved of the weight, and the smaller weight, arranged to lift the bars and turn the vanes out of the wind, will stop the mill.

Claim.—1. The combination of the hollow sliding hub E, arms D, shaft F, inclined slotted angle-bars L, and a floating weight, P', with the vanes B, arranged to revolve on their axes, substantially as specified.

2. The combination of the wheels O and way P with the hollow shaft F, crank-shaft G, and the slotted bars L, substantially as specified.

3. The combination of the regulators R with the inclined slotted angle-bars L, oscillating vanes B, and the weight P', substantially as specified.

4. The arrangement of the U-shaped portion of the frame H to form a bearing, Z', for the front end of the crank shaft, substantially as specified.

143,309.—Metallic Vault.—ALEXANDER L. STIMSON, Chicago, Ill. Application filed August 25, 1873.

A double-walled metallic vault, corrugated and provided with gutters for carrying away the moisture which condenses. Tubular corner-pieces also assist in this function. The air-space between the walls has inlet and outlet ventilation-passages, and one or more gas-jets are provided to assist the circulation of air within the narrow space between the walls, a metallic plate being located over each to arrest the deposit of soot.

Claim.—1. A vault lined with plates of metal, and provided with gutters or tubes for conveying away the fluid produced by the condensation of moisture, substantially as described.

2. The air-chamber *c*, arranged within the walls of a vault, and provided with one or more inlet and outlet passages, substantially as and for the purpose set forth.

3. In combination with the air-space *c*, the gas-burners *a* or their equivalents, arranged to operate substantially as described.

4. The tubular corner pieces C, arranged to serve as tubes for conveying away the accumulated fluid from the walls of a vault, substantially as set forth.

5. The corrugated metallic lining, arranged within a vault, substantially as described.

6. In combination with the hollow wall or air-space of a vault, and a burner arranged to operate therein, the plate *e*, arranged to operate as and for the purpose set forth.

143,310.—Fertilizer from Offal.—JACOB J. STOBER, Boston, Mass. Application filed August 28, 1873.

Claim.—The improved fertilizer herein described, consisting of offal, tank-stuff, blood, or other animal matters, separately or in combination, treated with burning gases directly in contact, so as to impregnate the mass with soot and free carbon, and give a dark-brown or almost black color to the product, substantially as described.

143,311.—Coal-Scuttle.—AMASA S. THOMPSON, Little Falls, Minn., assignor to himself and LOUIS VASALY, same place. Application filed JUNE 8, 1873.

The cover is divided, hinged to the sides, and provided with projecting hooks, which engage with the bail when the same is changed from a vertical to a horizontal position, thereby opening

the device, while the opposite movement of the ball closes the same by bearing against the projecting corners.

Claim.—A coal-scuttle cover made in two parts, C C, hinged to opposite sides of body, and opened as well as closed by the ball B, as described.

143,312.—Turbine Water-Wheel.—JOSEPH E. WHITING, Harford, Pa. Application filed March 7, 1873.

A series of chutes are arranged to revolve around a series of fixed chutes, and they are so adjusted as to control the amount of water admitted to the wheel, while the portion of water admitted is always allowed to enter with its full force and effect.

Claim.—The fixed series of chutes C and revolving series D with means for easily adjusting the latter, combined and arranged relatively to each other and to an inclosed turbine wheel, as and for the purposes herein specified.

143,313.—Life-Preserving Mattress.—JOHN J. WOODRUFF, Hoboken, N. J. Application filed August 9, 1873.

Middle and end sections coupled together by loops so that the end sections will assume a vertical position in the water, whichever side up the mattress falls.

Claim.—A life-preserving mattress having the end sections connected with the middle section by straps F G that interlock, one sliding upon the other and both together, allowing the said end sections to turn up on either side of the middle one, as and for the purpose described.

143,314.—Condenser-Tube Fastening.—SAMUEL ARCHBOLD, Chester, Pa. Application filed August 9, 1873.

A projection on the side of the tube is held in a recess in the plate by packing and a follower, to prevent longitudinal displacement of the tubes.

Claim.—A surface-condenser having tubes, each of which has a projection or collar, *a*, confined to one side of a condenser by a follower and its packing, as set forth.

143,315.—Feed-Regulator for Grinding-Mills.—EPHRAIM H. AUSTIN, Scott's Hill, Tenn. Application filed March 17, 1873.

The invention pertains to the special means of feeding the grain to the spiral passages in the eye of the millstone.

Claim.—The bent arm Z, attached to the top of the stationary curb Y, and projecting downward, as shown, in combination with the spiral passages in the eye of the runner to press the grain into and through the same, as specified.

143,316.—Concealed Jointed Brace for Carriage-Tops.—DAVID W. BAIRD, Geneva, N. Y. Application filed March 25, 1873.

To be used between the rear bows of carriage-tops to prevent collapse of the leather. Opens or "breaks" downward, and is operated by a handle formed on its under side.

Claim.—The stays *a a'* having the enlarged heads *c*, with lateral sockets *d*, for the purpose specified, the stay *a* being formed with the depending handle A, all constructed and arranged as and for the purpose specified.

143,317.—Refrigerator-Building.—WILLIAM S. BATE, Philadelphia, Pa. Application filed June 24, 1873.

Claim.—1. In combination with a series of separate and independent preserving-apartments, two or more, and a single ice-chamber for cooling the same, induction and eduction pipes and a fan or blower, arranged substantially as described, so that a current of cold air may be driven from the said ice-chamber to, into, and through any one or more of said chambers, said current entering at the lower portion or through the floor and passing out through the upper part or ceiling, and returning to the ice-chamber to be used again, the outlets and inlets of said chambers having valves so arranged that any one or more of them may be cut off from the circulation, substantially as specified.

2. In combination with a series of separate and independent preserving apartments, through which an upward movement of air is produced by means of a fan or blower, a single ice-chamber, arranged substantially as described, so that the air-currents from any one or more of said apartments will be forced into and through it in contact with its contents for the purpose of purifying and drying said currents, substantially as specified.

143,318.—Marine Drag.—JOHN C. BEALS, Searsport, Me. Application filed September 15, 1873.

Claim.—The folding wings A A, hinged braces N N, collar S, shank E, and trip-rope O, all combined and adapted to operate as a marine drag, as substantially as set forth.

143,319.—Cotton-Bale Tie.—GEORGE N. BEARD, St. Louis, Mo. Application filed September 13, 1873.

A tie-plate, having a notched horn, is secured in such a manner to one end of the band that the other end of the band, when hooked over the horn, is held securely between the tie-plate and band.

Claim.—1. The tie-plate consisting of a thick back, A, provided with a side flange, *a*, lock-projection F, and a horn, G, so much thinner than the back A as to allow a thickness of the band between the horn and the end B of the band when attached to the latter, substantially as set forth.

2. The combination of band-end B and plate or tie-piece consisting of a back, A *a*, projection F, horn G *g*, and rivets or studs D E all substantially as and for the purpose set forth.

143,320.—Stove-Pipe Shelf.—JAMES F. BECKWITH, Albion, N. Y. Application filed August 8, 1873.

The shelf is formed of three principal parts, with semicircular recesses for inclosing the pipe. The parts are hinged together, and held by lugs and bolts.

Claim.—The stove-pipe shelf constructed of the parts A, B, and F, hinge C, bolt *d*, arms E, wires *g*, and lugs A, substantially as specified.

143,321.—Paper Bag.—LORENZO D. BENNER, Boston, Mass. Application filed August 4, 1873.

Claim.—A paper bag having a series of perforations made near the edge of the paper at the end of the bag to be folded, in order that the paste may pass through to the outer fold to seal both flaps from one application of paste, as set forth.

143,322.—Lasting Mechanism.—LYMAN R. BLAKE, Brooklyn, N. Y. Application filed September 3, 1873.

Claim.—1. A lasting tool or nailer having a guide-passage for the blank set at an inclination to the driver, substantially as shown and described.

2. A lasting tool or nailer having, in combination with the driver, a bender for forcing forward the nail-shank to be severed, substantially as described.

3. A lasting tool or nailer, in which the end of the comb-like blank enters the nail-tube at one angle and is brought to another angle to be severed, substantially as described.

4. The feed-pawl *q* and detainer-pawl *u*, jointed to the levers *r* and *w*, and operated substantially as described.

5. A comb-like nail-blank, having its head formed by bending one edge of the plate, substantially as shown and described.

143,323.—Feeding Device for Coal and Ore Separators.—HEZEKIAH BRADFORD, Reading, Pa. Application filed March 25, 1873.

A cylinder, mounted upon rollers, and having an internal worm or screw, is revolved at a regular speed, and receives the coal from a hopper, conducting it to the chute or slide leading to the separator. A gate in the hopper regulates the amount of coal passing to the cylinder.

Claim.—1. The cylinder *a* and its internal screw or blades *i*, supported by the rollers or wheels *c* and revolved in combination with the mouth *o* or delivery-opening of the hopper *m*, substantially as set forth.

2. The combination of the slide *n*, delivery-mouth *o*, and hopper *m* with the cylinder *a* and feeding-screw or blades *i*, substantially as and for the purposes set forth.

3. A revolving cylinder containing a screw or inclined blades interposed between the mouth of a hopper and a delivery-incline, substantially as set forth, to regulate the delivery of material from said hopper.

143,324.—Weather-Strip.—JAMES W. BROWNE, Brooklyn, N. Y. Application filed August 13, 1873.

Claim.—The weather-strip, composed of the strip of vulcanized india-rubber and a narrower strip of felt or woolen cloth secured together, substantially as described, for the purpose set forth.

143,325.—Lath-Machine.—SAMUEL P. BROWER and WILLIAM H. KNOX, Glen's Falls, N. Y. Application filed May 24, 1873.

The feed-rolls are adjustable independently of each other, or together, and act in conjunction with a system of hinged and adjustable gages to carry the lumber to the saws.

Claim.—1. The combination, with the saw-arbor and removable saws, of the slotted and adjustable tables D D, rods *m m m' m'* passed through the tables, the shafts *n n*, and feed-rollers E E, all constructed and operated substantially as and for the purposes set forth.

2. The combination of the adjustable gage G, having its outer end hinged or jointed, and the adjustable plate *c* attached to the under side of the outer end of the gage, all constructed substantially as and for the purposes set forth.

3. The pivoted lever *f* with wheel *h*, operating through a slot in the front table D, substantially as and for the purposes herein set forth.

4. The combination of the shaft *p* with crank I and arms *r r*, and the rod *s* with arm *t*, for raising and lowering the feed-roller frames, substantially as and for the purposes herein set forth.

143,326.—Manufacture of Water-Traps.—WILLIAM A. BUTLER, New York, N. Y. Application filed June 5, 1873.

The trap is cast with an open slot, through which an instrument can be inserted for removing a sectional core.

Claim.—A water-trap cast with an open slot or with a series of apertures, substantially as and for the purpose described.

143,327.—Mold for Casting Water-Traps.—WILLIAM A. BUTLER, New York, N. Y. Application filed June 5, 1873.

Projections are placed either on the interior of mold or exterior of core to form a slot in the casting for facilitating the removal of the sectional core.

Claim.—The combination of the sectional core A and mold B with the projections *b* or *d*, as specified.

143,328.—Wheel for Vehicles.—JOHN P. CHANDLER and WYMAN V. TAINTER, South Carthage, Mo. Application filed June 21, 1873.

Claim.—In a metallic hub, the combination of the skeleton hub A, having the conical end bearings a^1 a^2 and flanges B, with the partitions *d*, the axle-box C having the conical raised end bearings c^1 c^2, recess c^3, and the advanced face-bearing *e*, substantially as shown and described.

143,329.—Air-Compressor or Blower.—LORENZO CHASE, Portland, Me., assignor to himself and CHARLES W. CAHOON, same place. Application filed February 20, 1873.

Two air-chambers, each provided with valves for the admission and discharge of air, and having a slide-valve common to both for the admission of steam, are placed upon a reservoir which receives the air when compressed. The air and steam inlet-valves are all operated by the same rocker-shaft.

Claim.—1. The combination and relative arrangement of the air-chambers A and A', the air induction and eduction ports C and *c*, respectively, the air-valves D and *d'*, the steam-valve H and h, and the steam-ports *g*, substantially as and for the purpose shown.

2. In an air-compressor, substantially as described, the combination of the puppet-valve stems E, slide-valve stem *h'*, and the rocker-shaft F, substantially as and for the purpose specified.

143,330.—Wood-Sawing Machine.—BENJAMIN F. CLICK, Newark, Ind. Application filed May 31, 1873.

The saw may be adjusted to different lengths of stroke, and the saw-guides have a vertical adjustment in suitable ways.

Claim.—The combination of the frame A, shafts *a b* with pulleys and belt, slotted fly-wheel D, adjustable pitman G, cross-head E with saw-arm and saw-guides h h, adjustable frame J, and saw-guide L, all constructed and arranged substantially as and for the purposes herein set forth.

143,331.—Grain Separator and Scourer.—WILLIAM P. CLIFFORD, West Jersey, assignor of one-half his right to LEWIS and JEREMIAH GARRISON, Elmora, Ill. Application filed March 22, 1873.

The grain is subjected to the action of a fan-blast controlled by peculiarly-arranged valves, and the different grades, as determined by gravity, are collected in separate receptacles.

Claim.—1. The combination of blast-passage G, grain-entry A, valves *a f f*, chamber H, subdivided chambers 1 2 3, valves *r r r*, blast-passage I, fan R, and box *y y*, all constructed and arranged to operate in the manner and for the purpose as herein shown and set forth.

2. The combination of blast-passage G, valve *a*, air-passages *e e*, valves *f f*, screen *i*, grain-ducts *g* 12, and scourer N, all substantially as and for the purpose set forth.

3. The combination and arrangement of the frame A A, B B, C C, and D D, fan R, box *y y*, shaft L, pinions *v u*, shaft M, cam *q*, scourer N T, shaker-rod *n*, arm *o*, spiral spring *p*, shaking-trough P, spout *k*, hopper *i*, and supports *m m*, all substantially in the manner and for the purposes as set forth.

143,332.—Snap-Hook.—JAMES C. COVERT, Farmer Village, N. Y. Application filed October 26, 1872.

Claim.—A snap-hook composed of the tubular shank A, solid hook B, and link E, cast in one piece, and provided with an opening, *a*, the spring C, bolt D, and button *b*, working in an open-end slot in the face of the tube, all constructed substantially as herein set forth.

143,333.—Corner Fastening for Wagon-Boxes.—JASON W. CRANDALL, Homer, N. Y., assignor to himself and WATSON HOLMES, same place. Application filed November 22, 1872.

The inner and outer corner-plates are of peculiar construction, and combined with securing-bolts.

Claim.—The combination of the inner angle-plate having the projection *b* with a wagon-seat corner having a seat-rail, and the outer angle-plates and securing-bolts, as described.

143,334.—Caster.—STEPHEN CURTIS, New York, N. Y. Application filed September 4, 1873.

The bottle-frame has rings for the several bottles, and a continuous rim around these, all cast together; outside of these a band is secured by turning the edge over the continuous rim.

Claim.—1. The center *a*, constructed with a continuous rim, *b*, and separate from the band *c*, substantially as and for the purpose set forth.

2. As a new article of manufacture, a bottle-frame for casters constructed with center and band in separate parts, united without solder by turning the edge of one over the edge of the other, substantially as set forth.

143,335.—Subsoil Attachment for Plows.—EDWARD CUTCLIFFE, East Bethany, N. Y. Application filed July 30, 1873.

From the foot or shovel a standard rises, upon which are adjustably fixed, by sockets and set-screws, a slotted cross-brace for securing the handles adjustably, and a jointed brace for connecting the standard with the mold-board so that the pitch may be varied.

Claim.—1. The cross-brace D, having clips in the slots in each end, adapted to accommodate the varying widths of plow-handles and a collar, D', and combined with standard B, in the manner and for the purpose set forth.

2. The brace C, connected with the standard B at one end, and with the mold-board at the other, and provided with a double or single joint, as set forth.

3. The clips E, when combined with the slotted adjustable cross-brace D, and with the wedges H, and adapted to, and used in combination with, the plow-handles, in the manner and for the purpose set forth.

4. The subsoil foot or attachment combined with the plow-share and handles, and arranged to be moved vertically, and its point raised or lowered, all in the manner and by the means described and set forth.

143,336.—Quartz-Mill.—THOMAS O. CUTLER, Jersey City, N. J. Application filed March 6, 1873.

Two disks which revolve in opposite directions, one provided with a flange or rim that projects close to the base of the other disk, which is furnished with a central feed-opening, and both disks provided with reversible beaters, these on one disk working between those on the other in such a manner that the material fed through the central opening is by centrifugal force thrown violently against and among the beaters.

Claim.—The disk A, provided with the lateral flange *e* and beaters *d*, in combination with the disk A, beaters *c*, and arms *f g*, arranged and operated substantially as described, the disks A B being adjusted in respect to each other so as to leave a discharge-space between the flange *e* and the disk A, as and for the purpose specified.

143,337.—Wagon-Brake.—JOHN F. Durbin, Pana, Ill. Application filed August 2, 1873.

Claim.—1. The lever B and shoe *f'*, in combination with bar G, arm H, and metal bars *m m*, all constructed and arranged substantially as and for the purpose set forth.

2. The combination of levers B D, connected by bar *d*, brake-shoes *f f'*, arm H, keepers h h', and bars *m m*, all arranged for operation substantially as and for the purpose set forth.

143,338.—Cultivator.—JOHN H. FRANK, Millheim, Pa. Application filed August 9, 1873.

Pins are introduced to render the laterally-flexible drag-bars rigid, to adapt the implement for use as a field-cultivator.

Claim.—1. The combination of the frame-bars J J', the single and double pivoted joints, and the screw-bolts *p'* for rendering the drag-bars laterally rigid, thereby adapting the machine to be used as a field-cultivator, as described.

2. The combination of the frame-bars J J', the double and single pivoted joints, screw-bolts *p'*, drag-bars H H', and shovel-standards G, as and for the purpose described.

143,339.—Smoke-Stack for Locomotive-Engines.—ROBERT FRAZER, Camden county, N. J. Application filed August 23, 1873.

The top of the stack is hinged, to facilitate its removal for the purpose of inspecting and repairing the wire-gauze.

Claim.—In smoke-stacks for locomotives, the combination of the wire-gauze E, the band *b*, and the top A, the latter hinged to facilitate the examination of the interior, substantially as described.

143,340.—Circuit-Closer and Circuit for Multiplex or Interval Telegraphs.—MERRITT GALLY, Rochester, N. Y. Application filed September 22, 1873.

Metal stripes of rotating circuit-closer let in diagonally. System of circuits and switches so that any transmitter or receiver may be thrown into circuit for use at any unemployed interval.

Claim.—1. An automatic circuit-closer, having conductors for a single transmitter, in combination with a device for adjusting the same to the different intervals of a multiplex instrument, without necessarily increasing the size of the circuit-closer, or changing the size or number of its segments, spaces, or conductors, substantially as specified.

2. The combination of a group of conductors and a circuit-connector, having a diagonal position in their relation one to the other, for producing lengthened unbroken pulsations by combinations of conductors of the group, substantially as specified.

3. The combination, with a multiplex transmitter or receiver, or both combined, of an automatic safety device, which preserves, in case of stoppage or derangement of the instrument, the proper connection of the main line for the use of other instruments.

143,341.—Multiplex or Interval Telegraph.—MERRITT GALLY, Rochester, N. Y. Application filed September 11, 1873.

Through automatic circuit-closers at the various stations synchronously driven. Definite intervals are allotted to the instruments for communication, so that the wire may be worked to its full capacity by using the intervals necessarily occurring in ordinary transmission.

Claim.—1. An automatic circuit-closer having a group of conductors representing the short dashes of a telegraphic alphabet, and sufficient in number to fill a space equal to the length of the longest letter of such alphabet, in combination with transmitting-keys, each key connecting with such a selection or combination of the conductors of said group as to produce any letter of the alphabet indicated by such key.

2. In a line of instruments arranged for multiplex transmission by allotting to different instruments different intervals of time for operation, the combination, with a transmitter or receiver, of devices for changing such transmitter or receiver from one interval to another, thus setting the instrument to any unemployed interval desired, substantially as specified.

3. A transmitter having in connection therewith an automatic circuit-closer with an interval-circuit, cutting out the transmitter during the intervals not allotted to it for transmission, in combination with devices for allowing the working of the operating-keys during an interval or intervals allotted to other instruments, and holding such key or keys until their proper interval of transmission has arrived, substantially as specified.

4. The combination, with a line of multiplex instruments, of call-receivers, arranged upon a given interval or intervals, allowing all the stations of the line, or any part of the line, to be in constant communication with each other, for calls or explanations, without interrupting the message-intervals, substantially as specified.

5. The combination-key G^2, in connection with its conductors, substantially as specified.

6. The magnetic latch-escapement G *d* D F, or equivalent, for tripping the circuit-closer and correcting its time of revolution without affecting the motor.

7. A circuit-closer made of conductors separated by non-conducting material, having non-conducting bearings for the connector or connectors, which bearings are separated from the conductors by intervening trenches, substantially as set forth.

8. In combination with an automatic circuit-closer, a receiving conductor or conductors, occupying a space equal to a group of transmitting-conductors, from which group combinations are made for producing different characters.

9. The combination, with a transmitter and receiver arranged for a multiplex system of intervals, of devices for securing one interval to the transmitter while another is being used by the receiver, substantially as set forth.

10. The combination of an armature with a number of magnets operating therewith, substantially as specified.

11. The armature of a magnet, in combination with a device which applies positive mechanical force for the return movement of the armature after it has been attracted by the magnets, substantially as specified.

12. A magnetic indicator consisting of a wheel moved by slight friction-power, and stopped or retarded for its indications by means of a magnet.

13. The combination, with a telegraphic transmitter or receiver, of a relay or repeater, which gives its repeated pulsations by means of the return movements of its armature, which impulses are measured by the duration of such return movement, substantially as set forth.

14. The combination, with a register, of devices for setting the same for movement of the paper at appointed intervals, corresponding with the intervals on which it is to receive, when connected with a multiplex instrument, substantially as set forth.

15. In multiplex instruments, a type-wheel and motor combined with a device for securing to such type-wheel its revolutions only for the receiving-interval, substantially as specified.

16. The operating-keys, each having its group of connectors, by means of which it selects from a common group of conductors the proper number and order to produce any letter indicated by such key, substantially as specified.

143,342.—Swinging Gate.—JOHN J. GENTRY and JAMES F. COLLETT, Corinth, Miss. Application filed June 26, 1873.

The upright of the gate next to hinge-post is forked at its lower end to receive a friction-roller, which moves within a double inclined slotted casting fastened near the base of the hinge-post. The gate is also hung to long hinge-rods on the hinge-post by a staple and forked bar.

Claim.—The combination, with the forked end post of the gate with its roller *f*, forked bar *d*, and eye-bolt *e*, of the post A with slotted casting G, staple *e*, and roller A, and the hinge-rod *b*, all substantially as and for the purposes set forth.

143,343.—Cotton-Bale Tie.—J. MORTIMER GOLDSMITH, Boston, Mass. Application filed August 23, 1873.

Metallic fastener having beveled lugs to form a dovetail space, which device is riveted to one end of the band, while the other end of the band is notched. In fastening, the ends are drawn together, and the notched end inserted between the beveled lugs of the fastener.

Claim.—The fastening B having lugs *b b*, beveled, as shown, to form the dovetailed space C of uniform width, and riveted to the band A, in combination with the notches *a a* upon said band, substantially as specified.

143,344.—District and Fire-Alarm Telegraph.—JOHN H. GUZZY, Brooklyn, N. Y. Application filed September 22, 1873.

Combines a series of thermostatic alarms with the normally-closed circuit of a district alarm-telegraph in such a manner as not to interfere with the closed circuit unless acted on by heat, when an alarm is given.

Claim.—The combination, with a district-alarm signal-box or series thereof, of one or more alarm mechanisms operated directly through changes of temperature, and arranged in the normally-closed circuit of such alarm signal-boxes.

143,345.—Pump for Driven Wells.—JOHN W. HARRINGTON, Cincinnati, and JOSEPH A. YINGLING, Hamilton, Ohio. Application filed July 23, 1873.

The internally-tapering coupling rigidly connects the suction-pipe and barrel of the pump. Within the coupling is a check-valve fitted externally with a packing-ring to make a tight joint by crowding down into the conical bore of the coupling, and has a bail for the attachment of a hooked rod to withdraw it when desired.

Claim.—The internally-tapered coupling C, which rigidly connects the suction-pipe A and barrel B of the pump, in combination with the check-valve and seat D D' D'' and the protruding packing-ring E, which is permanently secured in an annular recess of either the valve-seat or the coupling C, substantially as and for the purpose specified.

143,346.—Middlings-Purifier.—JESSE HOLLINGSWORTH, New York, N. Y. Application filed August 7, 1873.

Middlings are purified after being sifted through bolting-reel into the several compartments, by subjecting them to currents of air during their descent into the conveyor, which carries off the light particles of bran, &c., sifted through with the middlings.

Claim.—The combination of two or more grades of bolting-cloth on a reel with two or more fans, regulated as to blast with regard to said cloth, and two or more separate chambers or passages communicating between the bolt and the fans, for the purpose of separating middling material from bran, &c., as described and represented.

143,347.—Marking-Pen.—D. SHEPHERD HOLMAN, Philadelphia, Pa. Application filed July 5, 1873.

Several flexible metallic leaves are joined at their shanks, while their bent ends, overlying each other, are perforated to allow the ink to flow freely.

Claim.—A pen, substantially as shown and described, having a lower plate whose nib determines the maximum width of the stroke, and a superposed plate or plates to carry the ink.

143,348.—Coupling for Gas and Water Pipes.—JOHN HOLMES, Evanston, Ill., assignor of one-half his right to GEORGE WALKER, Salt Lake, Utah Ter. Application filed June 25, 1873.

This invention consists in connecting the ends of pipes together by means of clips, one-half of each clip being cast upon the pipe, and the other separate. The ends of the pipes have an annular mole or flange cast upon them, which is designed to fit the groove in the clips.

Claim.—Sections of pipe having clips at one end and annular flanges at their other for securing them together, as is herein set forth.

143,349.—Cotton-Press.—THOMAS R. JACKSON, Dallas, Tex. Application filed June 17, 1873.

The double diagonal pawls are pivoted on each side of the rack-bar to a vibrating lever. The rack-bar is provided with two rows of reverse-set teeth. Cords are attached to each end of the diagonal pawl, from which weights are suspended, so that either the upper or lower point of the pawl may be caused to engage with the rack.

Claim.—The combination of diagonally-arranged double-acting pawls *g*, follower-rod C with two rows of reverse-set teeth, *n n'*, cords *e e'*, changeable weights *w w'*, and vibrating lever D, substantially as and for the purpose set forth.

143,350.—Manufacture of Cast-Iron from Ore.—PIERRE E. JAY, St. Jean Baptiste, Canada. Application filed March 18, 1873.

Claim.—The treatment of iron ore, before being placed in the cupola or furnace, by wetting it with a solution composed of sugar, nitrate of soda, carbonate of lime, and water, in the proportions specified, substantially in the manner and for the purpose described.

143,351.—Fire-Proof Building.—GEORGE H. JOHNSON, New York, N. Y., assignor of one-half to WM. J. FRYER, Jr., same place. Application filed July 14, 1873.

Claim.—The combination of a series of hollow cylinders, A A, made of fire-clay or other non-combustible material, and held in position and supported by the double and single concave binders or clamps B B C C, made of the same material, all as shown and described, for the purposes specified.

143,352.—Fire-Proof Roof.—GEORGE H. JOHNSON and WILLIAM J. FRYER, Jr., New York, N. Y. Application filed August 12, 1873.

The slabs are hollow and rectangular in form, with rabbets on the upper and lower edges to form a flush lap-joint on both sides. The ends of the slabs rest on the flanges of the hollow supporting-stripe. The whole surface may be covered with metallic paint or Portland cement.

Claim.—The slabs C C, made of baked clay or other non-combustible material, and the supporting-stripe B B, made of baked clay, metal, or other non-combustible material, resting on wood or metal beams or rafters to carry the same, as shown and described, for the purposes specified.

143,353.—Horseshoe.—JAMES B. JOHNSTON, New York, N. Y. Application filed May 26, 1873.

The key is arranged transversely between the head of the calk and face of the shoe and entirely clear of the screw-stem. In this situation the key forms a resistance to injurious blows directed parallel to the face of the shoe.

Claim.—The combination of a shoe, A, with a removable calk, C, attached to the shoe by a screw-stem, and secured from turning by means of a key embedded between the shoe and the lower face of the calk, substantially as described, for the purposes set forth.

143,354.—Garden-Weeding Implement.—WILLIAM JONES, New Albany, Ind. Application filed August 1, 1873.

Upon a toothed frame is formed a socket for containing a handle and a blade for cutting the weeds.

Claim.—The within-described garden implement, consisting of the frame A, with socket C, teeth B B, and blade D, all constructed and arranged substantially as and for the purposes herein set forth.

143,355.—Rock-Drill.—DANIEL KENNEDY, Brooklyn, N. Y. Application filed March 24, 1873.

The steam-valve and the feeding mechanism are operated by means of a plunger, which is arranged within the main piston.

Claim.—1. The piston of a rock-drill made of a large part, B, and a smaller part, B', the part B' being grooved, as at *i*, to admit steam to its upper ends, as described.

2. The piston B of a rock-drill, carrying the grooved tubular piston B', and combined with the loose nut I and ratchet-wheel *d*, to operate substantially as herein shown and described.

3. The plunger J, arranged within the piston B', and connecting with the disk or plate *l*, to actuate the steam-valve and feed mechanism, substantially in the manner set forth.

4. The reciprocating disk or plate *l*, arranged within the cylinder A, in combination with the three-pronged lever M and spring-pawl N, to actuate the slide-valve H and feed-screw D, substantially as herein shown and described.

143,356.—Straw-Cutter.—AUGUST KINDERMANN, Cleveland, Ohio. Application filed June 2, 1873.

Directly over the pair of feed-rolls is the hopper, which has an articulated cover held up means of a spring. The straw passes from the rolls between two bars, which are provided with stationary shear-blades, beneath which a horizontally-reciprocating shear-blade operates.

Claim.—The hopper B, provided with the guide-board *b* and spring-cover *b'*, and the two toothed feed-rollers C C', each having a positive motion, and the blocks E E', forming the narrow opening, all located directly above the knife F, all constructed and arranged for operation, as and for the purpose specified.

143,357.—Machine for Sorting Potatoes.—DAVID M. KING, Garrettsville, Ohio. Application filed July 31, 1873.

An inclined endless screen or riddle runs over sprocket-wheels carrying the potatoes—after sifting out the dirt—onto another coarser screen running at a greater rate of speed, by which the small potatoes are separated. To the end of the frame is attached a bag-holding device, adjustable to height of different bags.

Claim.—1. The combination, in a potato-sorting machine, of a coarse, endless, rapidly-moving screen, D, for sorting the potatoes, and a finer, endless screen, C, projecting over it, for first sifting out the dirt, substantially as described.

2. The combination of the bag-holding hooks G on the discharge end of the machine with cord *g* and weight *g'*, for adapting the same to bags of different height, as described.

143,358.—Paper-Bag Machine.—WILLIAM LIDDELL, Buffalo, N. Y., assignor of three-fourths his right to ROBERT D. HAMLIN, same place. Application filed August 11, 1873.

The web of paper is passed from a reel over a guide-roll at one end of the machine, above its bed, where paste is applied to one edge, whence it passes under and is partially creased for side folds by two suspended curved formers. The partially-creased edges are directed under two bracket-creasers, arranged on or near the edge of the folding-table, by which the creases are completed. Two spring-punches, arranged upon the bracket-creasers, are automatically precipitated, cutting out or nicking the edge or crease made by the brackets, which insures the complete separation of a bag-length by a stationary knife and two cutters arranged on rollers and operating alternately to hold and cut from the upper and under sides of the blade. Feeding-rollers, in advance of the cutting devices, insure the travel of the web and also roll down the crease. The severed bag-length travels over tapes, and its forward end is projected over pressure-rolls the required distance, when a revolving pasting-brush pastes the end of the blank; a folding-blade then descends, upturning the pasted end and directing the fold between the pressure-rolls, forming the bottom and completing the bag.

Claim.—1. The combination, in a paper-bag machine with a stationary blade or cutter, of the rollers G G' provided with cutters g^1 g^2, substantially as and for the purpose hereinbefore set forth.

2. The combination, with the stationary blade K, of the supporting-arm K', attached thereto, so as to permit the passage of the overlapped and unfastened edges of the folded-paper tube, substantially as hereinbefore set forth.

3. The combination, with the rollers F F', the former provided with a recess, *g*, of the stationary knife and arm K K' and ledge *k'*, substantially as and for the purpose hereinbefore set forth.

4. The combination, with the knife and arm K K', and roller F provided with recess *g*, of the adjustable screw *k*, arranged substantially as and for the purpose hereinbefore set forth.

5. The combination, with the guide-roller *b* and curved gages C C, of the edge punches E and guide-brackets *d*, substantially as and for the purpose hereinbefore set forth.

6. The combination of the edge punches E, striking-arms *e e*, and rock-shaft *e'*, substantially as and for the purpose hereinbefore set forth.

7. The combination, with the edge punches, rocking shaft *e'*, and striking-arms *e e*, of the plate n^2, return-spring n^3, pawl *n'*, oscillating arm *n*, pitman *m'*, and crank-arm *m*, substantially as and for the purposes hereinbefore set forth.

8. The combination, with the cutter-rollers G G' of the elliptical gear-wheels L L', for imparting a variable motion to the cutter-rollers, substantially as and for the purpose hereinbefore set forth.

9. The combination, with the shaft P actuated by the counter-shaft O, of the revolving pasting-bar S, folding-blade, and rocking arms *p' p*, rocking lever *r'*, and cam *r*, substantially as and for the purpose hereinbefore set forth.

10. The combination, with the shaft P, of the arms *s s* and paste-roller *u*, pivoted pasting-blade S provided with arm *s'*, and resetting spring *t*, substantially as and for the purpose hereinbefore set forth.

143,359.—Corset-Clasp.—PHILLIPP LIPPMANN, New York, N. Y. Application filed November 7, 1872.

Claim.—As a new article of manufacture, a covered corset-clasp, the cloth of which forms a marginal flap or flaps along its length suitable for and adapted to being sewn upon the corset, substantially as described, and for use in the place of broken, injured, or worn-out clasps or cloth, as herein set forth.

143,360.—Fare-Box.—SAMUEL H. LITTLE, Rosemead, Ill., assignor of one-half his right to WILLIAM D. LITTLE, same place. Application filed July 21, 1873.

The tilting shelves are operated by means of the tri-armed lever and connections when the door is pushed back to deposit the fare. By means of the lever R the driver can suspend the operation of the shelf H, by disconnecting the rod O, until he has examined the fare.

Claim.—1. The combination of the door B, stud *b*, lever K L M, rods N and O, and shelves G and H, all arranged and operated as described.

2. The combination of the door B, stud *b*, lever K L M, rod N, shelf G, rod O, shelf H, and lever R, all substantially as set forth.

3. The inclined slide F, the shelf G, consisting of the parts *g g'* set angularly to each other, and the shelf H consisting of the three parts A A' A'', all arranged, relatively to each other, substantially as shown.

143,361.—Skirt-Protector.—JULIA C. LIVERMORE, Boston, Mass. Application filed August 1, 1873.

A broad water-proof band is suspended from a waistband by connecting-bands underneath the dress-skirt. Its lower edge is turned up, and it incases the bottom of the dress.

Claim.—The skirt-protector consisting of the waistband B, bag portion A, connecting-bands C, and the furcated front connecting-piece D, all constructed and arranged as specified and shown.

143,362.—Lubricating Compound.—SAMUEL Y. LOVE, Philadelphia, Pa., assignor to LOVE BROTHERS, same place. Application filed August 4, 1873.

Claim.—The within-described lubricating composition, consisting of petroleum, petroleum products, resin, and lime-water or alkaline liquid, treated and compounded with or without flour, grease, or gums, substantially in the manner described.

143,363.—Railroad-Car.—FRANÇOIS MARIN, Geneva, Switzerland. Application filed July 1, 1873.

Each railway-carriage is provided with supplemental wheels, one at each corner of the frame, of small diameter, and set at a certain fixed angle thereto. These wheels act in conjunction with an elevated rail upon the outside of curves of small radius.

Claim.—The supernumerary wheels B, set at an angle, and applied to a locomotive or railway-carriage, A, in combination with the elevated outside rail E of the curve of a railway-track, as and for the purpose specified.

143,364.—Tag-Hook.—THOMAS P. MARSTON and NATHAN M. PHILLIPS, New York, N. Y., assignors to NATHAN M. PHILLIPS. Application filed January 6, 1873.

The shank of a spring-wire hook is bent to form a horizontal loop, into which the free end engages and is held.

Claim.—The self-locking spring-hook having the simple offset 3, formed with a curve, as shown, for the purposes specified.

143,365.—Clamp for Securing Advertising-Boxes to Lamp and other Posts.—PETER MCCOSKER, Pittsburg, Pa., assignor of one-half his right to HENRY SCHMIDT, same place. Application filed January 17, 1872.

The two arms or shanks upon which the box rests are arranged each to project from an opposite end of each of the two semicircular bands composing the clamp, instead of both.

Claim.—In combination with the box or advertising medium D applied to a post, substantially as shown and described, the supporting-clamp consisting of the two curved sections C C, united by means of the transverse bolts H H, said sections having each a threaded arm, B, projecting, respectively, from opposite sides of the clamp and holding the nuts G, substantially as and for the purpose specified.

143,366.—Scarf-Ring.—ALFRED P. MATHEW and ISAAC D. LEONARD, Newark, N. J. Application filed September 15, 1873.

A catch, having one or more points on its lower end, is hinged on the inside of the ring. The points engage with the scarf and prevent the ring from slipping off.

Claim.—The combination of the ring *a* and the hinged or jointed catch *c*, substantially as specified.

143,367.—Wrench.—ALONZO D. MCMASTER, Rochester, N. Y., assignor of one-half his right to ISRAEL SMITH, same place. Application filed March 6, 1873.

The movable jaw is provided with a tapering shank adapted to enter a socket in the handle.

Claim.—The handle A, formed with the socket *a* and groove *d*, and having ratchet-teeth *f*, and supporting the clamping-sleeve

C, in combination with the shank B, having the rib *d'* and ratchet-teeth *f'*, all constructed and arranged to operate substantially as described.

143,368.—Car-Coupling.—DAVID M. MILLER, South Bend, Ind. Application filed August 28, 1873.

The center lever of the rock-shaft serves to depress the spring which actuates the pin and retain it until the draw-head is struck by that of the approaching car, when a stop on the bottom of the draw-head throws the short arm of the lever to the rear and relieves the spring, so that the pin is forced up in position. An india-rubber cushion, placed around the pin between its collar and the straight spring, serves to provide the necessary oscillation as the pin is drawn outward.

Claim.—1. The combination of the draw-head A, having a projection, *a*, pin B, spring C, and lever or prop E, substantially as and for the purpose specified.

2. The combination of the draw-head A *a*, pin B, spring C, lever or prop E, and rock shaft or rod D, extending to the sides of the car, substantially as and for the purpose specified.

3. The combination of the pin B, spring C, and rubber or other spring *b*, substantially as and for the purpose specified.

143,369.—Car-Coupling.—JOHN DIX MILLS, Alexandria, Va. Application filed July 22, 1873.

The peculiar shape of the coupling-heads allows of one of the heads rising over the other, so that they couple vertically and are locked on a horizontal plane. Uncoupling is effected by depressing either one of the draw-heads.

Claim.—1. The described hook, having the recess a^2 and point a^1, with equal and similar inclines, the hook being adapted to move vertically to couple with its fellow, and hold the head of the same by means of the recesses a^2 in the same horizontal plane, all as shown and and described.

2. The combination of the pivoted socket *x* with the hook A and spring *x'*, as and for the purpose described.

143,370.—Lubricating Car-Wheel.—JOHN H. MURRAY, Hollidaysburg, Pa. Application filed August 9, 1873.

Claim.—The loose feeding-plug H, in combination with the short tube G, the oil-chamber D, and the adjusting screw-plug F for regulating the length of the feeding movement of the plug H outside of the tube, as shown, and for the purpose described.

143,371.—Washing-Machine.—GODFREY S. NEWSOM, Edgefield, Tenn. Application filed August 1, 1873.

A washing-box has an elevated extended part, in which the devices operate. The main box is divided by a strainer. A hollow perforated cylinder has grooves on its surface, in which are laid curved rods connected with the strainer and small roller. Water is forced from the box by means of a pump and pipe, and distributed upon the rollers, and all operated by suitable gearing.

Claim.—1. The combination of the box *a*, provided with an elevated extension for support of operating mechanism, with roller *c*, and operating mechanism substantially as set forth, all arranged and operating to keep the goods being washed elevated above the sediment or "dirty suds" that settle at the bottom of compartments *a* and *a*.

2. In a washing-machine, the hollow perforated grooved cylinder *c*, upon which the clothes are rubbed, substantially as set forth.

3. In a washing-machine, the rods 4, permanently attached at one end, passing over the cylinders *c* and *u*, as and for the purpose set forth.

4. The combination, in a washing-machine, of the force-pump *p*, provided with induction and eduction pipes, with perforated pipes 3 3, substantially as shown and described.

5. The shaft *d*, eccentric *l*, connecting-rod *n*, and frame 1, in combination with cylinder *c*, substantially as set forth.

6. The combination, in a washing-machine, of the wash-frame 1, having rollers 2, with the cylinder *c*, substantially as shown and described.

7. The combination of the rollers *c u* 6, and rods 4, substantially as described.

143,372.—Portable Fence.—HENRY W. NICHOLS and RUE P. NICHOLS, Northfield, Ind. Application filed June 27, 1873.

The lower ends of the adjacent panels are provided with hooked rods, which engage with T-shaped metallic ground-stakes. Cross-braces, which enter the ground, come between the ends of the adjacent panels, and are united near their tops by pins, which pass through them and into the ends of the panels.

Claim.—The combination, with two fence-panels, A A, of the metal post E, hooks *a a*, pin *b*, and braces C C, substantially as and for the purposes herein set forth.

143,373.—Spring Bed-Bottom.—CHARLES W. NORTHRUP, Utica, N. Y. Application filed April 18, 1873.

Spiral springs rest on slats. Each spring has on its top a square flat block, which are all tied together by rattan slips—a double row across the blocks laterally, and a single row longitudinally, to the bedstead.

Claim.—The combination of the springs *s*, attached to blocks G and slats *a*, and strips of rattan R, all arranged substantially as described, and for the purpose set forth.

143,374.—Register-Point-Perforating Devices.—WILLIAM OVERHEID, Cincinnati, Ohio, assignor to EDWIN CHAMBERS and CYRUS CHAMBERS, Jr., Philadelphia, Pa. Application filed April 30, 1873.

A strip carrying perforating-points is adjustable upon the tympan-bed.

Claim.—In combination with the tympan of a printing-press, the adjustable bars C C' with the attached punch-heads D D, constructed and operating substantially as and for the purpose specified.

143,375.—Eaves-Trough Hanger.—THOMAS F. PALM, Toledo, Ohio, assignor to ISAAC H. HAMPTON and THOMAS F. PALM, same place. Application filed September 6, 1873.

Claim.—The one continuous wire A, passing under and over the trough, provided with the loop C, and having the ends made fast, substantially as and for the purpose described.

143,376.—Coil-Holder for Wire, &c.—ISAAC E. PALMER, Hackensack, N. J. Application filed March 24, 1873.

Two open wheel-like disks are kept in place by rods attached to one and passing through holes in the other. The upper disk is adjustable by spring-clasps.

Claim.—1. A coil-holder composed of sections or disks B B', constructed and arranged to support and hold the coil in between them, and provided with central eyes *b b*, substantially as and for the purposes herein set forth.

2. A coil-holder having its sections, heads, or disks B B' adjustable in relation with each other, essentially as herein set forth.

143,377.—Drill-Chuck.—LEANDER PARMELEE, New Haven, Conn., assignor to himself and MERRITT HINE, same place. Application filed May 28, 1873.

Claim.—The head A, having two or more levers, C C, arranged therein as described, and provided with the spindle B, by means of which the head is secured in the lathe, and conical sleeve E, threaded to move longitudinally on the said spindle, combined with the jaws D, pivoted upon the forward ends of the levers so as to swing longitudinally, all substantially as described.

143,378.—Vehicle-Wheel.—LAWSON G. PEEL, Hazlehurst, Miss. Application filed February 19, 1873.

The axle-box and hub are formed together of two tubular pieces. The inner one has a fixed flange, and the outer one a loose flange, between which the spokes are clamped.

Claim.—The combination of the tubular piece A with stationary flange C, the tubular piece B with shoulder *a* and the movable flange E, and the parts A and B, provided with male and female screw-threads, all substantially as and for the purposes herein set forth.

143,379.—Portable Burglar-Alarm.—JOSEPH PENNEPACKER, Philadelphia, Pa. Application filed January 8, 1873.

A bell is attached to a screw-clamp for securing it to a door-jam, the clamp carrying a curved spring-hammer, and a detent-rod for holding back the same by means of a notch in the spring, so that, when touched by the opening of the door, the hammer is released and strikes the bell.

Claim.—1. The combination, with the bell A, of the detent E, extending some distance across the door when the alarm is applied, and the spring-clapper F G, the spring F of which, when hooked upon the detent, bears against the door, substantially as and for the purpose specified.

2. The combination of a bell, A, the adjustable clamp, composed of the bar B B', bolt and nut *a a'*, slotted bar C *c*, movable jaw C', and screw and nut D D', the bar E provided with detent *e* and the spring-clapper F G, a notch being cut in the edge of the spring at *f*, all substantially as specified.

3. In a burglar-alarm, substantially such as described, the spring-clapper and detent, when made adjustable, as specified, so that they may be swung around out of the path of the door.

143,380.—Cultivator.—FELIPE PEREZ, Havana, Cuba. Application filed August 4, 1873.

Two pairs of side bars, farthest apart at the center, and converging at each end, carry in front a series of cutting blades. Behind them is a horizontal blade or scraper extending across the entire width of the frame, followed by harrow-teeth.

Claim.—A cultivator composed of a forward supporting-roller, E, of the cutting-blades F F, horizontal transverse blade H, and pointed teeth J J, to operate on light soil, substantially as herein shown and described.

143,381.—Harness Saddle-Tree.—MARTIN W. POND, Elyria, Ohio. Application filed September 11, 1873.

Claim.—1. A separate fixed core-bearing for the joints in combination with a center-hinged self-adjusting harness saddle-tree, essentially as described.

2. The separate core *d* and the independent cap *m*, secured together by means of the check-hook *r* to cover the united joints of the tree, essentially as described.

3. In a center-jointed self-adjusting harness saddle-tree, a fixed core-joint bearing, *d*, constructed to form stops to the joints, essentially as described.

143,382.—Bracelet-Fastening.—BETHUEL RANGER and JAMES B. SMILEY, Brattleborough, Vt. Application filed May 5, 1873.

Claim.—The combination of an ordinary V-spring clasp with a pivoted push-piece, which, when upright, serves as a push-piece to compress the spring, and, when upset, or turned down, interposes between the two leaves of the spring and prevents its compression.

143,383.—Comb-Frame.—WORCESTER RASEY, Remington, Ind. Application filed August 2, 1873.

Each frame consists of a horizontal top bar having annular grooves and sharp ridges upon it, its ends adapted for seating in

V-shaped recesses, a piece of wood or metal bent rounding as a bracket or staple; its two ends attached near the ends of the described bar, wires being stretched from the bar diagonally and horizontally at the side or sides to retain the comb.

Claim.—1. A comb-frame for bee-hives formed of the top bar A turned to form the circumferential sharp edges *a a*, and having the edge *b* at each end on the under side, and the bar B bent to form the round corners *d d*, all as herein set forth.

2. The combination, with the comb-frame A B, of the screws or pins *e e* and wires *f f*, as and for the purposes herein set forth.

143,384.—Manufacture of Plaster Patterns.—JAMES SEMPLE, Chicago, Ill. Application filed June 25, 1873.

Claim.—1. The combination described, with a mold, A a^1 a^2, for making plaster patterns, *a*, of a collapsible core, B, centered by bits of plaster placed between it and the mold, which become consolidated with the liquid plaster, as set forth.

2. A collapsible tubular core, B, provided with valve-seat tube *b*, and a threaded hollow valve-plug, *b'*, laterally perforated, as and for the purpose specified.

143,385.—Burner for Carburetors.—IRA W. SHALER, Brooklyn, N. Y. Application filed June 23, 1873.

The outer cylinder of an argand burner rises above and bends inwardly over its inner cylinder, causing the circle of flame to tend toward its center and then upward.

Claim.—The hollow arm 4, cylinder-body 3, and jacket 5, the jacket 5 extending above and curved inwardly over the top of the body 6, substantially as shown and described.

143,386.—Preparing and Preserving Fish.—WILLIAM SHARP, Portland, Me. Application filed February 3, 1873.

Claim.—1. The process of preparing and preserving fish as an article of food by smoking, and subsequently canning and boiling them in the cans, substantially as described.

2. The improved article of manufacture, obtained by first smoking the fish and subsequently canning and boiling them in the cans, as and for the purpose set forth.

143,387.—Sewing-Machine Caster.—JAMES E. SMITH, Sharpsburg, assignor to himself and THOMAS J. PETERS, Owingsville, Ky. Application filed April 16, 1873.

The housing or frame of a caster-wheel is provided with open curved slots for the gudgeons to work in. The periphery of the caster is notched or corrugated, so that it will readily engage with a fixed detent within the housing, thereby locking the caster. This construction applies to two of the casters of a sewing-machine table, allowing it to be trundled over the floor or held locked against ordinary displacement.

Claim.—A locking and releasing caster, whose roller is corrugated on its periphery *c'* to engage in one position with its detent F, and in its other position to be free therefrom, its gudgeons *s* occupying, for this purpose, curved slots *d* in the housing D, substantially as set forth.

143,388.—Tacking-Machine for Boots and Shoes.—DAVID M. SMITH, Lynn, Mass., assignor to HENRY G. THOMPSON, Milford, Conn. Application filed June 27, 1873.

Claim.—1. A magnetic hammer for the purpose of receiving, holding, and driving a tack through the upper of boots and shoes into the inner soles thereof, combined with automatic machinery constructed for operating and feeding the same, for the purpose set forth.

2. A magnetic hammer, in combination with the non-magnetic feeding devices, substantially as described.

3. The combination of the spring push-bar, provided with the nut and catch, with the sliding bar, having a projection and adjustable stop, and the mechanism for operating the same, substantially as shown.

143,389.—Shank-Stiffener.—WATSON N. STRAGUE, Keene, N. H., assignor to himself and GEORGE GOODYEAR, Elizabeth, N. J. Application filed June 27, 1873.

A shank-stiffener formed of a strip of wood and strip or strips of leather or leather-board glued together or otherwise secured, so that the latter prevents the former from splitting, and full elasticity, with sufficient thickness, is secured to the shank.

Claim.—A shank composed of two or more thicknesses of the materials herein specified, for the purpose set forth.

143,390.—Gas-Meter.—WILLIAM A. TELLING and SAMUEL JOHNSON, Wood Green, London, assignors to THE IMPERIAL METER COMPANY, London, England. Application filed July 7, 1873.

The slide-valve, which controls the flow of the gas, is operated by a weighted lever, which is thrown from side to side by two pins upon an arm of a rock-shaft operated by the diaphragm, the latter being provided with a weighted balance-lever. The parts of the first-mentioned lever, with which the pins come in contact, are curved to reduce friction.

Claim.—1. The combination, with the diaphragm in a dry gas-meter, of the weighted balance-lever G, arranged so that it assists in lifting the weighted lever *p* used for reversing the slide-valve *w*, and thus renders the action of the diaphragm continuous and equable, substantially as described and shown in the drawing.

2. The combination, with the pins *m m'* driven by the diaphragm, of the curved or cycloidal-shaped weighted lever which drives the slide-valve *w*, so that the downward pressure upon the pins is reduced, substantially as described and shown in the drawing.

143,391.—Harvester-Dropper.—JOHN S. TRUXELL, Greensburg, Pa. Application filed February 27, 1873.

The shaft upon which the dropper vibrates passes through the hollow reel-shaft and supports the dropper at both ends.

Claim.—The combination of the hollow reel-shaft D, bars F H, and dropper A, substantially as and for the purpose specified.

143,392.—Device for Suspending Hammocks.—OTIS TUFTS, Boston, Mass. Application filed August 12, 1873.

Two standing rods connected near the bottom by a horizontal rod with sockets on its ends. On each upright there is a sliding head with sockets, in which are inserted the ends of brace-rods that extend inwardly to the ground. All the sliding parts are adjustable by set-screws.

Claim.—1. A hammock-support having suspending-heads *a b* and movable rods *g h e*, constructed and connected substantially as described.

2. In combination with the adjustable stands, the connecting-rod *m*, substantially as shown and described.

143,393.—Capped Nail.—CORNELIUS WALSH, Newark, N. J. Application September 17, 1873.

Claim.—1. A nail having a sheet-metal cap attached by folding two thicknesses of the same around and beneath the nail-head, substantially as herein described.

2. A finishing-nail consisting of a common small-headed nail, A, and a sheet-metal cap, B, the latter being attached by contracting a central portion thereof in a double fold beneath the nail-head, and completed by stamping this central portion and the margin or rim of the cap into ornamental shape, substantially as herein specified.

143,394.—Revolving Fire-Arm.—ROLLIN WHITE, Lowell, Mass. Application filed August 27, 1873.

Claim.—1. In a revolving fire-arm, a cartridge-extractor, the stem of which is entirely within the cylinder thereof, and adapted to be operated by a piston projecting within the cylinder, as and for the purposes set forth.

2. In combination with a cartridge-extractor, the stem of which is entirely within the cylinder, a pawl or piston for moving or operating the extractor in the act of tilting the barrel, as described.

3. The shipping-stud 7, in combination with the cam *i*, pawl 1, and a spring for returning the extractor to its seat, as specified.

4. The adjustable stop 8, for automatically releasing or unshipping the pawl 1 at any desired or predetermined point in the act of tilting the barrel, as described.

5. The cam *i*, in combination with the pawl 1, stop 8, and piston for operating the cartridge-extractor, substantially as specified.

6. The combination, with a hinged barrel of a fire-arm, of the pivoted spring-locking bolt *i* having projection *k*, the slotted spring-locking plate *h*, and the projections *j* on the breech, all substantially as and for the purposes herein set forth.

7. The combination of the hammer *a* and spring-bolt *b*, having the double bearing shown, whereby a rebounding lock or hammer is obtained, as set forth.

143,395.—Coal-Separator.—JOHN B. WILFORD, Reading, Pa., assignor to HEZEKIAH BRADFORD, same place. Application filed March 25, 1873.

Rollers, connected to the frame of the machine, are placed so that the rake-handles rest upon them at the completion of the upward movement, the rollers becoming fulcrums to elevate the rake on the return movement.

Claim.—The rake reciprocated by the crank *o'*, in combination with mechanism that acts upon the rake-handle to lift the rake upon the return movement, and with the incline *P* and separating-jig, substantially as set forth.

143,396.—Squib for Blasting.—SAMUEL HARRIS DADDOW, St. Clair, Pa. Application filed October 20, 1871.

Claim.—As a new article of manufacture, the squib with a match permanently attached thereto, substantially as shown and described.

REISSUE PATENTS.

5,580.—Speaking-Tube.—JAMES R. CRICHTON, Boston, Mass., assignor of one-half interest to OSBORN B. HALL, 2d.—Patent No. 91,827, dated June 29, 1869. Application filed September 6, 1873.

A tilting valve leans lightly against the mouth of a speaking-tube, and is connected with an alarm which is set off when a current of air blown through the tube drops the valve.

Claim.—1. The combination, with a speaking-tube, of a tilting-plate valve pivoted in such manner that upon blowing within the tube such device is so tilted or operated as to release or set in motion a suitable alarm or signal connected with the same, substantially as and for the purposes stated.

2. The combination, with a speaking-tube, of a tilting valve, whose support is a rock-shaft located immediately at one extremity of the tube, the overbalance of the valve against or toward the tube being so slight that a current of wind from within the tube against the valve will overcome and drop the valve, substantially as and for the purposes stated.

3. The construction and arrangement of the tilting arm *g* with its knob *f*, the rocker-shaft *b* with its tripper *d*, and finger *h*, and

the oscillating lever *e*, the latter being actuated by the spring and disposed in connection with the rocker-shaft and an alarm mechanism, and the whole being arranged and operating substantially as hereinbefore explained.

5,581.—Machine for Bending Tubing.—WILLIAM T. FARRE, Montreal, Canada.—Patent No. 133,636, dated December 3, 1872.—Division A. Application filed June 30, 1873.

The bending is of cast tubes having a surplus of metal on one side, at the point where the bend is required, the surplus metal being reduced to a thickness uniform with the rest of the tube by the drawing blows of a revolving beater over the extremity of a mandrel, in virtue of which the metal at that point is extended, and the tube consequently deflected from a straight to a curved line.

Claim.—1. The combination, with the die F and mandrel D, of the revolving plate-die E, the construction and combination of the parts, and the mode of operation of the combination, being substantially as specified.

2. The combination, with the threaded mandrel-stem L and the lifting-bar O, of the intermediate mechanism, through which feed-movement is imparted to the tube, substantially as described.

5,582.—Method of Bending Tubing.—WILLIAM T. FARRE, Montreal, Canada.—Patent No. 133,636, dated December 3, 1872.—Division B. Application filed July 17, 1873.

The bending is of cast tubes having a surplus of metal on one side, at the point where the bend is to be made, the surplus metal being reduced to a thickness uniform with the rest of the tube by the drawing blows of a revolving beater over the extremity of a mandrel, in virtue of which the metal at that point is extended, and the tube consequently deflected from a straight to a curved line.

Claim.—The method or art of making bent tubes of soft metal, of a single piece of metal, without a seam, by casting a tube with surplus metal where the outside of the bend is to be, and then forming the bend by bending or rolling the surplus metal to a uniform thickness with the rest of the tube without increasing the diameter, substantially as described.

5,583.—Cooking-Stove.—GEORGE H. PHILLIPS, Troy, N. Y.—Patent No. 63,790, dated November 3, 1868; reissue No. 4,063, dated July 5, 1870. Application filed May 15, 1873.

Claim.—1. The boiler-hole top-plate of a cooking-stove connected with the top of a reservoir, which is against and partly above the rear vertical end plate of the stove, (the top edge of said vertical end plate being on a line with the boiler-hole plate A extended rearward,) by means of an inclined plate or molding which joins the boiler-hole top-plate at a point over and above the descending and ascending flues of the stove, and therefrom extending upward, outward, and backward, until it unites with the reservoir-top, substantially as herein described and set forth.

2. The combination of a water-reservoir at the back of a cook-stove, against and partly above the upper edge of the rear vertical end plate C, which plate extends from the stove-bottom up to and terminates on a line of the boiler-hole top extended rearward, with a chamber or chambers formed, in part, by the front of that part of the reservoir which is above the upper edge of said rear end plate, and an inclined plate or molding which connects the boiler-hole top of the stove with the top of the reservoir by its upward, outward, and backward extension, substantially as and for the purposes hereinbefore described and set forth.

3. The descending and ascending vertical flues extended upward within the rear end of a cooking-stove, such extension being above the horizontal plane of the top plate A, and also above the upper edge of the rear vertical end plate C, and covered over at the upper ends or parts by means of a connecting-plate or molding, B, substantially as and for the purposes hereinbefore described and set forth.

4. The division flue-stripe extending upward into the space formed, in part, by the front of a reservoir, which is against and partly above the upper edge of the rear vertical end plate C, and by an inclined or connecting plate, B, joining the boiler-hole top with the top of the reservoir, to partition off the space so inclosed, and shown in Fig. 3, substantially as hereinbefore described.

5. The pipe-collar for the exit-pipe upon the inclined plate or molding B, which connects the boiler-hole top with the top of the reservoir S, and arranged substantially as shown, so that, where it joins the inclined plate, it shall follow the same line therewith, and open into the space inclosed against the front wall of said reservoir upon an angle, and, between its higher and lower points of union with the molding or connecting plate, shall inclose the escaping heat against the exposed part of the reservoir-front, which is above the upper edge of the rear plate C, or above the horizontal line of the boiler-hole top A, substantially as and for the purposes hereinbefore described and set forth.

6. A cooking-stove having a water-reservoir attached to the rear end of such stove, and a part of such reservoir raised above the horizontal plane of the boiler-hole top A, the reservoir-top and the boiler-hole top connected together at and above the ordinary rear descending and ascending flue, flues, or space, and inclosing a space or spaces, as hot-air chamber or chambers, between the front of said reservoir and the aforesaid connecting-plate or molding, and above the horizontal plane of the boiler-hole top of said stove, substantially as and for the purposes hereinbefore described and set forth.

5,584.—Boat-Detaching Apparatus.—SAMUEL SKIDMORE, Brooklyn, N. Y.—Patent No. 141,470, dated August 5, 1873. Application filed September 16, 1872.

The lever E, by its construction and arrangement through the bifurcated bar B and slotted plate A, has a bearing independent of the pivot F, and should this pivot give way the bolt G would still be held in its position.

Claim.—The frame consisting of the plate A, provided with the slot *a*, the lugs B and B, and the lug C, provided with the opening *c*, in combination with the lever E and bolt G, substantially as and for the purpose specified.

5,585.—Cut-Off and Regulating-Cock for Gas.—CHARLES E. SEAL, Winchester, Va., assignor of one-half interest to EDWIN F. BROOKE.—Patent No. 140,549, dated July 1, 1873. Application filed September 9, 1873.

A valve, which is held to its seat by means of a spiral spring, is operated from any part of a building by a bell-crank lever, to the upper extremity of which is attached a dog, serving to hold the valve at any desired distance from its seat by operating into notches in a ratchet-wheel thereto attached.

Claim.—1. The combination, with a self-closing valve, B, of an operating mechanism for opening and holding the valve, arranged in a room or apartment different from that in which the valve is located, substantially as described.

2. The valve B, having stem *b'*, valve-chamber A, and connecting-rod L, combined with the lever G and ratchet-and-pawl mechanism I H A', as and for the purpose described.

INDEX OF INVENTIONS PATENTED SEPTEMBER 30, 1873.

	Class No.	Whole No.
Alarm, portable burglar, J. Pennepheker	94	143,370
Auger, earth, W. T. Cooley	31	143,278
Axle box, vehicle, O. P. Rice	31	143,330
Baker, folding camp, F. Lehnen	6	143,289
Bale tie, F. Cook	7	143,282
Bale tie, cotton, G. N. Beard	7	143,319
Bale tie, cotton, J. M. Goldsmith	7	143,343
Bed bottom, spring, C. W. Northrup	62	143,373
Bee hive, G. Miller	9	143,295
Bee hive, Sperry and Chandler	9	143,307
Blasting squib, S. H. Daddow	194	143,286
Boat detaching apparatus, S. Sneden, (reissue)	13	5,564
Boats, propelling, A. Beckman	130	143,270
Boilers, composition for preventing incrustations in steam, R. Hatfall	149	143,340
Boot and shoe channeling machine, R. H. Hadley	10	143,327
Boot and shoe tacking machine, D. M. Smyth	16	143,398
Bracelet fastening, R. Roger and Smiley	96	143,382
Bucket, dinner, F. E. Helmig	86	143,341
Buckle, harness trace, H. H. Hartsell	72	143,184
Building, fire-proof, G. H. Johnson	4	143,351
Burner for carburetors, L. W. Shaler	37	143,385
Butter worker, E. E. Scott	45	143,389
Cam movement, J. E. Goodwin	67	143,295
Cane, walking, O. K. Povey	105	143,948
Car coupling, M. Ferrell	120	143,321
Car coupling, Griffith and Miller	120	143,331
Car coupling, D. M. Miller	120	143,396
Car coupling, J. D. Mills	120	143,349
Car, railroad, F. Marin	121	143,369
Car wheel, lubricating, J. H. Murray	126	143,379
Carpet fastener, C. Hartley	69	143,336
Carriage top, concealed jointed brace for, D. W. Baird	31	143,316
Caster, S. Curtis	94	143,324
Chair, reclining, R. C. Ranks	32	143,329
Clamp, sash and door, R. L. Greenlee	30	143,298
Cleek and watch key, P. J. Hoffiger	36	143,305
Clock, programme, S. F. Estell	36	143,320
Clothes wringer, H. J. Burr	31	143,280
Coal scuttle, A. S. Thompson	154	143,311
Comb frame, W. Rassy	9	143,303
Compressor or blower, air, L. Chase	13	143,349
Compressor, wood, H. A. Hemse	174	143,343
Condenser tube fastening, S. Archbold	150	143,314
Corset clasp, F. Lippmann	90	143,359
Coupling and brake, internal spring, Mégy, De Echeverria, and Bazan	97	134,893
Cultivator, J. H. Frank	43	143,326
Cultivator, F. Peres	43	143,309
Drawing roll, H. T. Robbins	142	143,356
Dredging apparatus, E. Stain	98	143,399
Dredging machine dipper handles, fastening the racks of, R. R. Osgood	82	143,947
Drill chuck, L. Parmelee	109	143,377
Drill, rock, D. Kennedy	194	143,355
Earth closet, C. C. Haskins	9	143,339
Eaves trough hanger, T. F. Palm	39	143,375
Edging machine, E. H. Stearns	130	143,964
Engines, crank connection for steam, McGowan and Caldwell	150	143,998
Engines, smoke stack for locomotive, R. Fraser	94	143,330
Engines, valve movement for reciprocating, H. C. Sergeant	122	143,961
Eyelet making machine, Churchill and Robinson	23	143,274
Fabrics, machine for disintegrating, M. Marshall	78	143,990
Faro box, S. H. Little	42	143,360
Faucet, self-closing, McConnell, Truesdell, and Mertsheimer	167	143,981
Fence, portable, H. W. and R. P. Nichols	82	143,372
Fertilizer from offal, J. J. Storer	96	143,310

	Class No.	Whole No.
Fire arm, revolving, R. White	183	143,394
Fire kindler, J. C. Crampton	61	143,277
Fish, preparing and preserving, W. Sharp	38	143,369
Furnace, boiler, C. D. Smith	149	143,365
Furnace, puddling, E. Riley	85	143,301
Gas cut-off and regulating cock, C. E. Seal, (reissue)	64	5,585
Gate, swinging, Gentry and Collett	58	143,363
Grain, &c., apparatus for collecting and transporting, J. and G. Richards	79	143,354
Grain bar, A. F. Crowell	140	143,284
Hammocks, device for suspending, O. Tufts	79	143,399
Harness pad, W. A. Reddick	73	143,353
Harness saddle tree, M. W. Pond	73	143,301
Harvester dropper, J. S. Truxell	74	143,391
Hinge and spring, combined door, W. Gilfillan	24	143,324
Hook, snap, J. C. Covert	93	143,336
Hook, tag, Marston and Phillips	7140	143,364
Horses, apparatus for checking, J. Jackson	31	143,946
Horses, device for detaching, E. R. Jones	73	143,306
Horseshoe, J. B. Johnston	99	143,353
Iron from ore, manufacture of cast, P. E. Jay	85	143,350
Kaleidoscopes, object for, C. G. Bush	157	143,271
Keys, machine for forming spring, M. Doering	93	143,326
Lamp and other posts, clamp for securing advertising boxes to, F. McCosker	146	143,365
Lasting mechanism, L. R. Blake	16	143,322
Lath machine, Brower and Knox	174	143,325
Lathe, wood turning, J. Chase	175	143,281
Lathes, gear cutting attachment to, W. P. Hopkins	100	143,940
Lathes, taper turning attachment to, M. Necker-mann	100	143,396
Loom picker, S. Boorn	95	143,918
Loom picking mechanism, L. E. Ross	95	143,927
Lounge, W. H. Hart	68	143,292
Lubricating compound, S. Y. Love	57	143,348
Marine drag, J. C. Beals	127	143,319
Mattress, life preserving, J. J. Woodine	13	143,313
Meter, gas, Telling and Johnson	64	143,360
Mill, quartz, T. O. Cutler	3	143,326
Mills, feed regulator for grinding, E. H. Austin	59	143,315
Millstone cooling device, J. J. Reth	87	143,959
Mitering machine, J. H. Van Ness	39	143,965
Motion, apparatus for preventing back, A. H. and J. H. Rees	87	143,920
Nail, capped, G. Walsh	103	143,392
Nail separating apparatus, A. Morrison	103	143,946
Oil cup, A. T. Ballentine	57	143,316
Ordnance and projectile therefor, B. C. Pole	105	143,951
Paper bag, L. D. Benner	109	143,281
Paper bag machine, W. Liddell	109	143,359
Pen, marking, D. S. Holman	146	143,347
Pipe coupling, W. B. Dunning	163	143,289
Pipes, coupling for gas and water, J. Holmes	167	143,346
Pipes, &c., machine for cutting and threading, W. D. Chase	100	143,273
Pisten and packing, A. K. Rider	151	143,955
Planing machine, Frank and Spire	173	143,329
Planter, corn, A. F. Smith	133	143,962
Plaster patterns, manufacture of, J. Semple	33	143,334
Plow, W. A. Estes	114	143,279
Plow, S. W. Seale	114	143,363
Plows, subsoil attachment for, E. Cutcliffe	114	143,335
Potato bug destroyer, A. A. Miner	43	143,945
Potatoes, machine for sorting, D. M. King	114	143,357
Press, cotton, T. R. Jackson	7	143,349
Printers' galley rest, Doyle and Murphy	117	143,288
Pump for driven wells, Harrington and Yingling	118	143,345
Purifier, middlings, J. Hollingsworth	57	143,340
Railway gage, L. Kayser	120	143,927
Railway rail joints, elastic seat for, L. Seefeld, Jr.	120	143,394
Railway switch, J. G. Rockwell	120	143,362
Rake, horse hay, B. J. Downing	77	143,978
Refrigerator building, W. S. Bate	30	143,317
Register paint perforating device, W. Overmeyer	117	143,374
Ring, scarf, Mayhew and Leonard	98	143,386
Roof, fire proof, Johnson and Fryer	148	143,352
Saw set, H. S. Castle	131	143,273
Sawing machine, wood, R. F. Click	130	143,330
Screw, wood, O. D. Barrett	171	143,317
Screws, machine for making metal, C. M. Spencer	171	143,366
Separator and scourer, grain, W. P. Clifford	150	143,331
Separator, coal, J. B. Wilford	3	143,395
Separator for coal, ore, &c., H. Bradford	3	143,319
Separators, feeding device for coal and ore, H. Bradford	3	143,322
Sewing machine caster, J. E. Smith	134	143,397
Sewing machine ruffler, C. Schallhas	134	143,959
Sewing machine shuttle, W. H. Schofield	134	143,363
Shank stiffener, W. H. Sprague	16	143,389
Shoe uppers, machine for gumming, P. E. Clark	16	143,275
Sheers, jack for holding, A. K. Washburn	16	143,397
Shutter worker and blind operator combined, D. M. Leonard	94	143,329
Sifter, D. Pierce	154	143,350
Skirt protector, J. C. Livermore	36	143,361
Stove, cooking, G. H. Phillips, (reissue)	154	5,583
Stove pipe shelf, J. F. Beckwith	154	143,389
Straw cutter, A. Kindermann	59	143,356
Telegraph, district and fire alarm, J. H. Gaest	50	143,344
Telegraph, multiplex or interval, M. Gally	50	143,341
Telegraphs, circuit closer and circuit for multiplex or interval, M. Gally	50	143,340
Telegraphs, mechanical key or sounder for, D. L. Parkhurst	50	143,980
Tube, speaking, J. E. Creighton, (reissue)	139	5,580
Tubing, machine for bending, W. T. Farre, (Div. A.) (reissue)	163	5,581
Tubing, method of bending, W. T. Farre, (Div. B.) (reissue)	163	5,582
Twine holder, D. Webber	94	143,396
Umbrella cover, D. W. Odierne	165	143,377
Valve, ball, W. Mendham	154	143,954
Valve for hydraulic cranes, balanced, J. A. Vaughn	79	143,399
Vault, metallic, A. L. Stimson	139	143,369
Vehicle wheel, Chandler and Tainter	31	143,280
Vehicle wheel, J. C. Garretson	31	143,323
Vehicle wheel, P. C. Halsten	31	143,299
Vehicle wheel, I. G. Peck	31	143,376
Wagon brake, J. F. Durbin	31	143,277
Wagon boxes, corner fastening for, J. W. Crandall	31	143,333
Wagons, apparatus for loading and unloading, B. Colly	31	143,332
Wagons, running gear for, G. Phillips	31	143,949
Washing machine, L. H. Davis	91	143,285
Washing machine, G. S. Newsom	91	143,371
Water trough, manufacture of, W. A. Butler	167	143,328
Water trough, mold for casting, W. A. Butler	167	143,327
Water wheel, turbine, J. R. Whiting	168	143,319
Weather strip, J. W. Browne	30	143,306
Weeding implement, garden, W. Jones	141	143,354
Wells, oscillating gland for flowing oil, G. Fintes	134	143,339
Windmill, G. Stearns	118	143,368
Wire, &c., coil holder for, I. E. Palmer	170	143,376
Wire cloth, machine for painting, J. H. De Witt	167	143,327
Wrench, A. D. McMaster	166	143,367

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED SEPTEMBER 30, 1873.

Allen, D. B., assignee	143,257
Archbold, S., Condenser tube fastening	143,314
Austin, E. H., Feed regulator for grinding mills	143,315
Baird, D. W., Concealed joint brace for carriage tops	143,316
Ballentine, A. T., Oil cup	143,316
Baptiste, J., assignee	143,327
Barrett, O. D., Wood screw	143,317
Bate, W. S., Refrigerator building	143,317
Beam, Mary, and De Echeverria	143,288
Bean, E., Dredging apparatus	143,289
Beals, J. C., Marine drag	143,319
Beard, G. M., Cotton bale tie	143,319
Beckwith, J. F., Stove pipe shelf	143,389
Beckman, A., Propelling boats	143,270
Benner, L. D., Paper bag	143,281
Black, F., assignee	143,965
Blake, L. R., Lasting mechanism	143,322
Boorn, S., Loom picker	143,918
Bradford, H., assignee	143,322
Bradford, H., Separator for coal, ore, &c	143,319
Bradford, H., Feeding device for coal and ore separators	143,322
Brooks, R. F., assignee, (reissue)	5,585
Brower, J. W., Weather strip	143,294
Brower, S. P., and W. H. Knox, Lath machine	143,325
Burr, H. J., Clothes wringer	143,280
Bush, C. G., Object for kaleidoscopes	143,271
Butler, W. A., Manufacture of water troughs	143,328
Butler, W. A., Mold for casting water troughs	143,327
Cahoon, C. W., assignee	143,280
Caldwell and McGowan	143,998
Cameron, J. B. C., assignee	143,997
Castle, B. S., Saw set	143,273
Chambers, R., and C., Jr., assignees	143,274
Chandler and Sperry	143,277
Chandler, J. P., and W. Y. Tainter, Vehicle wheel	143,280
Chase, J., Wood turning lathe	143,281
Chase, L., Air compressor or blower	143,349
Chase, W. D., Machine for cutting and threading pipes, &c	143,273
Churchill, H. L., and J. D. Robinson, Eyelet making machine	143,274
Clark, P. E., Machine for gumming shoe uppers	143,275
Clarke, G. H., assignee	143,894
Click, B. F., Wood sawing machine	143,330
Clifford, W. P., Grain separator and scourer	143,331
Cobly, E., Apparatus for loading and unloading wagons	143,332
Colburn, A., assignee	143,998
Collett and Gentry	143,340
Cook, F., Bale tie	143,282
Cooley, W. T., Earth auger	143,278
Covert, J. C., Snap hook	143,336
Crandall, J. W., Corner fastening for wagon boxes	143,333
Creighton, J. E., Speaking tube, (reissue)	5,580
Crowell, A. F., Grain bar	143,284
Crampton, J. C., Fire kindler	143,277
Curtis, S., Caster	143,344
Cutcliffe, E., Subsoil attachment for plows	143,335

Cutler, T. O., Quarts mill 143,336
Daddow, S. H., Blasting squib 143,396
Davis, L. H., Washing machine 143,385
Davis, W. F., assignee 143,394
Deering, M., Machine for forming spring keys 143,386
De Echeverria, Ramon, and Mégy 143,393
De Witt, J. H., Machine for painting wire cloth 143,387
Dennell, J. F., assignee 143,303
Downing, R. J., Horse hay rake 143,378
Doyle, J. A., and J. A. Murphy, Printers' galley rest 143,388
Dunning, W. E., Pipe coupling 143,339
Durbin, J. F., Wagon brake 143,337
Eisaman, C. D. B., assignee 143,261
Enoch, J., assignee 143,257
Estell, S. F., Programme clock 143,330
Estes, W. A., Plow 143,379
Evans, D. L., assignee 143,340
Farre, W. T., Machine for bending tubing, (Div. A.,) (reissue) 5,561
Farre, W. T., Bending tubing, (Div. B.,) (reissue) 5,562
Farren, M., Car coupling 143,331
Furrier, J., assignee 143,330
Flatau, G., Oscillating gland for flowing oil wells 143,380
Frank, A. H., and G. Spire, Planing machine 143,338
Frank, J. H., Cultivator 143,336
Fraser, R., Smoke stack for locomotive engines 143,339
Fryer and Johnson 143,358
Fryer, W. J., Jr., assignee 143,351
Gally, M., Circuit closer and circuit for multiplex or interval telegraphs 143,340
Gally, M., Multiplex or interval telegraph 143,341
Garretson, J. C., Vehicle wheel 143,333
Garrison, L. and J., assignees 143,331
Gentry, J. J., and J. F. Collett, Swinging gate 143,342
Gilfillen, W., Combined door hinge and spring 143,234
Goldsmith, J. M., Cotton bale tie 143,343
Goodwin, J. R., Cam movement 143,335
Goodyear, G., assignee 143,389
Gramlee, R. L., Sash and door clamp 143,236
Griffith, J., and W. F. Miller, Car coupling 143,261
Guest, J. H., District and fire alarm telegraph 143,344
Hadley, B. H., Boot and shoe channeling machine 143,237
Hadrean, P. C., Vehicle wheel 143,262
Hall, O. B., 2d, assignee, (reissue) 5,560
Hamlin, R. D., assignee 143,358
Hampton, I. H., assignee 143,375
Harrington, J. W., and J. Yingling, Pump for driven wells 143,345
Hart, W. H., Lounge 143,263
Harting, C., Carpet fastening 143,238
Hartsell, H. H., Harness trace buckle 143,264
Hashing, C. C., Earth closet 143,239
Hatfull, R., Composition for preventing incrustations in steam boilers 143,240
Heinig, F. E., Dinner bucket 143,241
Hine, M., assignee 143,377
Heard, J. W., assignee 143,271
Hedliger, P. J., Clock and watch key 143,265
Hellingsworth, J., Middlings purifier 143,346
Helman, D. S., Marking pen 143,347
Helman, J., Coupling for gas and water pipes 143,348
Helman, W., assignee 143,333
Hopkins, W. P., Gear cutting attachment to lathes 143,242
Horne, H. A., Wood compressor 143,243
Imperial Meter Company, assignee 143,280
Jackson, J., Horse checking apparatus 143,244
Jackson, T. R., Cotton press 143,349
Jay, P. R., Manufacture of cast iron from ore 143,350
Johnson and Telling 143,280
Johnson, G. H., Fire-proof building 143,351
Johnson, G. H., and W. J. Fryer, Jr., Fire-proof roof 143,352
Johnston, J. B., Horseshoe 143,353
Jones, R. E., Device for detaching horses 143,268
Jones, W., Garden weeding implement 143,354
Kaynor, L., Railway gage 143,267
Kennedy, D., Rock drill 143,355
Kinkaman, A., Straw cutter 143,356
King, D. M., Machine for sorting potatoes 143,357
Knox and Hopper 143,245
Lane, D., assignee 143,269
Lehman, F., Folding camp baker 143,359
Leonard, D. M., Combined shutter worker and blind operator 143,229
Leonard and Mayhew 143,360
Liddell, W., Paper bag machine 143,358
Lippmann, P., Corset clasp 143,359
Little, S. H., Pure box 143,360
Livermore, J. C., Shirt protector 143,361
Love Brothers, assignees 143,362
Love, S. Y., Lubricating compound 143,232
Marin, F., Railroad car 143,363
Marshall, M., Machine for disintegrating fabrics 143,270
Marston, T. P., and H. M. Phillips, Tag hook 143,364
Mayhew, A. P., and I. D. Leonard, Scarf ring 143,366
McConnell, R., W. Truesdell, and F. Marbaheuer, Self-closing faucet attachment 143,231
McCosker, P., Clamp for securing advertising boxes to lamp and other posts 143,365
McGowen, J. H., and D. B. Caldwell, Crank connection for steam engines 143,272
McMaster, A. D., Wrench 143,367
Mégy, L., J. De Echeverria, and F. Ramon, Internal spring coupling and brake 143,229
Mendham, W., Ball valve 143,294
Mertsheimer, McConnell, and Truesdell 143,291
Miller, D. M., Car coupling 143,368
Miller, G., Bee hive 143,295
Miller and Griffith 143,281
Mills, J. D., Car coupling 143,369
Mixer, A. A., Potato bug destroyer 143,245

Amendment to Rules of Practice, dated October 2, 1873, and published in No. 13 of the current volume of OFFICIAL GAZETTE, is hereby revoked.

M. D. LEGGETT,
Commissioner of Patents.

DIGEST OF FOREIGN PATENT LAWS.

GREECE.

REPORT OF MR. WM. A. C. BARRINGTON, OF THE BRITISH LEGATION.

With reference to your lordship's circular of the 14th of August last, I beg to state that there is no special law in Greece affecting inventions. The practice of the country places all inventors on the same footing as a person seeking a monopoly; and in either case a special act is required to secure the individual in the possession of the rights which he claims. A bill for the purpose may be introduced in the chamber by any deputy, and is treated like any other bill; and, if it passes, it defines, according to the circumstances of the case, the limits both as to time and place within which exclusive privileges are accorded to the party on whose behalf the motion is made.

GUATEMALA.

REPORT OF MR. E. CORBETT, OF THE BRITISH LEGATION.

In obedience to the instructions contained in your lordship's despatch of the 14th of August last, I have the honor to inclose such information as I have been able to collect respecting the law and practice of the Republics of Central America with regard to inventions.

I have received no answer from Honduras to my inquiries on this matter, but I do not delay longer sending the reports from the remaining four governments.

Inclosure 1.

[Translation.]

I have the honor to inform you that I have received your favor of the 21st instant, asking me to remit to you information respecting the law and practice of this country respecting inventions.

In reply, I have the honor to inform you that the accompanying law of the month of June, 1864, is the only one existing on this matter.

Inclosure 2.

DECREE.

[Translation.]

The president has seen fit to issue the following decree:

Don Rafael Carrera, president, seeing that there are now pending several petitions respecting exclusive privileges; and that in consequence of the progress of industry, and chiefly of agriculture, it will follow that this class of petitions will continue to increase, and that it is necessary to give due attention to everything that may co-operate with the spirit of enterprise which is displaying itself in these branches; but at the same time considering that fixed rules ought to be established for the concession of such privileges, in order that they may produce good results, in conformance with the council of state, has held it good to decree, and decrees—

ARTICLE I. The author or inventor of an art, manufacture, machine, instrument, preparation of material, or any improvement in them, who may wish to enjoy the exclusive proprietorship of his work or invention, shall present himself to the ministry of interior, making a clear and succinct description of the work or invention, swearing that it is his own discovery, unknown in the country, accompanying this with examples, drawings, or models, according as the nature of the cases

permits, and petitioning for a patent that may accredit his proprietorship.

Art. II. The Minister of Interior will name a commission of one or more experts, in order that the work or invention may be examined, and he will explain to them its originality, they taking a solemn oath in the presence of the petitioning inventor to faithfully discharge their duty, and to guard religiously the secret which he is about to communicate to them during the whole time which this law may order.

Art. III. The originality of the work or invention being established, the president of the republic will concede the exclusive privilege for a term not exceeding ten years, and will command the respective patent to be issued, which will be authorized by his signature, and sealed with the seal of the republic.

Art. IV. This patent will be registered in a book, which will be kept for that purpose in the office of the ministry of the interior.

Art. V. Before issuing the patent to the person soliciting it, he will have to show by the corresponding receipts that he has paid into the public treasury the sum of fifty dollars, and also has deposited in the museum of the "Sociedad Economica" the patterns, drawings, or models, and a paper drawn up to the satisfaction of the examining committee, and authorized by the signature of each one of the members, which paper shall contain a complete description, so minute and specific that it may distinguish the invention or discovery from other things before known and used, and that it may point out the mode and principles by which it may be applied, in order that it may be of use to any other intelligent person that may cause to be made or make use of the same invention, in order that the public may reap the advantages at the end of the term for which the patent was granted. This paper will be closed in presence of the committee, and the title or object of the privilege written on its cover. The proprietor or inventor will affirm that he has strictly fulfilled this duty, and the committee will certify the same. The proprietor, during the term of his privilege, shall be allowed to examine this paper whenever he wishes to do so, in order to see that it remains closed and sealed as he delivered it.

Art. VI. In the museum of the "Sociedad Economica" a "sala" will be set apart for the reception of the patterns, models, or drawings, and a secure safe for the custody of the closed papers mentioned in the former article, which may not be opened or published before the expiration of the term of the privilege or patent, excepting in the cases set forth by Articles XI, XII, and XV.

Art. VII. The fifty dollars, payment of which is established by Article V, shall be applied for the preservation and support of the hall, which is to be established in the museum.

Art. VIII. The introduction of the arts, industries, or machines invented in other countries, and entirely unknown, and neither established or used in Guatemala, shall obtain exclusive privileges on the same terms and with the same conditions as the new discoveries or inventions, but for a shorter period than the latter, which shall not exceed eight years, according to its utility, and the difficulties of the enterprise in the judgment of the minister in view of the report of the committee. Simple variations, or changes of form or proportions of machines, or articles formerly established, shall enjoy no priviledge.

Art. IX. The property in a privilege or patent is transmissible like every other property; but when it is transferred the Minister of the Interior shall be informed of the motives which led to the transfer. If he finds them just, he will make note of them in the book of transfers; and if not, he will proceed to put in force the terms of Article XI. For the transmission of the property of privilege a tax of two per cent. upon the amount paid for the transfer shall be paid, which tax shall be paid into the public treasury.

Art. X. Any person who shall construct privileged articles by the same method as the patent shall pay a fine of not less than $100 or more than $1,000. He shall lose the articles which may be found constructed, and the machines, engines, instruments, or utensils which he has employed in their construction. The whole amount shall be applied, half to the exchequer, half to the proprietor of the patent or privilege, reserving the action for damages and injuries which the latter may have suffered.

Art. XI. The privilege which may have been obtained surreptitiously—that is to say, by false testimony, or the petitioner being other than the inventor, or on account of some industry already established in the country in the same manner—shall immediately be annulled; and the person obtaining it shall be condemned in the costs of the process of the inquiry, and punished by a fine of not more than $1,000 and not less than $100, or with a term of imprisonment not exceeding twelve months or less than three.

Art. XII. If any question should arise among individuals who have obtained privileges for the fabrication of the same products, it shall be decided by an arbitration composed, in the first instance, of a judge named by either party, and of a third named by the Minister of the Interior.

Art. XIII. General privileges may be conceded, which shall take effect in the whole republic, or particular ones, which shall comprise one, two, or more departments.

Art. XIV. In every privilege which may be conceded a proportionate time shall be fixed, which may not exceed two years, for the establishment of machines, engines, or manufactures, the which being concluded the time conceded to the privilege shall begin.

Art. XV. If by the end of the time conceded for the establishment it has not been begun the privilege will not hold good; and it will be forfeited if after commencement it is abandoned for more than a year, or if the products are adulterated, proving inferior to the models or paterns presented.

Art. XVI. It will only be possible to renew a patent when fortuitous circumstances, or extraordinary occurrences, may make the privileged person worthy of it, (the renewal,) and it must be solicited at least six months before the expiration of the privilege.

Art. XVII. The Minister of Interior is charged with the execution of this present decree, of the which he will give account in the chambers at its next session.

Inclosure 3.

SAN SALVADOR.

[Translation.]

I have had the honor to receive your favor of 21st ultimo, in which you seek information from this office respecting the laws with reference to inventions.

In conformance with your desires, I inform you that our constitution gives power to the executive to award and concede privileges to the authors of useful inventions; but that this faculty is not arranged as it should be by a secondary law; and that in the few cases which have occurred the spirit of this constitutional disposition has been followed in accordance with the practice of civilized governments.

Inclosure 4.

SAN JOSÉ.

[Translation.]

In answer to your favor of the 21st ultimo, I have the honor to inform you that the twentieth division of the article of constitution states that it belongs to congress to promote the progress of the arts and sciences, and to secure, for a limited time, to authors or inventors the exclusive right of their writings or discoveries.

According to this, every one that believes himself to have a right to a patent of invention must solicit it from the constitutional congress.

Inclosure 5.

MANAGUA.

[Translation.]

I have had the honor to receive your favor, dated 21st ultimo, in which you seek information for your government respecting the laws and practice of Nicaragua relative to inventions.

The Spanish cortes, whose resolutions obtained until the 15th of September, 1821, and as far as they are not in opposition to those of these countries have been declared in force in this republic, assure and regulate the right of property of inventors, establishing also the term of its duration.

Decree forty-three declares as to this right—to consider as proprietor of his work him who should invent, import, or introduce.

The government, by means of the proper minister, will issue to the said proprietor a certificate, in which will appear his name as inventor, improver, or introducer of the work, a description of it, (the invention,) and the duration of the exclusive right. This certificate will serve as a sufficient title; but in order to obtain it, it is necessary that the petitioner should address himself to the prefect of the department or to the municipality, giving an account of his work, describing it with the greatest exactness possible in conformity with the model, which the same law establishes.

The said authorities, in their turn, shall be obliged to give to the petitioner testimony of everything which may serve for the information of the minister of the department.

The inventor shall have ten years of exclusive property, the improver seven, and the introducer five. These terms may be extended by the sovereign power, on the proposition of the government, to fifteen, ten, and seven years, respectively.

The inventor, improver, and introducer, apart from the aforesaid terms, will cease to be considered as sole proprietors, first, if they cede their right for the public good; secondly, if they let six months pass without taking up the certificate; thirdly, if they let two years pass without putting in execution their invention, perfection, or improvement.

This is, in substance, that which is decreed by the Spanish cortes.

In this republic nothing new has been arranged with respect to this matter.

The state of continual agitation, in which this country has been involved since its political emancipation, has not permitted the complete reform of its codes.

But our constitution has given to congress the faculty of promising rewards and privileges to the inventors and managers of useful works, as will be seen by its Article XLII, division twenty-two; and, in practice, the rules of the decree cited above are not followed.

He who wishes for a reward or privilege seeks it from congress, who concedes it, if it sees fit to do so.

In this manner I have the honor to give to you the information solicited, having the pleasure, &c.

HAYTI.

Report of Mr. S. St. John, of the British Legation.

I have the honor to acknowledge the receipt of the circular of August 14, 1872, respecting the law and practice of foreign countries with regard to inventions.

On inquiry I find that the Republic of Hayti has no law or practice on the subject, having never yet had occasion to apply either. Should it ever feel the want of such a law it would probably base its legislation on the French system.

NETHERLANDS.

Report of Mr. J. Walsham, of the British Legation.

On the 25th of January, 1817, an act was passed for conferring exclusive privileges on inventions and improvements of articles of art and industry, and remained in force up to 1869.

On the 21st of June of that year, a project of law was submitted to the second chamber of the States-General, having for its object the repeal of the act of 1817, and the complete abolition of all patents.

It was worded as follows:

Art. I. From and after the 1st of January, 1870, no fresh patents for inventions and improvements, or for the first introduction of objects of art and industry, shall be granted, except in the cases of applications that shall have been made prior to that date.

Art. II. Patents formerly conferred, or to be conferred, by virtue of Art. I of this act, may be extended in accordance with the law of 25th of January, 1817.

After an interesting debate, in which the supporters of the patent laws endeavored to prove that invention conferred a right of property, and should therefore be protected, the project passed the chamber by a majority of 49 to 8 votes, one amendment having been proposed and carried, namely, to insert in the first article the words, "after the day of the publication of the law," instead of "after the 1st of January, 1870."

With this modification the law went up to the first chamber, was passed there, and after receiving the royal assent on the 15th of July, 1869, was published on the 19th of the same month.

Consequently, from this latter date no fresh patents could be conferred, except in the case of applications

made and acceded to prior thereto; at the same time these special patents, as well as those which had been granted under the old act of 1817, and had not yet expired, could be extended in accordance with the provisions of this same act of 1817.

It will be necessary to say a few words on the subject of these provisions, and to refer to the regulations for carrying out the act itself, and annexed thereto, which received the sanction of the Crown on the 26th of March, 1817; but before doing so it may be as well to correct a somewhat prevalent idea that the Crown, notwithstanding the law for the abolition of patents, has still the power in special cases of conferring exclusive rights upon inventors.

No such royal prerogative, however, exists; and no exceptions whatever are or can be made, beyond those specified in Arts. I and II of the abolition law.

According to the act of 1817, a patent can be granted for five, ten, or fifteen years; and those patents which are conferred for either of the first two periods can be extended, but only up to fifteen years. Therefore, by the first article of the law of July 15, 1867, patents, the application for which had been made and approved before the law came into operation, can, from the 19th of the same month (the date of its publication,) be granted for a term of five, ten, or fifteen years; and by the second article of the same law, these particular patents—if conferred for five or ten years, as well as those granted previously to the publication of the abolition law, if the latter were not originally granted for the full term of fifteen years—can be extended to that period.

Now, by the "Regulations" for carrying out the patent act of 1817, all proprietors of patents who, by new inventions, improve the articles patented, may obtain a new patent for such inventions and improvements, either for the period of their original patents, or for one of the periods assigned in the act itself, viz., five, ten, or fifteen years; and at first sight it might be supposed that the two classes of patentees alluded to in the first and second articles of the abolition law of 1869, as still coming within the application of the old patent act of 1817, and therefore within that of the "Regulations," which form an integral part of the act, would not even at the present day be debarred from enjoying the privilege first mentioned with regard to improvements on the inventions for which the original patent was granted. But this is not the case, as such privilege would necessitate the issue of a new patent; and the law of 1869 expressly prohibits such issue beyond the limits assigned in its two articles.

A translation, *in extenso*, of the act of 1817, and of the regulations for carrying out its provisions, accompanies this memorandum, in case they may be required for reference.

ANNEXE.

Netherland "Patent Act" of 1817.

[TRANSLATION.]

Act passed on the 25th January, 1817, for conferring exclusive rights on inventions and improvements of articles of art and industry.

We, William, &c., with greeting, to all persons who shall see or hear these presents, hereby make known:

That having taken into consideration the advantage of making general rules for conferring exclusive rights on inventions and improvements of articles of art and industry;

We, therefore, after having consulted the council of state, and deliberated with the States General, have approved and directed as follows:

ART. I. We will continue to confer, within the Kingdom, on any inventions or actual improvements in any branch of art and industry as well as on the first introduction or bringing into operation of inventions or improvements, exclusive rights for a definite period, by public license, under the name of patents, after due examination.

ART. II. These patents shall be conferred without prejudice to any one's rights or possession, and therefore shall not be valid whenever it shall appear that the invention or improvement constituting the subject of any patent has been used or employed or been brought into operation within the Kingdom before the conferring of such patent.

ART. III. The patents shall be conferred for the period of five, ten, or fifteen years, and, in proportion to the time and importance of the invention or improvement, lower or higher charges shall be made, which shall, however, never exceed the sum of 750 g., [$307.50,] nor less than 150 g., [$65.50.]

ART. IV. A patent conferred for five or ten years, on the expiration of that period may be prolonged, in cases when very weighty reasons can be given, but it may not be extended to a longer period than fifteen years altogether.

ART. V. Patents, on the first introduction or bringing into operation of inventions or improvements, made or brought into operation in foreign countries, so far as they are patented in those countries, shall not be conferred for any longer time than that for which an exclusive right shall have been granted in such foreign country, and under the express condition that the patented articles shall be manufactured within the Kingdom.

ART. VI. The patents shall confer on their owners or possessors the right and privilege:

(*a*) Of exclusively manufacturing and selling within the Kingdom, during the period prescribed, the patented articles, or of causing them to be manufactured and sold with their permission.

(*b*) Of prosecuting at law and proceeding against such persons as shall infringe the exclusive right conferred on them, in order to the confiscation to their own profit and advantage of what is manufactured and still unsold, to recovery of the amount for which the patented articles have been already sold, as well as such further compensation for injury, loss of profit or advantage, for which a claim may be established.

ART. VII. In applying for any patent the applicant is bound to annex an exact and explicit description of the subject of the secret constituting the object of the patent, signed with his own hand and sealed, comprehending the requisite plans, drawings, &c., and this description, at the expiration of the period of the original or extended patent, or if it shall have lapsed earlier, for reasons hereafter to be assigned, shall be made public, unless the government for weighty reasons should determine on postponing this publication.

ART. VIII. A patent shall be declared forfeited for the following reasons:

(*a*) Whenever it shall appear that the patentee, in the description appended by him to his application, has dishonestly omitted to mention or falsely represented any portion of the subject of the patent.

(*b*) Whenever it shall appear that the subject of the patent has been already described in print before the patent was issued.

(*c*) Whenever the patentee shall have made no use of his patent for the space of two years after his patent was signed, unless for weighty reasons, to be left to the decision of the government.

(*d*) Whenever the patentee, after having secured his patent, shall have obtained another patent in another country for the same object.

(*e*) Whenever it shall appear that the object patented, in its nature or application, is dangerous to the safety and security of the Kingdom or its inhabitants.

ART. IX. A separate account shall be kept of the fees paid for patents, and the amount shall be applied to the encouragement of art and industry, by awarding premiums, gratifications, &c.

ART. X. The laws and ordinances relating to patents, and such like exclusive rights on inventions and improvements up to the present time in operation, are by this act repealed and set aside; the patents, &c., however, hitherto issued and conferred for inventions shall remain in force for the benefit of their rightful owners in their original extent.

We command and direct that this shall be printed in the gazette, ("Staatsblad,") and that ministerial departments and authorities, corporations and servants of the government, shall co-operate to the exact execution of the same.

Given at Brussels on this 25th January, in the year 1817, the third year of our reign.

(Signed) WILLIAM.

By order of the King.

A. R. FALCK.

Regulations for carrying out the act of January 25, 1817, *on the conferring of patents for inventions, improvements, &c.*

ARTICLE I. In order to obtain any patent the applicant is bound to present a petition on the subject to the King, to be deposited with the clerk (greffier) of the states of his province. This petition shall contain a general account of his application, his surname, christian name, and address, as well as the period for which he desires to acquire a patent, and for which the same object has been already patented abroad. Finally, he shall append a sealed, exact, and complete description, signed by himself, of the subject or secret of the patent, accompanied by the plans and drawings belonging to it, in accordance with Article VII of the act of 25th January, 1817.

ART. II. The clerk (greffier) of the provincial states shall make a memorandum (procès-verbal) on the outside of the packet (model No. 1) of the delivery of the petition and the accompanying documents, and the exact date of this delivery. This memorandum (procès-verbal) shall be signed by him and by the applicant, and a duplicate of it shall be given to the latter.

ART. III. The governor of the province shall, without delay, and at the outside within ten days of the delivery of the petition, forward all petitions for patents to the Commissary-General for Instruction, Arts, and Sciences.

ART. IV. The Commissary-General shall present these petitions with his opinions thereon to the King, and on the supposition that the application falls within the terms prescribed, he shall submit with his report the patent for His Majesty's signature.

ART. V. In case the King should think good to reject the application, or to take the opinion thereupon of the Royal Netherlands Institution at Amsterdam, or of the Royal Academy of Science and Literature at Brussels, notice thereof shall be given to the applicant.

ART. VI. The patent (model No. 2) shall contain the description of the subject or invention, and indicate the rights and privileges which it confers on the possessor in accordance with Article VI of the act of 25th January, 1817. It shall, in addition, contain the express condition or stipulation that the government, in granting such patent, in no way guarantees the excellence or value of the invention, and reserves to itself the right of declaring it forfeited for one of the reasons assigned in Article VIII of the act in question. A patent for the first introduction of an article already patented in a foreign country shall besides expressly mention that the Government does not guarantee the truth of the declaration by the petitioner or applicant with respect to the duration of the foreign patent, as well as that the patented articles shall be manufactured within the Kingdom, in accordance with the condition or stipulation of Article V of the act.

ART. VII. Whenever a patentee wishes to obtain an extension of a patent conferred for five or ten years, he is bound to present his application in writing to the Commissary-General for Instruction, Arts, and Sciences, who thereupon shall make a report to the King. The patent so extended shall also be signed by the King.

ART. VIII. All proprietors of patents who, by new inventions, improve the articles patented, may obtain a new patent for such inventions and improvements, either for the period of their original patent, or for one of the periods assigned in Article III of the act.

ART. IX. In acquiring such a patent the same conditions shall be observed as in the applications for other patents. The fees to be paid for such patents shall be regulated in proportion to the time during which the patent is to be enjoyed, and in apportioning these charges attention must at the same time be paid to the importance of the improvement introduced.

ART. X. Whenever any one professes to have discovered an improvement in an article for which a patent has already been granted, he shall be allowed to obtain a patent for separately bringing such improvement into operation, without on any pretence being empowered to manufacture or produce the article itself for which the former patent was granted, so long as this former or previous patent shall not have ceased to be in force. In like manner the first inventor shall not be suffered to bring into operation the improvement patented at a later period. Changes in shape, forms, &c., or proportion, or additional ornamentation, of any description whatsoever, shall not be considered as included in such improvements.

ART. XI. Possessors of patents wishing to make over in whole or in part their rights for the benefit of others, are bound to ask the King's approval beforehand. They are obliged on penalty of invalidity to get this transfer registered at the office of the greffier (greffe,) where a report (procès-verbal) of it shall be drawn up, in accordance with the model under No. 3, which shall be transmitted without delay to the Commissary-General for Instruction, Arts, and Sciences. This procès-verbal or report shall be entered in the register hereafter to be mentioned.

ART. XII. All persons succeeding to the rights of a patentee in consequence of his death, are bound, before making use of their rights, to make a declaration of them at the proper office (greffe) in the province, where a report of it shall be drawn up, in accordance with the model under No. 4, which shall be transmitted without delay to the Commissary-General for Instruction, Arts, and Sciences. This report or procès-verbal shall be entered in the register hereinafter to be mentioned.

ART. XIII. On the expiration of any patent, or whenever it shall have been declared forfeited in accordance with one of the reasons assigned in Article VIII of the law, the Commissary-General for Instruction, Arts, and Sciences shall take the necessary measures to make public the inventions and improvements for which the patent was conferred.

ART. XIV. Whenever, on the expiration of a patent, or on the declaration that it has been forfeited for one of the reasons assigned in Article VIII, the Commissary-General for Instruction, Arts, and Sciences shall deem it undesirable to make the invention public, for political or commercial considerations, he shall in such a case draw up a report to the King, so as to submit the matter to the decision of His Majesty.

ART. XV. The Commissary-General for Instruction, Arts, and Sciences shall forward the patents, after they have been granted and signed by the King, to the governor of the province where the applicant resides, and at the same time indicate the amount to be paid for fees. The governor shall hand over the patent to the applicant in question, when the latter shall have given proof that he has paid the required fees to the provincial paymaster or receiver.

ART. XVI. The fees to be paid for patents shall be as follows:

For a patent for five years, 150 guilders=$65.50.

For a patent for ten years, 300=$131; or 400 guilders=$164, in proportion to the importance of the invention or improvement.

For a patent for fifteen years, 600 guilders=$246; or 750 guilders=$307.50, in proportion to the importance of the invention or improvement.

On transferring or inheriting a patent, 9 guilders=$3.69.

ART. XVII. Whenever a patent shall have been declared forfeited for one of the reasons mentioned under letter (c) of Article VIII of the act of January 25, 1817, the fees which have been paid for it shall be returned, in whole or in part, according to the time yet to run before the expiration of the patent.

ART. XVIII. The Minister of Finance shall every year send in an account to the Commissary-General for Instruction, Arts, and Sciences, containing an exact return of the sums paid in fees for patents. The Commissary-General shall make the necessary report to His Majesty, so that these sums may be applied to the purposes determined on in Article IX of the law of January 25.

ART. XIX. A register shall be kept by the Commissary-General for Instruction, Arts, and Sciences, in which the patents granted, transferred, or inherited, shall be registered. All applicants for a patent shall always be allowed to inspect this register beforehand.

ART. XX. Patents granted and the names of the patentees shall be published in the official papers.

MODEL NO. 1.

Model of a report (procès-verbal) of the presentation of a petition for a patent on inventions, first introduction, or improvements.

Province of this day the of the month 18 at o'clock, Mr. has placed in our hands the present packet, sealed with his own seal, which he declares to us to contain a full description of (describing the subject) for which he applies for a patent for the period of five, ten, or fifteen years, according as it is set down in the petition annexed.

And the same Mr. has declared to us that he is the inventor, improver, or introducer of the article above mentioned.

Given at the office (greffe) of the province the

MODEL NO. 2.

Model of a patent on the invention, introduction, or improvement of any article.

We, William, by the Grace of God King of the Netherlands, Prince of Orange-Nassau, Grand Duke of Luxembourg, &c.

In reference to the petition of residing in which he applies in accordance with the act of January 25, 1817, for a patent for the term of years, for the invention, improvement, or introduction of [description of the article] of which he has declared himself to be the inventor, (or introducer,) as it appears from the report (procès-verbal) drawn up on the presentation of his papers, at the office (greffe) of the province the

In reference to the drawings and description, whereof the contents are as follows:

Have sanctioned and approved the granting to the applicant, as granted by the present decree, a patent on the invention for years, for [description of the invention].

This patent shall confer on its possessor or legal owner the right:

(a) All over the Kingdom, during the time specified, exclusively and alone to manufacture and sell the patented articles, or to cause to be manufactured and sold with his permission.

(b) To sue at law and proceed against all persons who shall infringe the patent, for the purpose of procuring the forfeiture to his own benefit of the manufactured and yet unsold articles, and of the amount received for the already sold patented articles, as well as for such farther compensation for injury, loss of profit or interest, to which claim can be made.

Without in any sense guaranteeing the excellence or value of the invention (or in granting a patent on the introduction of any article, the truth of the representation of applicants, with reference to the period of a foreign patent.)

And this patent shall by us be declared forfeited, for one of the reasons mentioned in the act of January 25, 1817, Article VIII.

(To a patent for the introduction of any article is to be appended, that the patented articles must be manufactured within the Kingdom.)

Given at

MODEL NO. 3.

Model of a certificate on the transfer of a patent.

This day the of the month, 181 Mr. presented himself at our office to draw up a report (procès-verbal) of the entire or partial transfer by him executed in favor of Mr. of the patent granted to him on the with notarial certificate.

The present report (procès-verbal) is signed by the parties concerned and by ourselves, after payment of the fees, according to the scale appointed by the regulation for issuing patents.

Given at the office of the province of the

MODEL NO. 4.

Model of a certificate on obtaining a patent by bequest or inheritance.

This day the of the month, 181 Mr. presented himself at our office to draw up a report (procès-verbal) of his having acquired by right of succession, in whole or in part, as it appears in a certificate of the notary, a patent on which was granted on to Mr. deceased.

And this report (procès-verbal) is signed by the parties concerned and by ourselves, after payment of the fees, according to the scale appointed in the regulation for issuing patents.

Given at the office of the province of 181 on the

The above regulation with the models approved and decreed by the King on the 26th March, 1817.

Authorized by me,

The Secretary of State.

COMMISSIONER'S DECISIONS.

T. N. FOSTER.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of T. N. Foster for reissue of patent No. 30,215, granted October 2, 1860, for* HARVESTER.—*Decided October 4, 1873.*]

An invention approved, which consisted of a new combination of old devices.

A mere consideration of the steps taken to produce inventions tends to belittle them, and often misleads the judgment.

All there is of any invention, so far as its embodiment is concerned, is the new shaping or arranging of matter.

While it is well to examine the steps in the light of the state of the art by which an invention has been arrived at, a consideration of the results accomplished by the invention, as compared with what were before accomplished by complete individual devices of the same class, is more important, and is less likely to mislead the judgment in determining whether or not an invention has been made.

LEGGETT, *Commissioner:*

The claim under consideration is as follows:

The combination of the tongue-frame, vibrating on the main axle, and having the tongue rigidly connected thereto, the independently-vibrating cutter-frame, and the flexible draft-connection between said cutter-frame and the whiffletrees, substantially as described.

The reference cited is the patent of S. E. and M. P. Jackson, granted December 29, 1857, and reissued May 25, 1869. This patent lacks one element of the claim, viz., "the independently-vibrating cutter-frame." The cutter-frame in Jackson's machine is rigidly attached to the tongue-frame, so that it cannot be lifted without at the same time lifting the tongue-frame and the driving-wheel, which would stop the vibrations of the cutter-bar and the operations of the machine.

The draft-chains are similarly attached in both machines, it is true; but the argument of the Board that in Jackson's the chain could have been applied "for no other purpose except that of raising the cutting apparatus" is palpably erroneous, because in just so far as it tends to raise the cutting apparatus it also tends to raise the driving-wheel and prevent it from operating the cutter-bar. The result of the lifting tendency in Jackson's machine is injurious, so far as it goes, while in applicant's it is beneficial, because the cutter-frame is pivoted, and may be raised independently without disturbing the working of the machine. Applicant's chain serves an additional purpose beyond that of Jackson's. It obviates the side draft as Jackson's does, and it also elevates the cutter-frame. The combination claimed appears to be operative, novel, and useful; and I see no reason why it should not be allowed. A consideration of the steps taken to produce a device, rather than a consideration of the complete device itself and its comparison as a whole with other complete devices of the same class, tends to belittle inventions, and often misleads the judgment. I think such a course of reasoning has misled the Examiner (on whom the Board seem greatly to have relied) in this case. He says: "The type of machine was old, and the independent under draft was old. Applicant has simply transferred the draft-connection from one existing machine to another. * * * He communicated nothing new to the public, and is not entitled to a monopoly of the under draft in this popular class of machines." Now, what applicant communicated to the public (by

whatever apparently easy steps, in view of the state of the art) was the new combination of parts he has claimed, out of which, and out of which only, so far as appears, the results he specifies spring. The invention is not great perhaps, but it is all in quality that ever results from a new combination of old devices. All there is of invention in any case, so far as its embodiment is concerned, is the new shaping or arranging of matter. While it is well to examine the steps in the light of the state of the art by which an invention has been arrived at, a consideration of the results accomplished by an invention, as compared with what were before accomplished by complete individual devices of the same class, is more important, and is less likely to mislead the judgment in determining whether or not an invention has been made.

The decision of the Board of Examiners-in-Chief is reversed.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,599.—Defecating and Clarifying Cane-Juice.—Granted to RICHARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 3, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,028.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 28, 1873.

26,030.—Manufacture of Gas.—Granted to LEONARD D. GALE, November 8, 1859; reissued March 8, 1870. Application filed August 7, 1873. Testimony closes October 7, 1873. Hearing October 28, 1873.

26,060.—Machines for Making Box-Joints.—Granted to JAMES STEPHENS, November 8, 1859. Application filed August 2, 1873. Testimony closes October 7, 1873. Hearing October 28, 1873.

26,068.—Sleeping-Cars.—Granted to JOHN DANNER, November 8, 1859. Application filed August 4, 1873. Testimony closes October 7, 1873. Hearing October 28, 1873.

26,087.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,096.—Machines for Folding Paper.—Granted to CYRUS CHAMBERS, Jr., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,097.—Electro-Magnetic Telegraphs.—Granted to MOSES G. FARMER, November 15, 1859; and reissued December 10, 1872. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,126.—Billiard-Table Cushions.—Granted to GEORGE D. SHARP, November 15, 1859; and reissued April 8, 1873. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,135.—Portable Pumps.—Granted to WILLIAM T. VARE, November 15, 1859; reissued February 28, 1861. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,136.—Mode of Advertising.—Granted to EDWARD WIRES, November 15, 1859. Application filed August 18, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,139.—Pumps.—Granted to WILLIAM WRIGHT, November 15, 1859. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,147.—Machine for Bundling Kindling-Wood.—Granted to WILLIAM L. WILLIAMS, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

26,177.—Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,178.—Making Rubber Belting.—Granted to DENNIS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,202.—Manufacture of Paper-Pulp.—Granted to JOHN B. PALMER and GARDINER HOWLAND, November 22, 1859; and reissued July 2, 1867. Application filed August 20, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,243.—Water-Closet Basins.—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,244.—Machines for Registering Music.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 29, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,262.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. FERRY, November 29, 1859. Application filed August 30, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,321.—Molding for Metal Casting.—Granted to JOHN P. BROADMEADOW, November 29, 1859. Application filed August 15, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,327.—Nursing-Bottles.—Granted to FRANCIS J. LA FORME, November 29, 1859, and reissued January 14, 1868. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,329.—Boot and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 28, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,339.—Water-Wheels.—Granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1860, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,401.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 22, 1860. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,408.—Composition for Kindling Fire.—Granted to ELIZABETH BELLINGER, December 13, 1859, and reissued August 7, 1866. Application filed September 15, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,410.—Seed-Planters.—Granted to WILLIAM BLESSING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,454.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, Jr., December 13, 1859, and reissued April 3, 1860. Application filed September 13, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,475.—Breech-Loading Fire-Arms.—Granted to BETHEL BURTON, December 20, 1859, and reissued December 21, 1869. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,486.—Pipe-Molding.—Granted to JOHN FENTH and JOHN INGHAM, December 20, 1859, and reissued April 26, 1869. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,487.—Screw-Taps.—Granted to WILLIAM and ROBERT FOSTER, December 20, 1859. Application filed September 18, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Trap.—Granted to JAMES A. LOWE, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,513.—Nail-Plate Feeder.—Granted to JOHN NEWELL, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KIMBALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,582.—Harvesters.—Granted to JOHN GOBB, December 27, 1859, and reissued January 15, 1861. Application filed September 29, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to JONATHAN P. GROSVENOR, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to SAMUEL LEGGO, December 27, 1859. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Porous Ware.—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, December 27, 1859. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to BENJAMIN F. STUNTEVANT, December 27, 1859. Application filed September 25, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,674.—Clothes-Driers.—Granted to B. B. HAWES, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to FRANCIS C. LOWTHROP, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,808.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 20, 1869. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,832.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 22, 1873. Hearing January 7, 1874.

27,005.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,456.—Machines for Covering the Springs of Elastic Skirts.—Granted to JOHN T. LOVE, March 13, 1860. Application filed October 6, 1873. Testimony closes February 16, 1874. Hearing February 25, 1874.

31,963.—Fare-Boxes.—Granted to JOHN R. BRAYMER, January 29, 1861. Patented in England January 14, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

25,726.—Improved Hand-Machine for Wiring Blind-Rods, granted to ESRAM C. DAVIS, October 11, 1859.

Claim.—1. The setting-form A, which sets over the rod C and straddles the slats D, and which is secured under the blind by means of the stationary bar B, in such manner as to let the staples through the eye of the staple in the rod C, into the slats D D, being the equivalent means employed for setting the staple in the rod C, in combination with the adjustable arrangement E, operating substantially as described.

2. In combination with the form A, the joint-lever G, flange-rod or driver H, dividing-slide I, inclined needle-bar J, the whole being arranged substantially as described, and for the purpose set forth.

25,733.—Improvement in Double-Friction Couplings, granted to JOSHUA HENDY, October 11, 1859; reissued March 25, 1873, numbered 5,335.

Claim.—1. The application of two such truncated cones to one coupling, one at either end, and operated by a single lever, so as to work in cavities or conical sleeves attached to pulleys or wheels arranged on one shaft, so that said shaft may be run slow or fast, or backward or forward, or entirely stopped, without stopping the prime motor or changing its speed, substantially as herein set forth and explained.

2. The lever E, in combination with the double-acting friction device, substantially as set forth.

25,747.—Improvement in Method of Combining Emery with Caoutchouc, granted to THOMAS J. MAYALL, October 11, 1859.

Claim.—A process of making emery sharpening and polishing tools by combining emery with india-rubber, gutta-percha, or other substances, and then submitting the same, while under great pressure, to a high degree of artificial heat, substantially as set forth, whereby, with a given quantity of rubber, emery may be combined in much greater quantities than it could be heretofore done.

25,767.—Improvement in Cutting and Panning Cakes, granted to JOHN H. SHROTS, October 11, 1859, (MARY SHROTS, executrix.)

Claim.—The cutter A, as constructed, or its equivalent, in combination with the pan E and bottom-board D, for the purpose of facilitating the cutting and removing the cakes to the oven, as set forth and described.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date October 7, 1873.]

6,900.—Carpet.—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.—B. Application filed September 24, 1873. Term of patent 3½ years.

6,901.—Carpet.—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.—U. Application filed September 24, 1873. Term of patent 3½ years.

6,926.—Carpets.—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.—A. Application filed September 24, 1873. Term of patent 3½ years.

6,927.—Carpet.—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.—W. Application filed September 24, 1873. Term of patent 3½ years.

6,928.—Carpet.—ROBERT R. CAMPBELL, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.—T. Application filed September 24, 1873. Term of patent 3½ years.

6,929.—Carpets.—OTTO HEINICKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,930.—Carpets.—OTTO HEINICKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,931.—Carpets.—OTTO HEINICKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,932.—Carpets.—OTTO HEINICKE, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,933.—Lathe-Dog.—BENJAMIN L. LATHROP, New Haven, Conn., assignor to himself and JOSEPH DANIELS, same place. Application filed September 5, 1873. Term of patent 14 years.

6,934.—Carpets.—LEVI G. MALKIN, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,935.—Frame for Machines.—JOHN M. MARSTON, Boston Mass. Application filed January 6, 1873. Term of patent 3½ years.

6,936.—Carpet.—DAVID MCNAIR, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.—Z. Application filed September 24, 1873. Term of patent 3½ years.

6,937.—Carpet.—DAVID MCNEIR, Lowell, Mass., assignor to LOWELL MANUFACTURING COMPANY, same place.—V. Application filed September 24, 1873. Term of patent 3½ years.

6,938.—Carpets.—ELMER J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,939.—Carpets.—ELMER J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,940.—Carpets.—ELMER J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,941.—Carpets.—ELMER J. NEY, New York, N. Y., assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,942.—Carpets.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,943.—Carpets.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,944.—Carpets.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,945.—Carpets.—JOHN H. SMITH, Enfield, assignor to HARTFORD CARPET COMPANY, Hartford, Conn. Application filed September 26, 1873. Term of patent 3½ years.

6,946.—Toy Bank.—THOMAS SWAIN, Philadelphia, Pa. Application filed September 16, 1873. Term of patent 7 years.

6,947.—Buttons for Wearing Apparel.—JONATHAN E. WHEELER, Westport, Conn. Application filed July 30, 1873. Term of patent 14 years.

6,948.—Lazy-Foot.—THOMAS B. ATTERBURY and JAMES S. ATTERBURY, Pittsburg, Pa. Application filed September 19, 1873. Term of patent 7 years.

6,949.—Butt-Hinges.—MILTON BRADLEY, Springfield, Mass., assignor to THE UNION MANUFACTURING COMPANY, New Britain, Conn. Application filed September 24, 1873. Term of patent 7 years.

6,950.—Carpet.—HERMICH F. GOETZE, Boston, Mass., assignor to THE ROXBURY CARPET COMPANY, same place. Application filed September 17, 1873. Term of patent 3½ years.

6,951.—Floor Oil-Cloths, &c.—CHARLES T. METER and VICTOR E. METER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed September 24, 1873. Term of patent 3½ years.

6,952.—Hats.—JOHN S. FATHERWEATHER, Bridgefield, Conn. Application filed September 12, 1873. Term of patent 3½ years.

6,953.—Sword-Hilt and Scabbard.—VIRGIL PRICE, New York, N. Y. Application filed September 22, 1873. Term of patent 14 years.

6,954.—Printing-Types.—EDWIN C. RUTHVEN, Philadelphia, Pa., assignor to DAVID WOLFE BRUCE, New York, N. Y. Application filed April 21, 1873. Term of patent 14 years.

6,955.—Advertising-Frames.—CHARLES H. SHACKFORD and MARTIN V. CAMPBELL, Syracuse, N. Y. Application filed September 15, 1873. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date October 7, 1873.]

1,481.—Gin.—JOHN W. CULBERT, New York, N. Y. Application filed September 27, 1873.
"'I. B. H.'"

1,482.—Iron and Steel.—LENG & OGDEN, New York, N. Y. Application filed September 24, 1873.
"'Credenda.'"

1,483.—Distilled Liquors.—M. M. SMITH & BROTHER, Chicago, Ill. Application filed September 17, 1873.
"the monogram 'S. T. D.'"

1,484.—Distilled Liquors.—M. M. SMITH & BROTHER, Chicago, Ill. Application filed September 17, 1873.
"'Silver Tide.'"

1,485.—Distilled Liquors.—M. M. SMITH & BROTHER, Chicago, Ill. Application filed September 17, 1873.
"'Silk Finish.'"

1,486.—Distilled Liquors.—M. M. SMITH & BROTHER, Chicago, Ill. Application filed September 17, 1873.
"monogram of the letters 'M. M. S. & B.'"

1,487.—Soap.—WILLIAM L. TROXELL, Brooklyn, N. Y. Application filed September 24, 1873.
"the words 'Pride of the Kitchen' and a picture of a monkey seated on an inverted pan."

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date October 7, 1873.]

ORIGINAL PATENTS.

143,397.—Spring Bed-Bottom.—CHARLES L. AMES and ABEL H. FROST, Chicago, Ill. Application filed August 12, 1873.

Spiral springs at the corners of a bed-bottom, extending from the side supports of the bottom to the head and foot supports of the slats above, keep the whole tight and prevent sagging, when under pressure.

Claim.—The braces D, provided with the pivoted ends G and coil-springs F, in combination with the upper and lower sections A A′ C B′ of a two-part bed-bottom, as and for the purpose set forth.

143,398.—Leather-Skiving Machine.—GEORGE ANDREWS, Oxford, Me. Application filed June 27, 1873.

Adjustable guides nid in the operation of beveling the different sizes of welts and counters, and may be adjusted to give different angles to the bevel, as desired.

Claim.—1. The guides M and N, made and arranged substantially in the manner and for the purposes set forth.

2. The combination of the guides M and N, constructed substantially as described, with the feed rolls or wheels D and E, and the cutter C², as set forth.

143,399.—Medical Compound.—JOEL P. BARNETT, Navasota, Tex. Application filed June 2, 1873.

Alexandria senna, leptandra, podophyllum, gum acacia, Mecca, Aleppo, gamboge, hydrastis, Socotrine aloes, alcohol, sugar, and water.

Claim.—The medical compound herein described.

143,400.—Hose-Bridge.—EDWARD BAKER, Philadelphia, Pa. Application filed February 25, 1873.

Claim.—A hose-jumper, consisting of the block A, having a tongue, B, and the independent block A′, its tongue, and strip D adapted to the recess in the block A, all substantially as set forth.

143,401.—Slaughtering Apparatus.—MOSES BAMBERGER, Baltimore, Md. Application filed April 10, 1873.

An endless railway, suspended, carries the carcass from the slaughter-room to an ice-room, and thence out of the building, when desired.

Claim.—1. The combination of slaughtering-apartments and cooling-apartments, provided with movable doors or shutters, and a continuous suspended railway, provided with traveling hooks, and having switches through which the doors open and close, substantially as described.

2. The hinged sections c c, applied to the railway C, for the purpose explained.

3. The sliding gate D, arranged over the door leading into the ice-house A′, in combination with the railway C, substantially as described.

4. The bent arm r, constructed with side spurs s s and top spurs v, adapted to receive and hold in place the meat-hooks, substantially as described.

5. The combination of a slaughtering and refrigerating apartment, separated by movable partitions or doors, with an endless conveyance rail, provided with traveling hooks, and constructed with movable sections, which can be adjusted to form hooks, through which the upper door or movable part may be shut, substantially as described.

143,402.—Stove-Platform.—CLARK BROWNELL, Troy, assignor of one-half of his right to PERSHIAN J. MARSH, Lansingburg, N. Y. Application filed April 12, 1873.

The metallic platform is raised in the center to provide an inclosed air-space between the floor and the stove.

Claim.—The device represented, having the flat portion g and domed or elevated center b all made in one piece, constructed substantially as and for the purpose described and set forth.

143,403.—Corset-Clasp.—JOHN BURKE, Boston, Mass. Application filed July 26, 1873.

The catch-plate on one corset-spring takes into a corresponding depression in the other spring, so that when fastened there are no projections from the surface of the springs.

Claim.—The projections b, secured between the spring A and its covering-plate C, in combination with the metallic block c, secured between the spring B and its covering-plate D, provided with slots 12 to receive the said projections b, in botanically as and for the purpose described.

143,404.—Coupling for Vehicles.—CHARLES M. CRATAR, North Kingsville, Ohio. Application filed June 12, 1873.

Claim.—The combination, with the axles A and B, and the reach formed of two parts, C and D, pivoted together, of the curved bars H and rollers K, substantially as shown and described.

143,405.—Railroad Time-Signal.—GEORGE BENJAMIN CUMMINGS, Cambridge, Mass. Application filed June 24, 1873.

A numbered disk, revolving once in ten minutes by a suitable clock-work, is held in check by a stop-lever, which is connected with a trip operated by a passing train. At the end of one revolution, or ten minutes, the stop again falls, arresting further motion till the passage of the next train, thus indicating to the approaching train whether less than ten minutes has elapsed since the passage of the preceding train.

Claim.—1. The combination and arrangement of the shaft B, stop-lever E, stop-wheel U, and stop Q with an intermittingly-revolving indicator, when constructed substantially as described.

2. The combination and arrangement of the shaft and stop devices named in claim 1 with the eccentric-cam and the escapement-wheel Z, when constructed substantially as described.

143,406.—Die for Forging Hammers.—THOMAS DAVIS, Philadelphia, Pa., assignor to himself and WILLIAM BALDWIN, same place. Application filed August 20, 1873.

The lateral opening c is for the purpose of allowing the eagle to escape while forming the eye of the hammer.

Claim.—A die for swaging hammers, constructed as described, and having the portions a′ and a separated by the open transverse groove b, for the reception of the eye portion of the hammer, substantially as and for the purpose set forth.

143,407.—Railroad-Tie.—PATRICK S. DEVLAN, Jersey City, N. J., assignor of one-third his right to CHARLES BARNUM, Brooklyn, N. Y. Application filed March 21, 1873.

Claim.—As a new article of manufacture, the improved railroad-tie, consisting of end blocks or pieces of any material and dimensions which are adapted to support and correctly hold the railroad-rails, and which are connected or combined together by stripe or side pieces of board or hoop iron, or its equivalent, substantially as and for the purposes set forth.

143,408.—Boot-Jack.—FOLSOM DORSETT, Sr., Chicago, Ill., assignor to CHARLES PARKER, Meriden, Conn. Application filed April 12, 1873.

A boot-jack constructed in two parts, pivoted at its lower end, held and adjusted by a screw bolt and nut to vary the size of the boot-holder, with legs for its elevation rest upon it.

Claim.—The within-described boot-jack, consisting of two parts, A A, forming the foot-standard jaws and legs, united by a joint, a, a bolt, c, and an adjusting-nut, f, as and for the.

143,409.—Rein-Holder.—EZRA FARNSEY, Deep River, Iowa. Application filed March 1, 1873.

To a curved block is pivoted a spring-bar, so arranged as to hold the reins between the block and the bar.

Claim.—The combination of the block A, having the concave and lug a², with the bar B, having the chain b², the ring b³, and spring C, substantially as shown and described.

143,410.—Press for Holding Books.—LOUIS BRENTANI, New York, N. Y. Application filed August 6, 1873.

Two vertical end pieces are held apart and in position to receive the books by adjustable rods, upon the upper bow of which

the "round" of the books rest, as does also the screw-follower, which tightly compresses the books so as to prevent the coloring-liquid from damaging the faces of the leaves while their edges are being dipped.

Claim.—A press consisting of the two end pieces *a a'*, rods *b* and *c*, screw *f*, and follower *g*, substantially as and for the purpose specified.

143,411.—Railroad-Car Lamp.—JAMES L. HOWARD, Hartford, Conn. Application filed August 12, 1873.

The reflector, chimney, and globe are affixed by screw-threaded flanges and bands. In the device for locking the lamp proper to the base-ring which holds the globe, springs are added which bind the locked portions closely together.

Claim.—1. The base-ring section C, constructed with the lips *i*, and furnished with the springs *t*, in combination with the base-section collar D, which is constructed with the laterally-beveled and vertically-notched bosses *g*, spaces *p p*, and furnished with the spring-latch *e*, and the trigger *f*, all substantially in the manner shown and described.

2. As a new article of manufacture, the car-lamp fixture, consisting of the metallic chimney G G', reflector J, glass globe A, ring section C, base-ring section C, and collar section D, united and made divisible by the screw-threads on the globe A, chimney, and base-ring sections, and by the lips *i*, beveled and slotted lugs *g g*, springs *t t*, spring-pin *e*, and trigger *f* of the base-ring and collar sections, all constructed substantially as described.

143,412.—Machine for Making Metal Screws.—NAPOLEON C. HUNNELL, Hartford, Conn., assignor to JOHN JOHNSON and AMOS WHITNEY, same place, and ANDRUS CORBAN, Plainville, Conn. Application filed August 2, 1873.

On opposite sides of the revolving head dies rotating in opposite directions simultaneously cut the thread on the blank, and present the finished screw to the screw-driver which withdraws it. By a peculiar arrangement of cams and a spring-detent working in a notched disk at the back of the revolving head, the said head is revolved one-eighth or one-quarter of a revolution, as may be necessary in presenting the gage, milling-tool, or dies to the screw-blank while held in the chuck. While the screw is held in the dies, after the thread has been cut, the dies holding the screw are passed over a rapidly-revolving saw which cuts the nick, after which it is presented to the screw-driver.

Claim.—1. The combination of the revolving head *b* and the two rotating die-holders *b' b'*, so geared together that when they rotate such rotation is in opposite directions, all substantially as described, and for the purposes set forth.

2. The combination of the revolving head *b*, the two contrarily-rotating die-holders *b' b'*, equipped with the square collars *c' c'*, and the locking-guard *c''*, all constructed, arranged, and designed for operation and use, substantially as described.

3. The combination of the revolving head *b*, the two contrarily-rotating die-holders *b' b'*, equipped with the square collars *c' c'*, and the pull-off *c'*, the whole constructed, arranged, and designed for operation and use, substantially as described.

4. The combination of the revolving head *b*, the two contrarily-rotating die-holders *b' b'*, the longitudinally-reciprocating screw-driver rod *d*, the weighted lever *d'*, and the screw-driver blade *d''*, the whole arranged, constructed, and designed for operation and use, substantially as described.

5. The combination of the longitudinally-reciprocating slide *b'*, the head *b* provided with the notched collar *f*, the dog *f'*, and the cam *i*, the whole constructed, arranged, and designed for operation and use, substantially as described.

6. The combination of the sliding plate *b'*, the head *b* provided with the notched collar *f*, the ratchet and pawl *f'' f'*, the dog *f'*, the stationary cam *i*, and the sliding cam *i'*, the whole constructed, arranged, and designed for operation and use, substantially as described.

7. The combination of the sliding plate *b'*, the adjusting-screw *b''*, the standard *b'''*, the stationary cam *i*, the sliding cam *i'*, with its cam-rod and actuating-lever, the lever-arm *c'*, and the head *b*, provided with the pins *c'*, the whole constructed, arranged, and designed for operation and use substantially as described.

8. The combination of the sliding plate *b'*, the pull-off *c'*, the pin *c'*, lever-arm *c''*, provided with stop *c'''*, and the head *b*, equipped with the pins *c'*, the whole constructed, arranged, and designed for operation and use substantially as described.

143,413.—Chisel.—CHARLES E. L. JELLIFFE, Bayonne, N. J. Application filed August 8, 1873.

Any number of chisel-blades are fitted by notches and a slide to one stock and handle.

Claim.—The chisel, as a new article of manufacture, constructed substantially as shown and described.

143,414.—Stock-Car.—THOMAS J. MCCARTY, Salem, Ohio. Application filed August 18, 1873.

The stall partitions are hung upon perforated supporting-rails applied to the sides of the cars, sliding upon their supports to provide for enlarging or contracting the stalls, and locked in any desired position by pins fitting the perforations. Each partition is provided with a flexible joint to allow slight lateral yielding upon contact with the body of the animal.

Claim.—1. The perforated longitudinal supporting-rails C, applied to the sides of the car, in combination with the slides B and gates A, for the purposes set forth.

2. The combination of the gates A, slides B, perforated supporting-rails C, and pins *b*, for locking the slides in any position to adjust the gates for enlarging or contracting the stalls, said pins being accessible either from inside or outside of the car, all as set forth.

3. The gates A, constructed with the joints *h*, formed to adapt them to yield laterally with the animals to a limited extent, as set forth.

143,415.—Means of Attaching Cartridge Magazine-Blocks to Fire-Arms.—HENRY METCALFE, Lieutenant, United States Army. Application filed May 19, 1873.

Claim.—1. The combination, with a gun-stock, of hooks or projections, substantially such as described, so that a block or cartridge-holder provided with a bent wire at each end, as set forth, may be attached thereto.

2. A block or cartridge-holder, *d*, when provided with a bent wire at each end, substantially as set forth, and adapted to be carried in a cartridge-box and to be attached to a gun-stock, as described.

143,416.—Shutter-Worker.—LOUIS MULLER, Hartford, Conn. Application filed October 3, 1872.

The gear-wheels of a shutter-worker are incased in a cylindrical water-tight box forming part of the hinge, which box or case is so constructed that the journals of both wheels revolve in the dividing line of the castings.

Claim.—The water-tight frame or box *a*, formed of two parts, joined along the line of the axes of the arbors of the wheels *b c*, and forming the journals in which both the gear-wheels revolve in the dividing line of the castings, substantially as herein described.

143,417.—Whip-Socket.—FRANK B. MUNROE, Malden, assignor to WILLIAM WARREN RICHARDSON, Westfield, Mass. Application filed July 5, 1873.

The jaws for grasping the whip-handle are kept in their relative positions by the guide at the bottom and the conical part at the top.

Claim.—The combination of the ring or frustum *b*, the case A, the series of jaws F, the annular springs C D, and the bottom guide E, combined and applied substantially in manner and to operate as and for the purpose described.

143,418.—Device for Retaining Fillings in Teeth.—EDMUND OSMOND, Cincinnati, Ohio. Application filed July 23, 1873.

The small gold screw which is inserted in the bottom of a prepared cavity in a tooth is provided with split upper ends, which, when the filling has been packed around, are turned down over it to receive it more firmly.

Claim.—A screw-anchor, A, formed with a divided end or branches, *a*, to be bent back for securing the fillings of teeth, substantially in the manner and for the purpose specified.

143,419.—Bullet.—JOHN REIN and JOHN STOCK, New York, N. Y. Application filed May 22, 1873.

Claim.—The within-described bullet, provided with an annular outward-projecting ring at its front end, of the size of the bore of the gun, and with two outward-projecting rings near its rear end, one of which is of the size of the one-half of the depth of the rifled groove, and the other of the size of the full depth of the groove of the gun, as set forth.

143,420.—Apparatus for Cleaning Privies, Sinks, &c.—ROBERT R. RETOWSKY, Baltimore, Md. Application filed September 1, 1873.

Claim.—1. A privy-cleaner composed of tank A, with discharge-pipe D and hose F, and three valves and exhaust-pump on the top of the tank, and rods N N, connected to the wheels, as and for the purpose set forth.

2. The combination of the tank, pump, gas-chamber, and furnace for burning the gas, arranged substantially as set forth.

143,421.—Child's Carriage.—HENRY M. RICHARDSON, Boston, Mass. Application filed June 23, 1873.

The top may be inclined at any angle, or dropped either in front or behind the seat, or fixed in an upright position by means of rigid arms secured to the top and jointed to recessed arcs which are attached to the body.

Claim.—1. In a child's carriage, a rigid top or canopy, C, fixed upon the arms A, pivoted to the sides of the body, so that said canopy may drop in front of the seat or behind it, or be held in an upright or intermediate position, substantially as and for the purposes set forth.

2. The combination of the arms A, having the spring-bolt *f*, and pivoted upon the arc-shaped irons B, with the top C, and applied to the body D, substantially as herein shown and described, for the purpose specified.

143,422.—Lubricator.—JAMES ROSS, Charlestown, assignor to JOHN F. ROSS, North Cambridge, Mass. Application filed July 22, 1873.

The flow of oil is regulated by means of a spiral spring wound about the spindle. The wire being either contracted or expanded affects the flow of oil to the shaft.

Claim.—As a regulator for oil-cups and lubricators, the circular or polygonal spindle *b*, surrounded by a loosely-wound spiral wire, *c*, projecting through the oil-cup, and kept in contact in their lower ends with the shaft that is to be lubricated, as and for the purpose herein set forth.

143,423.—Fly-Trap.—CONSTANT S. ROUSH, Dowagiac, Mich. Application filed March 31, 1873.

A bottom disk on which rests a conical-wire trap, held by detachable spring-hooks. Within this trap is a semi-spherical wire trap with a hole in the apex. Above this is another wire chamber with several holes for the flies to pass through.

Claim.—The fly-trap consisting of the saucer-chamber A, bait-chamber B, truncated cone-shaped chamber C, having holes, as described, and disk D, provided with the elastic hooks E E, when constructed and combined as and for the purposes set forth.

143,424.—Ruffling or Plaiting Attachment for Sewing-Machines.—ARTEMAS RUSH, Chariton, assignor of one-half his right to JOHNSTON RUFFLER COMPANY, Ottumwa, Iowa. Application filed May 27, 1873.

Claim.—1. The combination, with the sliding plaiter-bar rack, of a reversible vibratory double pawl, carried by a lever or arm receiving movement from the needle bar or arm of the sewing-machine, and reversed at the proper times by means of stops on the plaiter-bar, to cause the bar to travel alternately in opposite directions, substantially as shown and described.

2. In combination with the reversible vibratory double pawl and sliding plaiter-bar and rack thereon, the two stop-pieces on the said bar, the one fixed and the other adjustable, for the purposes stated, arranged in the path of said pawl to reverse the same at the proper times, substantially as shown and set forth.

3. The combination, with the vibratory lever and the partly-cylindrical bearing carried by the same, of the double pawl, composed of a cylindrical hub encircling said bearing, and provided with a socket-piece containing a bevel-headed pin pressed up against the under side of the said bearing, to operate in connection with a wedge-shaped projection thereon, as described, and two arms or catches, each of which is adapted to engage, when the pawl is tilted to allow it, a rack on the sliding plaiter-bar, substantially as herein shown and set forth.

143,425.—Signal-Lantern.—IRA W. SHALER, Brooklyn, N. Y. Application filed June 23, 1873.

The lamp is provided with two tubes arranged near the wick-tube and extending downward to a chamber, from which a volatile fluid may be thrown upward when desired, so as by the sudden inflammation of the vapor to produce a flash-light signal.

Claim.—1. The combination, in a signal-lantern, of the reservoir provided with pump-barrel, hollow piston, and induction and eduction tubes, with a lamp, as set forth, all arranged and operating for the purpose of forcing a volume of gas into contact with the flame of the lamp, by applying a blast at the outer end of the hollow piston.

2. The combination, with the lamp-burner, of one or more tubes, arranged in such relation to the lamp-burner that when volatile oil or gas is forced through said tube or tubes from an independent reservoir it will be ignited by the flame, substantially as set forth.

3. The combination of the lamp of a signal-lantern with the apparatus, substantially as described, for forcing gas or volatile oil from a source independent of the lamp reservoir into the immediate proximity of the flame, for the purpose of producing a flash-light signal.

143,426.—Portable Gas-Machine.—BYRON SLOPER, New York, N. Y. Application filed September 23, 1873.

Claim.—1. A carburetor consisting of a cask, A, in combination with a removable cross-bar locked across its mouth, and carrying the inverted bell, substantially as described.

2. The carburetor, consisting of concentric partitions, in combination with the perforated partition to which they are attached and the distributing-pipe, substantially as described.

3. The packing for gas-machines, consisting of picked cotton and excelsior thoroughly mixed and commingled, as and for the purposes herein set forth and described.

143,427.—Medical Compound or Stomach-Bitters.—FRANK STÜTZEL, Wabashaw, Minn. Application filed September 13, 1873.

Spanish saffron, rhubarb, agarious, gum-myrrh, sedearic root, gentian, electuary theriac, tormentil root, St. John's wort, Peruvian bark, juniperi, aloes, camphor, centaury, angelica, whisky.

Claim.—The manufacture or preparation of a compound which is denominated stomach-bitters, of the ingredients, in the proportion, and for the purpose, set forth.

143,428.—Device for Detaching Horses.—SAMUEL STERR, Portland, Oreg. Application filed June 14, 1873.

To guard against accidental separation of the trace from the whiffletree.

Claim.—1. The combination of the casting B, having a slotted partition, with the longitudinally-moving headed rod, having a key, as set forth.

2. The combination of the whiffletree A, casting B, rod C having key *c'*, washer *d*, spring *e*, and disk *e'*, combined and arranged as described, for the purpose set forth.

143,429.—Car-Coupling.—JOSEPH B. TRACY, Lincoln, Del. Application filed May 3, 1873.

Improvement on Patent No. 121,823.

Claim.—1. The hook-headed draw-bar, arranged diagonally across the central line of draft, so that the hook is on one side and the pivot on the other side thereof, substantially as set forth.

2. In combination with the draw-bar and spring to which the draft is applied, the intermediately-placed lever, with which both are connected, substantially as set forth.

3. In combination with the draw-bar and buffer-bar, the concentrically-arranged springs, sliding plates, and stirrups, arranged to operate substantially as set forth.

143,430.—Putting Up Alkalies for Making Soap.—JOHN H. WYLD, Philadelphia, Pa., assignor of one-half his right to ABRAHAM EDWARDS, same place. Application filed June 18, 1873.

Claim.—As a new article of manufacture and commerce, a saponifying composition consisting of slaked lime and alkali, as set forth.

143,431.—Fastening for Bedsteads, &c.—JAMES M. RAIRD, Wheeling, W. Va. Application filed January 18, 1873.

Blocks with oblique faces are fastened to the longitudinal and transverse rails and to the legs, which interlock and are held in place by a locking-piece.

Claim.—1. In combination with the rails A B of a bedstead, the blocks *a b*, having oblique faces, and arranged to interlock, as shown and described.

2. The locking piece or block *d*, in combination with the blocks *a b*, applied to the rails A B, and blocks *a b*, attached to the legs D C, as specified.

143,432.—Toy Device for Making Soap-Bubbles.—SAMUEL B. ELIAS, New York, N. Y. Application filed July 5, 1873.

Claim.—1. The instrument or toy for producing soap-bubbles, consisting of a double tubular casing, A, air-pipe D, receptacle E, valves *g h i*, and exit-tube F, arranged substantially as and for the purpose described.

2. The casing A, provided with the parts B C, communicating, by slot *a* and opening *b*, for introducing the soap and water, and the cork *d*, as set forth.

3. The receptacle E, having apertures *f* and opening for air-pipe, for the purpose described.

4. The exit-tube F, having concave face, with perforation *e*, as set forth.

5. The upper tube B, having guide-casing *h*, with aperture *f'*, for the purpose described.

6. The valve arrangement described, consisting of valve-rod *g* with flattened parts, cap *h*, spring *i*, and disks *i*, as specified.

143,433.—Hammer.—OSCAR L. BROWN, Hopkinton, Mass. Application filed August 21, 1873.

The gage is pivoted to the hammer, so that it may be elevated when it is desired to introduce the work; and when turned down is held in a horizontal position by means of a flange or step formed on the gage.

Claim.—The hammer *a*, in combination with the pivoted vertically-moving gage *c*, provided with a suitable flange or stop, substantially as shown and described.

143,434.—Plow-Carriage.—HENRY M. BULLITT, Louisville, Ky. Application filed June 28, 1873.

Elevated axle-arms are connected by an adjustable cross-bar, from which depends a hanger for carrying the plow-beam. The cross-bar is raised or lowered by a series of holes in the standards, and may be placed at unequal heights to admit of one wheel running in the furrow.

Claim.—The uprights C, provided with axles B at their lower ends, and connected together at top by an axle, D, upon which depends a hanger, K, in combination with the stirrup L, L M, brace-rods G G, and adjusting-holes H P, and plow-beam F, constructed and arranged as and for the purpose set forth.

143,435.—Axle for Vehicles.—THEODORE F. COLEMAN, Allegheny City, Pa. Application filed May 28, 1873.

Claim.—The spindle A, provided with longitudinal projections *c*, in which are cut notches to fit the corners of the iron axle B, in combination with the axle B, as and for the purposes described.

143,436.—Sliding-Hook.—PHILIP J. COON, Nunica, Mich. Application filed April 7, 1873.

Various devices for gaging and scribing wood-work are combined in one stock.

Claim.—1. A combined gage and square, composed of the body A B, provided with right-angle groove E, and guide C, and graduated removable and changeable slide D, substantially as specified.

2. A combined gage, square, and scribe, composed of the body A B, provided with a right-angle groove, E, guide C, graduated removable and changeable slide D, and knife F, substantially as specified.

3. The herein-described combination tool, composed of the body A B provided with right-angled groove E, guide C, graduated removable and changeable slide D, knife F, hooks A' B', and sliding marker G, all arranged substantially as specified.

143,437.—Feather-Renovator.—ELIASON B. COOPER, Monticello, N. Y. Application filed August 16, 1873.

Claim.—The feather-renovator, consisting of outer casing A with doors D and perforated screens E, steaming-chamber C with drying-chamber L and dumping-box H arranged thereon, hollow crank-shaft F F with perforated drums G G, and steam-tubes *d d'*, all arranged and operated substantially as and for the purpose described.

143,435.—Burial Case.—JEROME B. COX, San Francisco, Cal. Application filed August 16, 1873.

The upper inner edges of the sides are rabbeted, so that the upper edges of the thin metal lining can be secured therein by the pressure of the inner lid of the coffin. This prevents the lead lining from falling down by its own weight. A second cover is placed over the one above mentioned.

Claim.—1. The coffin-box A, having the upper inner edges of its sides rabbeted, in combination with the lining B and supplementary or inside cover C, when said lining is made to pass under and over the edges of the supplementary cover, substantially as and for the purpose above described.

2. A burial case, consisting of the box A, lining *b*, supplementary or inside cover C, and outside cover F, when the parts are combined and united substantially as above described.

143,439.—Mode of Operating Bellows of Furnaces.—HUGH CRUMLISH, Buffalo, N. Y. Application filed June 25, 1873.

A double or bent rod is connected to the frame on one side, and on the other is pivoted to the angle of the bent rod, which connects the lever-handle with the bottom of the bellows.

Claim.—The combination of the rigid angle arm or rod K, pivoted, bent, or double rod L, and lever D, with the bottom of the bellows, as and for the purpose specified.

143,440.—Propulsion of Vessels.—GEORGE BOUCHER DE BOUCHERVILLE, Quebec, Canada. Application filed July 19, 1873.

System of gearing, in connection with a swinging platform and propeller-shaft of a navigable vessel, whereby a continuous motion is imparted to the propeller, whichever way the vessel rolls.

Claim.—In connection with a vessel, the propeller-shaft, the pinion V, bevel-wheels U U on independent sleeves of the same shaft, F, ratchet-and-pawl mechanism R *r* S, bars 14, rods D *d*, and the suspended platform B, all combined as and for the purpose described.

143,441.—Pulley-Block.—ALFRED S. DICKINSON, Brooklyn, N. Y. Application filed April 18, 1873.

The sheave having flanges and projection-arms on each side of the groove, pivoted and combined within a block having a tapering or V-shaped rib and furrows. When the rope is allowed to slack the slack end, by its contact with said rib, is caused to slip sidewise into one of the furrows and becomes caught by the arms and held with safety.

Claim.—1. The shell or block A, provided with the rib G and the furrows H H, substantially as and for the purpose herein set forth.

2. The sheave or pulley B, provided with flanges and arms or raised projections F F, pivoted and combined within the shell or block A with the rib G and the furrows H H, operating substantially as and for the purpose herein mentioned and shown.

143,442.—Middlings-Separator.—ROBERT L. DOWNTON, Collinsville, Ill. Application filed May 24, 1873.

Middlings fed onto a disk, which distributes them centrifugally upon an inclined apron, whence they pass down the heavier onto an inclined apron and exit through discharge-spouts, while the lighter are drawn by the suction-fan into the slotted drum, thence through one pipe and discharged through another into one of a series of draft-regulating chambers, through which they pass, for separating them into different grades.

Claim.—1. The drum C, provided with openings and with slotted bands, in combination with the casing D provided with adjustable openings, the distributing-disk F, and fan-blower I, substantially as herein shown and described.

2. The series of chambers K L M, provided with inlet and outlet openings at a different level, with slides N and adjustable partitions O, except the last chamber, in combination with the fan-blower I, the outer case D, the drum C, and the distributing-disk F, substantially as herein shown and described.

143,443.—Stove-Grate.—GEORGE W. ELTONHEAD, St. Louis, Mo., assignor to himself and WILLIAM GERKHARDT, same place. Application filed December 19, 1872.

The grate is cylindrical in form, so that the coals will rest on that portion of its surface which is uppermost. A small space is left between its perimeter and the stove-lining on either side, wherein the coals are crushed when the grate is revolved.

Claim.—The described grate, composed of the solid ends C^1 C^2, having pivot-journals *c c'* and the flat bars D, in combination with a stove, A, as described, for the purpose set forth.

143,444.—Apparatus for Graining Wood, &c.—CHARLES FALES, New York, N. Y. Application filed January 25, 1873.

Relates to special construction of roller for graining surfaces of different widths.

Claim.—1. In combination with frame A, the adjustable shells C, screw-bolt *f*, female screws *g*, nuts h, and washers *h'*, for the purpose described.

2. In combination with frame A and shells C, the adjustable bands B, hand-rollers d, set-screws *e*, and recessed slots *b*, as and for the purpose set forth.

3. In combination with the subject-matter of the foregoing clauses, the handle-frame D, set-screws *i*, slots K, belt and screw *l*, as described.

143,445.—Shoe-Fastening.—GEORGE L. FITCH and HENRY M. JONES, Little Lake, Cal. Application filed March 19, 1873.

The button and elastic are both secured by a single fastening-strip to one quarter, and to the other the second button is made to hook.

Claim.—The combination of the button *b*, having its fastening-attachment for securing one end of the elastic with the button *f*, provided with a hook engaging in the perforated plate *e*, substantially as and for the purpose set forth.

143,446.—Apparatus for Freezing Liquids.—SAMUEL S. FITCH, New York, N. Y. Application filed August 20, 1873.

An air-chamber intervenes between the wooden case and the chambers for the freezing-mixture. Water admitted by the induction-pipes falls upon the percolator, is broken into fine spray, and, in its descent in the middle chamber, is frozen to a semi-solid state, similar to snow.

Claim.—1. The percolator or foraminous plate C and the receiving and refrigerating tanks or chambers A B A, arranged as specified.

2. The combination of the percolator C, the chambers A B A, and the encompassing wooden case D, and cover E, with the air-spaces or chambers intervening between each and the combined chambers A B A, all being arranged substantially in manner as specified, the whole being provided with one or more inducts, H, as set forth.

3. The combination of the auxiliary cover F with the percolator C and the chambers A B A, arranged in a wooden box, as specified.

4. The double-hooked rod G, arranged and combined with the percolator C and the chambers or tanks A B A, all being as explained.

143,447.—Saw-Set.—THOMAS R. GRIMES, Fremont, Ohio. Application filed February 27, 1873.

The conical frustum C is adjustable on the screw *c*, and the screw *c* is adjustable on the slotted bar B, as are also the rests G and the griping device D' D.

Claim.—1. The combination of the adjustable rest D with its screw *c'*, the adjustable rests G G, and the anvil-faces *b b*, substantially as described.

2. The combination of the anvil A, cone C, and the auxiliary rests, the whole constructed and operating substantially as described.

143,448.—Scaffold-Pole Clamp.—HENRY HANKING and HERMAN ALLES, New York, N. Y. Application filed March 5, 1873.

A self-holding clamp and support for the poles of scaffolding.

Claim.—1. The combination of the clamping-lever J with the yoke A, eccentric lever B, and binding-chain C, substantially as specified.

2. The combination of the lever J, blocks O, bar Q, and yoke A, substantially as specified.

143,449.—Mordant for Dyeing.—GUSTAV A. HAGEMANN, Copenhagen, Denmark. Application filed June 21, 1873.

The acetate of soda is calcined and pulverized, the sulphate of alumina is ground and sifted, and the two mixed by means of a sieve in the proportions of two parts of acetate of soda to three parts of sulphate of alumina.

Claim.—As an article of manufacture a package of coarse powder of calcined and pulverized acetate of soda and sulphate of alumina, ready to be dissolved for the production of the mordant acetate of alumina, as described.

143,450.—Corn-Planter.—EDWARD E. HERREGAN, Downsville, Wis. Application filed June 17, 1873.

The feeding device consists of a rocking semicircular or half cylinder, having a seed-cup that passes an opening in the bottom of the seed-box, and thus conveys the seed to the ground through the conductor.

Claim.—The oscillating receiver *f*, platform *g*, and planting-tube h, in combination with the hopper *a*, frame *b*, and guide *c*, substantially as shown, and for the purpose specified.

143,451.—Sad-Iron.—BARBARA JONES, State Line City, Ind. Application filed August 30, 1873.

A hollow sad-iron, open at the rear end for the insertion of a heater, provided with a spring-gate that slides in grooves.

Claim.—The hollow body A of a sad-iron, in combination with the sliding gate C, stems C *c c'*, thumb-piece C^2, lug *d*, and spiral spring E, substantially as and for the purpose specified.

143,452.—Lamp.—FREDERIC KAMPFE, New York, N. Y. Application filed August 14, 1873.

A safety-valve, which permits the exit of gases, is set in a collar affixed to a lamp-reservoir, and is provided with spring-flanges to prevent its being forced out of the collar.

Claim.—The combination, with a lamp-reservoir, A, of the flanged collar C and the valve B, consisting of the shouldered head *a*, forming a cap to close the opening in the collar, the tube *b* with openings *x x*, and the spring-arms *c c*, all made in one piece, substantially as and for the purposes set forth.

143,453.—Hot-Air Furnace.—OTIS S. KELSEY, Hartford, Conn. Application filed June 19, 1873.

Claim.—The combination of the fire-box *d*, cold-air pipes *p* having bosses or brick supports *n* and regulating-tubes *q'*, water or air heat *q*, ornithorhynchal chamber *b*, heating-pipes *q*, rabbeted-edge plate *a*, and doors and frames A, substantially as and for the purpose set forth.

143,454.—Sheave.—ALLEN LAPHAM, Paterson, N. J., assignor to himself and ORVILLE W. LEONARD, same place. Application filed August 22, 1872.

One handle is pivoted a short distance from its end to the shank of one blade, while the opposite end is connected by a link-joint to the other handle, which is merely an extension of the shank of the blade.

Claim.—The combination of two arm-sections, A B, pivoted at B, the one-piece arm D pivoted to A at I, and the strap H pivoted to B D, respectively, at S and H, as and for the purpose described.

143,455.—Machine for Splitting Wood.—DAVID MILLIKEN, New York, N. Y. Application filed April 17, 1873.

A reciprocating knife is arranged in connection with a series of stationary knives so as to first split the wood into sheets and then transversely into smaller portions.

Claim.—The adjustable gage M, arranged in relation to the cutter and stationary knives substantially as described, and for the purpose set forth.

143,456.—Fountain and Aquarium.—JONATHAN MOORE, Brooklyn, N. Y. Application filed May 10, 1873.

A basin and supply-pipe; also an overflow-pipe extending up through the bottom of the basin concentric to the supply-pipe. The overflowing water escapes through a passage communic to the pipe which supplies the water to the jet.

Claim.—In combination with a fountain-basin, A, the casing D D' surrounding the discharge-pipe C, and arranged to receive the water through the openings *d*, and thence through the open-topped discharge-pipe C, as and for the purposes specified.

143,457.—Toy Gun.—ROBERT T. MURPHY, Chicago, Ill., assignor to ALFRED JAMES, same place. Application filed July 11, 1873.

The trigger and spring-catch are in one piece of flat metal fast at both ends. The turn forming the trigger is sharp at the top, to form a shoulder for retention of the push-rod.

Claim.—In combination with the bar D of a toy gun, the spring F, when constructed and arranged to operate in the manner described and shown.

143,458.—Watch-Maker's Lathe.—JOHN M. ORAM, Goshen, Ind. Application filed January 10, 1872.

To give, practically, greater extension to the driving-arm K, the collar D, that confines the head A to the mandrel B, is sunk into the face of said head, and a groove around the head permits it, and, with it, the article that is being turned, to be rotated by the application of the cord, and thus avoid the application of the cord to the article itself.

Claim.—The combination of the lathe-center C, lathe-head A, axle B, frictional collar C, and driving-arm K, all operating together as and for the purpose described.

143,459.—Car-Coupling.—SAMUEL A. OTIS, Boston, Mass. Application filed May 6, 1873.

The toggles in the lower end of the link-pin are operated by a rod passing down through it; and for the sake of further security the rod has two clasping-arms pivoted in its head and catching over flanges around the pin-hole in the draw-head.

Claim.—1. The combination of the pin A with the toggle D D^1 D^2 D^3 and rod E, substantially as described, and for the purpose set forth.

2. The combination of the pin A with the grapple K K', and draw-head having the flange *h h*, substantially as described, and for the purpose set forth.

3. The combination of the grapple K K' and the pin A with the toggle D D^1 D^2 D^3 and the rod E, substantially as described, and for the purpose set forth.

143,460.—Shutter-Fastening.—ANDREAS JOHANSON PALMBERG, Boston, Mass., assignor to CHARLES S. HICKS, same place. Application filed August 29, 1873.

Claim.—A blind-fastener consisting of a metallic spring-wire, d, attached at one end to the blind, and provided with a handle, *g*, formed upon it, and having its other end, *f*, projecting as a bolt through a hole in the lower part of the blind, in combination with the perforated fastening-plates A and *f*, or their equivalents, as and for the purpose herein set forth and described.

143,461.—Means for Forcing Ashes from Vessels.—JOHN PALMER, Sandisfield, Mass. Application filed May 26, 1873.

Claim.—1. The air-cock *i*, arranged in the cover of an ash-ejector to admit of the escape of air from the barrel B, and serve as a test of the tightness of the closing of the valve below, substantially as described.

2. The arrangement of lever or wrench J and the handle *i'* of the cock *i* in the manner described, so that the wrench cannot be turned without opening the cock.

3. In combination with the ash-receptacle B, the tight-fitting cover I, suitable provisions for opening and closing the ash, and for introducing air under pressure to expel the contents, the water-connection G, with suitable connecting means, so arranged that the flues below may be washed clean of all matter that may prevent the proper shutting of the valve or valves, as herein specified.

143,462.—Fire-Escape Ladder.—GEORGE PULSIFER, Deerfield, N. Y. Application filed May 6, 1873.

The drum-shaft, by which the extension-ladder is elevated, carries two disks, one ratcheted and the other plain. The detent-pawl is arranged to be shifted from one to the other, as it is desired, to use it as a pawl or as a brake.

Claim.—In a fire-escape, constructed as set forth, the combination of the disk or pawl *e* with the ratchet-wheel *d* and disk *c*, to operate in combination with each other, substantially as described.

143,463.—Cupola and other Furnaces.—LOUIS QUINCKE, Joliet, Ill., assignor of one-half his right to FRANZ MÜNZLER, Carondelet, Mo. Application filed February 24, 1873.

A strip of metal, having a curved cover open toward the blast, and a wire or rod attached to the cover, is placed in the blast-pipe between the wind-box and the tuyeres, so that a portion of the blast entering the box will raise the rod, thereby indicating the velocity and pressure of the blast.

Claim.—The wind-gage described, consisting of the combination and arrangement of the parts *s t r e* and pipe *b*, for the purpose set forth.

143,464.—Picture-Frame.—FELIX REINSCHMIDEL, New York, N. Y. Application filed June 26, 1873.

Claim.—The combination, in a round or oval picture-frame, of the part A, of wood or other material, the cloth cover B, and the open-metal rings or bands D and E, substantially as specified.

143,465.—Tire-Heating Furnace.—JOHN G. ROGERS, Williamsburg, Ohio, assignor to VOLNEY STOCKTON, same place. Application filed May 1, 1873.

The blast-pipe is extended in circular form under the furnace, and has nozzles attached, which extend perpendicularly through the bottom of the furnace.

Claim.—The combination of the annular furnace A, having the hinged cover, ribs D, and smoke-flue E, with the circular tuyere B, having receiving-nozzle C and discharge-nozzles *a a a*, and any suitable blower, as and for the purposes set forth.

143,466.—Machine for Cutting Gores in Stoves.—CHARLES RUGGLES, Huron, Ohio. Application filed September 6, 1873.

A series of circular saws are so arranged as to have a vibratory movement upon their mandrel, which enables them to cut gores from the material, the size of which is governed by the amount of vibration imparted to the saws.

Claim.—1. The goring mechanism composed of sliding frame L with forms O, arranged to operate in combination with the adjustable gang of wabble-saws M, substantially as set forth.

2. The combination of saws M, pivots *m*, hollow shaft N, sliding concentric shaft P with projecting spuds *p*, as and for the purposes substantially as set forth and shown.

143,467.—Stereoscopic-Picture Holder.—SEWALL D. SAMSON, Woburn, and GEORGE H. SMITH, Waltham, Mass. Application filed May 28, 1873.

Turning the knob in the center of the box-top revolves the inner stereograph-compartment, exposing the open ends of the same.

Claim.—A holder for stereoscopic pictures consisting of the case A B C D, in combination with the revolving compartment H K and handle P, substantially as specified.

143,468.—Knitting-Machine.—LORENZO D. SAMSON, Cohoes, N. Y. Application filed September 3, 1873.

The stops which shift the cams in the "Lamb" knitting-machine are made yielding, to prevent wear, noise, and jarring, and are adjustable by set-screws.

Claim.—1. The spring-stop L or its equivalent, arranged to act in combination with the cam-shifters or plates E of a knitting-machine, substantially as described.

2. The spring-stop L, provided with screws *s*, or equivalent means for adjusting it, as set forth.

143,469.—Support for Wash-Tubs.—GEORGE F. SHAW, West Roxbury, Mass. Application filed February 18, 1873.

The device is constructed with three uprights pivoted at two points, and by the aid of a detent forms, by opening the parts, a substantial support for a tub, and can be folded into small space.

Claim.—The combination of the bars A A' B B' C C' with each other and the detent H, substantially as described, and for the purpose set forth.

143,470.—Machine for Clearing Streets of Snow.—RILEY A. SHIRK, Georgetown, D. C. Application filed February 20, 1873.

A snow-shovel having hollow walls and adapted to be heated is connected to the portable boiler by means of links and flexible tubes.

Claim.—1. A snow-shovel attached to a portable boiler by means of the connecting-links N and tubes L, as shown and described, for operation in the manner set forth.

2. The guard P, in combination with the shovel M, substantially as and for the purpose specified.

143,471.—Sheet-Metal Roofing.—Roslin A. Smith, Fond Du Lac, Wis. Application filed September 12, 1873.

The metallic sheet is turned over the triangular fastening-pieces B at the sides, and at the ends is slit to form the lips b. Clips G serve to attach the sheet to the roof, and the joint is covered by the interlocking-lip b of the next sheet. A strip of felt is sometimes placed in the joint.

Claim.—The herein-described roof, consisting of the plates A, having their sides bent and secured to the strips B and their ends locked together and secured by the clips G, as shown and described.

143,472.—Compound for Painting and Coating Wood.—Hiram F. Snow and James H. Davis, Dover, N. H. Application filed September 8, 1873.

Claim.—1. Our said special composition, it consisting of dead-oil, whiting, linseed-oil, ground slate or steatite, coal-tar, sal soda in solution, and resin dissolved in alcohol, made in manner and of the materials as herein before first explained.

2. The combination of such composition with vermilion red and an additional quantity of dead-oil, or with such and a small amount of the alcoholic resinous solution, all as explained.

143,473.—Machine for Punching Sheet Metal.—Melvin Stephens, Brooklyn, N. Y. Application filed June 12, 1873.

The holding and stripping plate h is pressed down by springs acted upon by cams and pins, and is raised by the bar d, actuated by crank-pins and connections b' b' passing through the forked ends of the bars h. In the bar d is fitted a holder or bar carrying three or more punches, which pass through holes in the stripper and outer dies in the bed-plate.

Claim.—The die-plate g, clamping-plate h, and actuating-rods k, in combination with the punches i and punch-bar f, inserted into the dovetailed recess in the head-block d, substantially as set forth.

143,474.—Belt-Fastening.—Peter Subit, Boston, Mass. Application filed March 3, 1873.

Claim.—In a belt-lock, the combination of the single curved plate a, provided on its concave side with projecting screw-sockets b, with the screws c, having enlarged flat heads d, substantially as described, for the purpose specified.

143,475.—Pitman.—Joseph Swan, Richmond, Ohio. Application filed August 20, 1873.

Claim.—A pitman-rod, c, having an enlarged end, c, divided into two halves, c c', such halves c c' having each formed within their lower ends one-half of the slot f, forming jaws g g' and shoulder h, said jaws having a plain surface on their inner sides, in which are formed recessed bearings i i' for the reception of journals i' formed on the knife-head i², the halves of the pitman-rod being held firmly together by means of the combined screw-nut and cap l, substantially as set forth.

143,476.—Artificial Teeth.—William C. Tracy, Brooklyn, N. Y. Application filed August 30, 1873.

A platinum backing is baked into the single teeth or blocks of teeth. This platinum backing is used in connection with the ordinary means of fastening and in securing the teeth more firmly upon the plate.

Claim.—The platinum lining C, baked upon the back of the teeth, and either with or without the pins D, substantially as herein shown and described.

143,477.—Machine for Waving or Embossing Leather Straps.—Daniel H. Unger, Philadelphia, Pa. Application filed June 12, 1873.

The movable flanges of the wheels A B are adjusted to admit straps of differing widths by means of a set-screw. A lever is provided to relieve the shaft from pressure, that the strap may be readily introduced between the cylinder and the rollers.

Claim.—1. The two separate rollers A and B, and their respective adjustable flanges a'' and b', with their keys 4 4, in combination with the adjusting screw-nut c' and the rotary shaft C, the said parts being constructed and arranged in a suitable frame, D, so as to operate substantially as and for the purpose hereinbefore set forth.

2. In combination with the shaft C and the frame D, the raising and lowering device, consisting of the parts I i' i'' i'', lever K, and gudeon d' d', constructed and arranged to operate substantially as and for the purpose hereinbefore set forth and described.

143,478.—Wood Fence.—Robert F. Ward, Senatobia, Miss. Application filed June 7, 1873.

Two cross-stakes and central vertical post are united by inclined slats, leaving spaces for the ends of the horizontal rails.

Claim.—The cross-stakes A A and uprights C, connected by inclined slats F, in combination with the rails G, as and for the purpose described.

143,479.—Corset.—Julius Waterman, New York, N. Y., assignor to Waterman & Mayer, same place. Application filed July 24, 1873.

Claim.—A corset having the single breast-gore f inserted in the fabric of the corset-front, and the gore b introduced between the front piece d and back piece c, as and for the purposes set forth.

143,480.—Ore-Stamp.—Lewis D. Wade, Greenville, Cal. Application filed August 1, 1873.

The rollers aid in overcoming the friction between the spring-bar and lifting-cam.

Claim.—The cams composed of the rollers J, turning between the flanges K, and constructed to operate upon the ends of the springs E, substantially as herein described.

143,481.—Wheel for Vehicles.—Michael B. White, McLean county, Ill. Application filed December 26, 1872.

For the purpose of expanding the fellies in vehicle-wheels.

Claim.—1. The adjusting-nut b and jam-nut a, in combination with the thimble c, having a reduced screw-threaded portion, and the projections f for engaging the spoke-shoulder, as shown and described.

2. The T-shaped device E, having one of its arms notched to fit between the abutting ends of the fellies and the others perforated to receive screws, whereby it is secured to said fellies, as shown and described.

143,482.—Process of Treating Refuse Matter.—Charles Whittier, Boston, Mass., assignor to William L. Bradley, same place. Application filed May 6, 1873.

Should any leakage take place from the annular heating-chamber it will be simply hot air which will assist the drying process.

Claim.—The method of treating animal matter by inclosing and mechanically agitating the matter in a horizontal drum or cylinder, into which air is introduced, the cylinder being heated by a current of hot air forced through an annular chamber encompassing the horizontal cylinder.

143,483.—Railroad-Signal.—William Wickersham, Boston, Mass. Application filed September 25, 1872.

A spring-arm, projecting from a car or engine, strikes a lever attached to the piston-rod of a pneumatic apparatus connected, at any desired distance, by tubing to a vertical cylinder having suitable valves to trip its piston at the proper point of each stroke. To the piston-rod is attached a hook, which, as the piston rises and falls, turns a ratchet-wheel on the shaft, which bears the rotary signals.

Claim.—1. The combination of the lever a and the lever c c, constructed substantially in the manner described, so that the lever a will be unlocked from the plate b and swing around out of the way when passing through a door, and yet be permanent and fixed when pressure is made against its outer end, substantially as described, and for the purpose set forth.

2. The device for bringing the lever a to its central position after it has been moved around to one side, consisting of the inclined edges b^1 b^1 of the plate b, combined with the spring f, the bearing or pin e', and the slot c, as and for the purpose set forth.

3. The levers i i with their springs k k, in combination with the piston h, as and for the purpose set forth.

4. In railroad-signals, the combination of the cylinder n n, piston-rod o^1, and hook o^2 with a ratchet-gear, constructed and arranged as described, so that the ratchet-gear will be turned on its axis the distance of one or more teeth each time the cylinder is inflated or filled with compressed air, as and for the purpose set forth.

5. The combination of the ratchet p and its shaft t with the fly-wheel v^1, having a bell attached thereto, or equivalent device, and its spring v, constructed and arranged substantially as described, and for the purpose set forth.

6. The openings s s in the cylinder n n, allowing the compressed air in said cylinder to escape for the purpose of enabling the piston, its rod, and the hook o^2 to fall to their lowest position, so that the said hook can take another notch in the ratchet-gear p, in readiness to raise it on the next inflation of the said cylinder, as and for the purpose set forth.

143,484.—Dish-Washing Machine.—Charles H. Williams, Syracuse, N. Y. Application filed October 22, 1872.

A semi-cylindrical vessel is hung on journals within a cylinder that is revolved by a crank, and has buckets for throwing water over the dishes in the vessel. All are inclosed in a covered tub.

Claim.—1. The sheet-metal cradle A, with its corrugated supports s s s and openings f f f, supported by journals a, which rest in hollow journals b, all arranged as described, for the purpose set forth.

2. The revolving cylinder B, having V-shaped perforated buckets c, in combination with the cradle A, the whole being supported by hollow journals b b, bearing in the ends of the closed tub C, all arranged as and for the purpose set forth.

143,485.—Apparatus for Granulating Slag, Iron, &c.—Charles Wood, Tees Iron Works, Middlesborough-on-Tees, England. Application filed September 13, 1873.

Slag, ecoria, or cast-iron, as it flows in a fine stream from a runner, is received into water contained within a wheel or revolving tank, and is reduced to granules by the contact and motion of the water. The revolving tank has a series of floats, which agitate the water and elevate the granules, delivering them into a spout, which conducts them to wagons.

Claim.—1. The combination, substantially as before set forth, of the water-tank for receiving the slag, the elevating-floats, and the delivery-spout.

2. The arrangements of granulating apparatus, consisting of the revolving tank A, floats, buckets, or agitators E, runner F, and delivery-spout G, combined substantially as herein described.

143,486.—Machine for Pointing Wire.—Frank H. Ahern, Franklin, N. H. Application filed March 25, 1873.

Claim.—The revolving spur-gear D, in combination with the revolving spur-gear M, spring G, and compressing slide E, carrying the upper die, when the teeth of the revolving spur-gear D are longer than those of the revolving spur-gear M, substantially as and for the purpose described.

143,487.—Blast-Furnace.—Ebenezer B. Andrews, Lancaster, assignor of one-half his right to John G. Deshler, Columbus, Ohio. Application filed May 15, 1873.

Consists in the construction of cross-walls, arches, bars or supports of whatever form, made of fire-brick, stone, or other suitable refractory material.

Claim.—A blast-furnace provided upon its interior with sustaining-walls a b of refractory material, substantially as and for the purpose set forth and shown.

143,488.—Commode.—John D. Averell, New York, N. Y. Application filed March 15, 1873.

The annular tank is of the same diameter as the top of the vessel upon which it rests, but is higher at the back than at the front, to which it gradually slopes to afford a support for the back and arms of the person using the same.

Claim.—A commode having a lower vessel with annular tank fitting on the top thereof, in such manner as to afford a rest for the back and arms of the sitter.

143,489.—Inking Apparatus.—Franklin L. Bailey, Boston, assignor to Joseph Watson, Everett, Mass. Application filed July 7, 1873.

An ink-distributing roller is reciprocated laterally upon the ink-cylinder to spread the ink, the frame which holds the roller being moved in one direction by a spring after a vibrating lever has moved it in the opposite direction. The lever receives its motion from a cam. This cam forms the periphery of a ring or inside gear with which meshes a pinion fixed to the shaft of the ink-cylinder. If the number of teeth in the ring cannot be exactly divided by the number of the teeth on the pinion—if the one number is not a multiple of the other—the roller will constantly assume new positions with reference to the cylinder.

Claim.—The combination, for the purpose described, of the cylinder E, roller O, frame V, its rod and spring L, the lever Z, the gear-ring H with its cam, and the pinion R.

143,490.—Middlings-Purifier.—John Bandon and John Wiggin, Jr., Dayton, Ohio. Application filed May 29, 1873.

The shaker receives a slight vertical action, by means of the knockers and tappets, to prevent the cloth from clogging. Vertical action and inclination of shaker regulated by the elastic suspension-arms.

Claim.—The combination of the elastic suspension-straps W, knockers e, and tappets f with the screen, substantially as described.

143,491.—Car-Coupling.—Andreas W. Bohaker, Granville, Nova Scotia. Application filed March 19, 1873.

The pin-supporter is dovetailed on its upper side to fit into a dovetailed groove in the upper side of the mouth of the draw-head, and is thrust under the pin by means of arms extending through slots in the sides of the draw-head.

Claim.—The draw-head A, provided with the slots D D and dovetailed groove I, in combination with the pin G and sliding block E, having arms C C on its sides, and notch E for the reception of the link, and dovetailed projection H, all constructed and arranged to operate as set forth.

143,492.—Apparatus for Separating Ores and other Substances.—Hezekiah Bradford, Reading, Pa. Application filed September 23, 1873.

The jig-box is reciprocated up and down in a tank of water. The current created carries the lighter substances through the upper opening of the box into a separate chamber, and the heavier portions through the lower opening into a separate chamber.

Claim.—1. A jig-box with a perforated bottom, that is reciprocated in water and provided with two places for delivery, one at a higher level than the other, for passing away the materials of different specific gravities, substantially as set forth.

2. An adjustable gate or gates applied to enlarge or contract the lower delivery-opening in a jig that is provided with a perforated bottom and is reciprocated in water, substantially as set forth.

3. A cut-off applied to the lower delivery-opening of a jig-box that is reciprocated in water, substantially as set forth.

143,493.—Farm-Gate.—William S. Brown, Norwood, Ill. Application filed July 14, 1873.

This gate opens by moving in a direct line away from the latch-post, two of its rails fitting in a deep groove in a friction-pulley which sustains the whole weight, said pulley being confined on one side to hold the end of a horizontal pin from the post, said pin turning upward at right angles into an eye-bolt universally attached to the pulley.

Claim.—The roller D, constructed with the recess d, and combined with the plate c and axle eye-bolt f, substantially as shown.

143,494.—Curtain-Fixture.—Harvey H. Burritt, Newark, N. J., assignor to William A. Cook, same place. Application filed March 10, 1873.

Upon the inside of one of the heads of a hollow spring-roller project one or more lugs, to which a ball-crank is attached, one arm of which lies parallel with the axis of the roller, and has a weight attached to its end. The other arm is forked, and embraces the arbor near a projection. When the roller is revolved slowly the forked arm engages with said projection, but when the roller is revolved swiftly said forked arm passes by said projection.

Claim.—The arrangement of the lever or ball-crank H K and arbor I M with the spring shade-roller E, constructed and operated substantially as shown and described.

143,495.—Bayonet-Socket.—Bethel Burton, Brooklyn, N. Y. Application filed April 10, 1873.

The particular construction of the socket, whereby a smooth handle is formed, adapting the instrument to be used by hand.

Claim.—1. The combination, substantially as herein described, of the socket provided with a straight slot and rim or shoulder and the ring arranged at the rear end of the socket, as and for the purposes described.

2. The combination, with the subject-matter of the foregoing claim, of the attachment b', whereby a perfect sword or other handle and bayonet-socket is produced, as set forth.

143,496.—Nail-Extractor.—George J. Capewell, Cheshire, assignor to Eli Curtiss, Watertown, and Douglass F. Maltby and Lewis J. Atwood, Waterbury, Conn. Application filed April 11, 1873.

The jaws are provided with a concealed spring, and the lever has attached to it a movable hammer for driving the jaws into the wood around the nail.

Claim.—A nail-extractor having its stem provided with a stationary and movable jaw, the inner faces of which are recessed to receive a circular spring for holding the jaws apart, in combination with a tubular weighted rammer secured to the stem, substantially as described.

143,497.—Cop-Winding Machine.—William Chadwick and Samuel Lowndes, Brooklyn, N. Y. Application filed March 24, 1873.

The "building spindle" on which the thread is wound is moved by the winding-spindle, and as the cop increases in size and moves from the cup the spindles rise, and the stop-rod descends until the projection at its lower end comes under a projection on the building-rail, which stops the machine. The size of the cop and the engagement of stopping devices are governed by the devices enumerated in the third clause.

Claim.—1. The combination of the stop-rod Q, chain r, and pulley s with the winding-spindle B, the building-rail K, and the building-spindle E, as shown and described, for the purpose specified.

2. The bell crank S, in combination with the rod T, connected with the winding-spindle B, as shown and described, for the purpose specified.

3. The finger R, capable of adjustment in the holder v on the sleeve D, in combination with the stop w on the stop-rod Q, as shown and described, for the purpose specified.

143,498.—Truss for Coaches and Cars.—George F. Chalenden, Burlington, Iowa. Application filed January 16, 1873.

A sheet-iron truss is placed around the car between the sill and belt-rail, secured to the former by angle-iron and the latter by bolts.

Claim.—The truss B for cars or coaches, constructed by applying plate-iron to upright posts A A and belt-rail F, and the angle piece or portion C to the lower edge of the truss and to the sill E of the car, substantially as and for the purpose herein described.

143,499.—Scale-Pan.—John P. Chatillon, New York, N. Y. Application filed July 31, 1873.

A flange projecting downward, and doubled up, protects the enameled surface of the pan against shocks, and forms a support for the brackets of the ears.

Claim.—1. A scale-bottom provided with a downwardly-projecting flange, and coated with enamel, said flange serving to protect the enamel against blows when the scale-bottom is set down, as set forth.

2. The flange a on the scale-bottom A, being partially or wholly turned inward or doubled up to form a support for the corner of the scale-bottom, and for the brackets of the ears d, substantially as shown and described.

143,500.—Billiard-Table Ball-Holder.—Hugh W. Collender, New York, N. Y. Application filed July 9, 1873.

A ring-holder screwed into the end of the billiard-table serves to hold the fourth ball of the usual game while the players are engaged upon the French or three-ball game.

Claim.—The combination, with a billiard-table, of an annular ball-holder, arranged and adapted to operate substantially in the manner and for the purpose described.

143,501.—Toilet-Rack.—Oscar H. Cooke and Frank Kenfield, Morristown, Vt. Application filed October 21, 1872.

The brackets are connected near their upper ends by a shelf against which the towel-rack can be thrown up and form a guard

to said shelf. When the rack is dropped in position for use it is supported by stops placed on the inside of the brackets.

Claim.—As a new article of manufacture, the toilet-rack consisting of the brackets A, the fixed top shelf B, and the lower rack D E, provided with stops, and capable of being folded against said shelf B to act as a guard for articles placed on the latter, as and for the purposes set forth.

143,502.—Bolster Pillow, &c.—CHARLES P. COOPER, New York, N. Y. Application filed June 25, 1873.

The pillow or mattress is made hollow, with openings at the ends or sides to afford a circulation of air, and its open form is maintained by ribs of wood, metal, or whalebone, or by wire helices.

Claim.—A bolster, pillow, or mattress made hollow, with openings at the ends or sides to afford a circulation of air through it, and having its form preserved by ribs of wood, metal, or whalebone, or by wire helices, substantially as herein set forth.

143,503.—Manufacture of Watch-Chains and Bracelets.—WILLIAM C. EDGE, Newark, N. J. Application filed June 25, 1873.

Claim.—A chain for watches, bracelets, and similar articles, formed of woven-wire fabric bent and doubled, substantially as described and shown, for the purpose specified.

143,504.—Rotary Steam-Engine.—SAMUEL B. FRANK, Rochester, Mo. Application filed April 21, 1873.

The revolving cam or eccentric has a central valve and radial ports, and a packing-ring is fastened, by screws, in a semicircular manner to the cylindrical part of the cam, and is pressed out against the casing by springs. The piston-abutment is fastened to the wheel by a spring, which forces it against the casing. The sliding abutments are operated by springs secured to the framing.

Claim.—1. The eccentric C, constructed in the form shown, and provided with rings *d d* and follower *b*, and used in connection with casing A, sliding abutments I I, and springs h h, all substantially as and for the purpose specified.

2. The combination, with the eccentric C, of the valve G, pipe E, and collar and set-screw, constructed as shown and described, and for the purposes set forth.

143,505.—Binder's Attachment for Harvesters.—JOHN H. GARDHART, Madison, Wis. Application filed February 26, 1873.

The binder's seat and table are connected together, so that when the binder faces the grain-receptacle to receive the gavel the table passes under said receptacle.

Claim.—1. A binder's table and a binder's seat, connected to each other at different elevations, and arranged to swing upon the seat-standard, substantially as described, for the purpose specified.

2. In combination with the seat-standard, a swinging binder's table, arranged to be moved under the grain-receptacle, and to be swung outward from the same, substantially as described.

3. In combination with the seat-standard, a binder's table and seat, arranged to swing upon said standard, and adapted for adjustment with respect to each other, substantially as described.

143,506.—Fanning-Mill.—EDWARD M. GILBERT, Kasson, Minn. Application filed May 17, 1873.

Between the two principal screens are arranged two inclined boards and two sets of division-blocks for guiding the grain and refuse into separate receptacles.

Claim.—The screens A and B, boards D and E, division-blocks F, perforated blocks G, and trough C, all combined and operating together, as described.

143,507.—Heel-Burnishing Machine.—CHARLES W. GLIDDEN, Lynn, assignor to JAMES W. BROOKS, trustee, Boston, Mass. Application filed August 25, 1873.

A series of burnishing devices are attached to the links of an endless chain, which passes around a series of notched pulleys, the shoe being locked in such position in relation to the pulleys that the burnishers are brought into contact with the heel edge as they rotate.

Claim.—1. A boot and shoe heel burnishing machine having, in combination with a suitable mechanism for holding the boot or shoe in position, a chain or continuous series of burnishing devices, substantially as shown and described.

2. In combination with the burnishing-chain, the movable carriage *d*, substantially as described.

3. In combination with the burnisher-chain, the movable arms *s* and wheels *v v*.

4. The jack-carriage having the vertical swinging pin *s*, the tread-plate *t*, and the guide-block *f*, arranged substantially as shown and described.

5. In combination with the movable arms *s*, the mechanism for drawing them inward and forcing them apart, substantially as shown and described.

6. The method of burnishing the edges of boot and shoe heels by subjecting the curved edge to the continuous action of a yielding series of burnishing devices, substantially as described.

143,508.—Condensing-Tube for Spinning-Machines, &c.—JOHN GOOD, Williamsburg, N. Y. Application filed May 23, 1873.

The ring has a tapering channel in it, and the tendency of the spring is to keep the small end of the channel opposite the opening through the condenser. Variations in the size of the silver will cause the ring to turn until the opening through the condenser corresponds in size to that of the silver.

Claim.—The combination of the throat A, its controlling-plug B, and the spring S, or its equivalent, for controlling the opening in the throat, substantially as and for the purpose herein set forth.

143,509.—Pedal for Musical Instruments.—HENRY HAAS, New York, N. Y. Application filed July 23, 1873.

Claim.—A pedal for musical instruments made of cast-iron, provided with a bottom rim, *b*, and protected by a piece, *a*, of sheet metal, which may be nickel-plated, substantially as shown and described.

143,510.—Machine for Punching and Shearing.—SAMUEL R. HOUSER, Upper Sandusky, Ohio. Application filed August 16, 1873.

Claim.—1. In a combined punching and shearing machine, the frame B cast in one piece, as described, with the lip *a*, bed *b*, and head *d*, as and for the purposes set forth.

2. The combination of the punch D, lever E, arm H, and movable shear-blade I, as and for the purposes herein set forth.

3. The combination of the frame B, stationary blade C, punch D, lever E, arms G G and H, movable blade I, and gage J, all constructed and arranged substantially as and for the purposes herein set forth.

143,511.—Wheel for Wheelbarrows.—WILLIAM E. JACOBS, Columbus, Ohio. Application filed July 5, 1873.

The spokes are beveled at the inner ends and rounded at the outer ends.

Claim.—1. A wheel, the outer ends of the spokes B of which are rounded, as at *b*, and are of the width of the felloes, and fitted into notches *a*, which are scored out, as described.

2. The hub sections C C and tubular caps C′ C′, in combination with the bolt *g* and spokes B, substantially as described.

143,512.—Mode of Fastening Buttons.—WILLIAM A. JOHNSON, FRANK V. JOHNSON, and H. SMITH WORTH, of Oxford, Pa. Application filed February 15, 1873.

The plate or washer for the eyelet is made of sheet metal, and has its front edge turned over the cloth.

Claim.—The combination of the button, eyelet, and plate D, having a part turned over the front edge of the cloth, substantially as described.

143,513.—Hand-Car.—LOWELL H. KENYON, East Greenwich, R. I. Application filed August 2, 1873.

The levers are pivoted to the journals near the center, and extend nearly the entire length of the car, so that those working the levers can stand at the sides thereof.

Claim.—1. The cap B, having flanges A A, in combination with standards A and bolts *c c*, substantially as and for the purpose specified.

2. The longitudinal levers *b b*, in combination with the cap B having flanges A A, standards A, and bolts *c c*, all constructed and arranged as and for the purpose specified.

143,514.—Hose-Coupling.—WELLS KILBURN, Napa, Cal. Application filed March 10, 1873.

Two coupling-joints, one fitting over the end of the other, provided with suitable straps, which can be linked together when the joints are held at an angle; and when they are brought into line these straps draw the parts together so that they will fit and be held closely. A suitable packing is employed.

Claim.—A hose-coupling consisting of the sections A B, with their ends fitted as shown, and provided with the straps E I, with the pin H and corresponding slot J, respectively, and having the beveled shoulder at *h*, the whole constructed and operating as described.

143,515.—Seat for Carriages and Wagons.—CHRISTIAN K. LEHMANN, Savannah, Ohio. Application filed June 9, 1873.

One end of a torsional spring is secured to the under side of the seat, and the other end is attached to a link which connects with the steady-rod. The lower end of the rear torsional spring is hinged to the other end of the steady-rod.

Claim.—The combination of the torsion-springs C and the supporting steady-rods D with the links E, substantially as specified.

143,516.—Running-Gear for Railway-Cars.—JAMES S. LESTER, Atlanta, Ga., assignor to himself and ALVIN S. WORSHAM. Application filed August 1, 1873.

The car runs upon a single rail, whose cross-section is an isosceles triangle, the base forming the "tread." Each truck is mounted with five wheels, three of which run upon the upper surface of the rail, while two others bear against the inclined sides. The central upper wheel is grooved to fit an auxiliary rail upon the surface of the main rail. The brake acts upon the three upper wheels.

Claim.—1. The V-shaped main rail A, supported upon ties or posts B B, and provided on its upper surface, in the center, with an inverted-V-shaped metallic rail C, and with or without the side-edge plates *b b*, substantially as and for the purposes herein set forth.

2. A railroad-car truck provided with a center wheel, D, having a V-shaped circumferential groove, a smooth-faced wheel, E, at each end of the center wheel D, and a wheel, G, at each side underneath, all substantially as and for the purposes herein set forth.

3. The brake-block K, provided with projections *e* and *f f*, and used in combination with the wheels D and E E of a car-truck, as and for the purposes herein set forth.

4. The car-truck described, having a central wheel, D, adapted to run on the rail C, wheels E E, adapted to run on the upper surface of the main rail, and wheels G G adapted to run on the inclined sides of the rail, all substantially as and for the purposes herein set forth.

143,517.—Railroad-Ticket Holder.—JAMES C. MALOY, Johnstown, Pa. Application filed September 18, 1873.

A hinged frame, having a transparent front, is attached to the side of the car at the end of the seat. Tickets are held in position under the glass by an elastic cord. The frame is locked by a vertical spring-bolt operated at will.

Claim.—The combination of the hinged frame *a*, having a transparent front, *c*, a cord, *d*, for holding the tickets in position, and a locking-bar, *f*, for holding the frame closed, substantially as shown and described.

143,518.—Hoisting Apparatus.—GIDEON B. MASSEY, New York, N. Y., assignor to himself and ALFRED B. DARLING, same place. Application filed July 19, 1873.

The descent of the car is controlled by the rotary fluid-retarder, the amount by means of ropes or chains worked by the engine. The piston and cylinder, operating as an air or fluid stop, are combined with the traveling governor, actuated by contact with a bar for arresting the motion of the car in case of a too sudden descent from any cause whatever.

Claim.—1. The combination of a rotary inclosed fluid retarder, G, with the car or platform B, arranged to descend by gravity, and hoisting mechanism operated by the engine, substantially as specified.

2. In a rotary retarder applied to a hoisting apparatus, an abutment controlled by a spring, substantially as herein described.

3. The rotary fluid retarder G with its swinging abutment h and spring *k*, arranged for operation as described, in combination with the drum D, the lifting rope or chain C, the car or platform B, and the hoisting-drum E, operated by the engine during its travel in one direction only, substantially as specified.

4. The combination, with the drum D and lifting rope or chain C, positively or incidentally connected to the platform B, of the safety ropes or chains M, the rocking beam *l*, and the springs J J, essentially as and for the purposes herein set forth.

5. The piston and cylinder fluid stop L M, in combination with a governor, K, carried by the car, and mechanism, substantially as described, for actuating the governor, and causing it, when moving at an undue velocity, to couple the piston L with the car, essentially as and for the purpose herein set forth.

143,519.—Hoisting Apparatus.—GIDEON B. MASSEY and ALFRED B. DARLING, New York, N. Y. Application filed August 4, 1873.

Chains pass from the cross-trees of the car over pitched wheels connected with the shaft, upon which the fluid retarder revolves, and are attached to counter-balances moving on the side of the elevator-frame. As the car ascends the fluid retarder moves in common with its shaft; when the car descends the shaft of the retarder is locked by means of a pawl.

Claim.—1. The combination, with the car or platform arranged to descend by gravity, of one or more rotary fluid retarders connected with the car by safety ropes or chains, and in which the outer cylinder or case of either retarder is free to move in common with its piston when the car is ascending, but is locked from moving when the car is descending, substantially as and for the purpose herein set forth.

2. The combination, with the retarders, of counter-balances connected by chains with the car and pitched wheels on the shafts of the retarders, whereby the chains are made to operate the retarders, substantially as specified.

3. The safety-chains G^1 G^1 G^2 G^2, arranged in relation with the car as described, in combination with the centrally-pivoted cross-tree H and car or traveling platform B, essentially as herein set forth.

143,520.—Harrow.—DAVID B. MAIR, West Buffalo, Ohio. Application filed August 22, 1873.

A harrow constructed of two triangles hinged together and provided with reversible handles, supported by tubular standards and bolts.

Claim.—The harrow-frames A A, having the handles a^2 a^2, made reversible through the mechanism comprised of the screw-rods a^3 a^3, tubular standards or supports a^4 a^4, and screw-bolts and nuts, substantially as and for the purpose set forth.

143,521.—Machine for Wiring Blinds.—CHARLES MCGILL, New Haven, Conn. Application filed August 21, 1873.

The seats and rod are wired coincidently and together.

Claim.—1. The combination of the screw B with the bench A and table C of the machine, substantially as specified, whereby the machine is held to the bench, and provision made for adjusting it to suit different thicknesses of rods and widths of slats, as herein set forth.

2. The combination of the hollow screw B with the follower G, the stem *g*, the bench A, and the table C, essentially as shown and described.

3. The double spring staple-feeder K, in combination with the head-block D, provided with the shoulders *k k*, and the follower G, with its attached pair of drivers H H, substantially as specified.

4. The combination of the spring I, the band or cord J, and guide or pulley *i* with the dog or pawl A and stem *g* of the follower, whereby the same spring operates to feed the rack K and to return or lift the follower with its attached drivers H H, substantially as specified.

143,522.—Baker's Oven.—DUNCAN MCKENZIE, Brooklyn, N. Y. Application filed August 21, 1873.

Claim.—The additional external chimney D, the passages *b b*, and the dampers H I J, in combination with the fire-place and perforated oven bottom, the pin or arches K L, and the chimney C, the whole arranged to operate substantially as and for the purpose herein set forth.

143,523.—Carburetor.—WILLIAM T. MCMILLEN, Cincinnati, Ohio. Application filed February 24, 1873.

The float, through which air is conveyed to the hydrocarbon fluid, is arranged to rise and fall upon its surface by an angular jointed pipe arising from its top, connected with a horizontal pipe, which works, by its trunnion, in a bearing at one end, and at the other end fits over the end of a rigid supply-pipe.

Claim.—1. The air-reservoir D, jointed to the rigid supply-pipe by means of the angular pipes F G H and the trunnion I, turning in suitable bearings, substantially as described, for the purpose specified.

2. The angular pipe H, adapted to turn as the reservoir rises or falls by means of the trunnion I and its bearings, and the rigid angular pipe J, entering the end of said pipe H in line with the trunnion, substantially as described.

143,524.—Car-Coupling.—JAY A. MERRILL and DAVID W. KEMPTON, Denver, Colorado Ter. Application filed August 8, 1873.

The coupling-hook is held in position by a spring wound around the rod, by which it is uncoupled, and a step depends from the top of the thrust of the draw-head to protect the spring from the thrust of the link.

Claim.—1. The hook C, provided with the tapering slot or orifice *d*, in combination with the vertical rod D and spring G, substantially as described.

2. In a draw-head containing a pivoted hook to be operated by a spring-rod passing through the chamber, the step J, adapted to protect the spring G from the coupling hook or link, substantially as described.

143,525.—Steam-Heater.—PETER H. MERRILL, Pardeeville, Wis. Application filed June 21, 1873.

Water passes from the reservoir into the hollow grating, where it is converted into steam, which passes into the separator, whence it can be taken for heating purposes. A return-pipe from the hollow grating enters the reservoir above its exit-pipe. A partition parallel with the reservoir-cover inclosed an air-tight space. In this partition is a spring-weighted safety-valve.

Claim.—1. In a steam-generator for heating purposes, the hollow grating L, connected at both ends with the water-reservoir A, and near the steam-end with the steam-drum and separator M, substantially as specified.

2. In a steam-generator, the combination of a closed reservoir, A, with the partition B, the air-tube D, the spring-weighted safety-valve F, the pivot *f*, the lid E, the elastic packing D, and the exhaust-pipe I, substantially as specified.

3. In combination with the water-reservoir A, as described, the steam-drum or separator M, air and steam trap K, steam-pipes N, and hollow grating L, substantially as and for the purposes set forth.

143,526.—Railroad-Car Stove.—MARION MOONEY, TUNIS D. VAN DORN, and CHARLES C. WHITTENBERG, Edinburg, Ind. Application filed February 21, 1873.

The water-chamber is fastened to the car-floor, and is so made as to leave a space within its borders for the stove to be placed and fastened to the car-floor. A pipe extends from the water-chamber into the upper part of the stove to allow water to flow into the stove upon the fire, in case the car is upset.

Claim.—The shallow water-reservoir B, secured to the car-floor, and provided with an open space, into which the stove A is placed, and the elbow-pipe C, connecting the stove and the reservoir, all combined substantially as and for the uses set forth.

143,527.—Grain-Register.—GEORGE W. NESMITH, Metamora, Ill. Application filed February 7, 1872.

The tripping-lever of a tallying-register has a pivoted dog or pawl and spring so arranged as to complete its action upon the teeth of the first or unit wheel at the middle of its play, and thus secure the count of but a single tooth, whatever the throw of the lever.

Claim.—In a measure-register for grain, the arrangement of the unit-wheel and its stop-spring, the lever and its spring, and the pawl sliding between the springs and pivoted to the lever, substantially as specified.

143,528.—Manufacture of Felt-Cloth.—JAMES B. POLLARD, Norfolk, Mass. Application filed April 16, 1872.

Carded batts are first felted, then, instead of fulling, the material is pressed between hot calender-rollers.

Claim.—1. The process herein described, for the manufacture of felt-cloth, consisting in forming carded batts, treating them in a felting-machine, and subsequently subjecting the fabric thus formed to the action of heated calender-rolls, either plain or figured, so as to make the process of fulling unnecessary, substantially as specified, and for the purpose set forth.

2. The improved felted fabric herein described, produced by hot-calendering a felted batt, in the manner described.

143,529.—Electric Circuit and Device for Railway-Signals.—FRANK L. POTS, Elizabeth, N. J. Application filed June 11, 1873.

Signals at each end of a rail-section, controlled by relays,

whose batteries are opposed so as to normally neutralize each other, the entrance of a train on the section short circuiting each battery and rendering the relays operative, each relay closing two breaks normally in circuit of its signal magnets, and displaying signal at each end of section. Shows method, also, of limiting electric rail-circuit at switches.

Claim.—1. The combination of the following elements: Two batteries, B and B^1, so arranged as to oppose and neutralize each other, included in the same circuit, and placed at opposite ends of a section of railroad-track, one or more electro-magnets, S S^1, for actuating or controlling one or more visual or audible signals, and a circuit-closer, W or W^1, arranged to bring the said batteries simultaneously into action, and thereby cause said electro-magnet or magnets to operate said signal or signals, substantially as and for the purpose herein specified.

2. The combination, with the rails of a railroad-track, of two galvanic batteries, B B^1, arranged to neutralize each other until metallic connection is formed between the said rails, when two independent circuits will be established, substantially as and for the purpose specified.

3. The combination of the following elements: An insulated section of railroad-track, a relay, E^1, placed at or near one end of said insulated section of track, a secondary circuit controlled by said relay, and a magnet, S, situated at or near the opposite end of said insulated section of track, and arranged to operate or control the operation of a visual or audible signal, or both, substantially as and for the purpose herein specified.

4. The combination of the following elements: The battery E^1, signal-operating magnet S, circuit of conductors 13, 14, 15, 16, 17, 18, 19, and 20, and two independent circuit-closers, w and r^1, each under the control of a locomotive or train, the whole being so arranged that the magnet S can only be operated by the simultaneous action of both circuit-closers, substantially as specified.

5. The combination of the following elements: The insulated section of track a^6 a^8, the battery B^2, the relay M, the retaining-magnet N, and the insulated section of track a a^1, substantially as herein specified.

6. The combination of the movable rails of a switch with the double-acting circuit-changer *l* and the electro-magnets S and S^2, arranged to operate or control the operation of visual or audible signals, or both, substantially as herein specified.

7. The signal-operating magnet S, battery E^1, and circuit of conductors 26, 27, 28, 29, 30, 31, 32, and 33, in combination with the circuit-changer *l* and the circuit-breaker S^2, (either or both,) substantially in the manner and for the purpose specified.

8. The insulated section of track or other circuit-closer a^5 a^7, signal-operating magnet S^2, and battery D^4, in combination with the circuit-changer *l* and circuit-breaker r^2, (either or both,) substantially in the manner and for the purpose specified.

9. The combination of the insulated section of track a a^1 with a branch track or siding, insulated for a proper distance by means of breaks *b* b^1, or otherwise, for the purpose of confining the electric circuit to the main track, substantially as and for the purposes herein specified.

10. The combination of the insulated section of track a a^1, with a branch track or siding, provided with an insulating break, b^2, for the purpose of preventing an electrical connection between the opposite lines of rails of the said insulated section, substantially as herein specified.

11. The combination of the insulated sections of railroad-track A^2 and A^3 with the electrical conductors D or D^1, (either or both,) substantially as and for the purpose specified.

143,530.—Lubricator.—William A. Pratt, Baltimore, Md. Application filed August 26, 1873.

The rod carrying the lower valve is threaded part of its length; a correspondingly-threaded sleeve is secured to the upper part of the rod; the lower part of the sleeve forms the upper valve. These valves are adjustable and have their seats in the upper and lower ends of the stem which forms the supply-chamber.

Claim.—In a lubricator, the combination of the valve-rod D, sliding and adjustable sleeve D^1, having upper valve B, valve-seat *b*, and supply-chamber E, substantially as and for the purpose set forth.

143,531.—Gutting-Machine.—John Richards, Philadelphia, Pa. Application filed September 24, 1873.

The cutting-tool is made to travel across the material for cutting the gains.

Claim.—A wood-working machine to form notches, gains, and rabbets, organized and operating substantially in the manner and for the purpose hereinbefore specified.

143,532.—Tenoning-Machine.—John Richards and Lucius H. Berry, Philadelphia, Pa. Application filed September 24, 1873.

The material to be tenoned is not turned end for end, but slides endwise, having the gage-side always to the gage-board. The cutter travels down to cut one set of tenons, and upwardly to cut the other end.

Claim.—The tenoning-machine herein shown and described, when constructed, arranged, and operating in the manner and for the purposes substantially as specified.

143,533.—Railway-Rail Joint.—Tyree Rodes, Pulaski, Tenn. Application filed August 20, 1873.

Claim.—In combination with the rails A A^1, cut away at *b* b^1, as shown, the fish-plate B, adapted to grasp the feet of the rail, to support the web, and fill the recess formed in the rail by cutting away at *b* b^1, and the plate C, adapted to grasp the feet of the rails and support the web, as described.

143,534.—Carburetor.—Ira W. Shaler, Brooklyn, N. Y. Application filed March 20, 1873.

Consists in regulating the flame by controlling the amount of air admitted to the carbureting-chamber; also in placing the cotton, wool, or other absorbent material within a coil of wire, and then placing a number of these coils within a suitable-shaped wire-gauze frame in the carbureting-chamber.

Claim.—1. The regulating-valve *i* in combination with flues *g*, substantially as shown and described.

2. The wire-coil *c*, for holding the absorbent material, substantially as described.

3. The flues or passages *g* applied to a carburetor, as specified.

143,535.—Undermining-Auger.—Porter Sheldon, Jamestown, N. Y. Application filed September 8, 1873.

The double flanged twisted bar has along the outer edges of the helix cutters secured, which are so arranged that they overhang the concave surface of the twisted bar. The end of the bar is provided with a double-curved cutter.

Claim.—The combination of an auger with cutters arranged along either flange or spiral overhanging the concaves from the wrist to the point or end, and with the cutter at the end thereof, substantially as and for the purposes hereinbefore set forth.

143,536.—Game-Register for Cards.—Joseph W. Sheppard, New York, N. Y. Application filed May 24, 1873.

Within a suitable case a revolving disk, numbered so as to exhibit the state of the game through an aperture, is turned as required, by a projecting button operating an interior lever, while a connected disk, properly notched on its edge, causes a ball-hammer to strike at each change of the register.

Claim.—1. The instrument for registering the game of cards consisting of outer box A, main plates C C', button B with bifurcated lever F, slide *i*, and arm *m*, sectional plate D, screw *b'*, arm G with pawl H, face-plate and ratchet-wheel E E', ball I, and hammer L, substantially as and for the purpose described.

2. The button-shaft *c*, arranged to operate the plate D through arm *a'*, and plate E through lever F, slide *i*, screw *b'*, arm G, pawl H, and wheel E', substantially as set forth.

3. The face-plate E, in combination with the notched and recessed wheel E', revolving arm G, and pawl H, substantially as described.

4. The shallow notches *p*, arranged between the series of deep spaces in wheel E', to furnish bearing for pawl H, but not allow the ball to ring, as set forth.

143,537.—Ankle Supporter and Filler.—Samuel Silberschmidt, Baltimore, Md. Application filed September 25, 1872.

Claim.—As a new article of manufacture, a combined ankle-supporter and filler or pad, composed of stiff material and of a length and shape to fit both the rear and sides of the ankle and the calf—that is to say, made with an inwardly-curved and pointed lower part, and an outwardly-curved upper portion, substantially as and for the purpose described.

143,538.—Adjustable Ratchet-Rod.—Edward H. Smith, Worcester, Mass., assignor to R. Ball & Co., same place. Application filed August 21, 1873.

The screw-spindle is swiveled in a central fixed tooth, and has the direction of its thread reversed on the opposite sides of the fixed tooth, and the pitch of its thread increased for each tooth that is further away from the immovable tooth. By turning the spindle all the teeth will be moved to an equal degree of greater or less distance from each other.

Claim.—1. The screw-spindle B, provided with left and right hand screw-threads, in varying degrees of pitch, and connected with the immovable ratchet-teeth C, and with the movable ratchet-teeth D E and F G, for the simultaneous adjustment of the movable teeth with reference to their distances from the immovable tooth C, and from each other, substantially as specified.

2. The grooved and slotted bar A, in combination with the right-and-left threaded screw-spindle B, immovable ratchet teeth C, and movable ratchet-teeth D E and F G, all arranged to operate substantially as described.

143,539.—Composition Metal for Casting Plows.—George K. Smith, Waterloo, Iowa, assignor of one-half his right to George W. Miller, same place. Application filed April 8, 1873.

Scrap-steel, wrought-iron, and black oxide of manganese.

Claim.—A composition of scrap-steel, scrap wrought-iron, cast-iron, and black oxide of manganese, in the proportions enumerated, and prepared, mixed, and cast in the manner herein described, for the purposes specified.

143,540.—Attachment to Chimneys or Flues.—Jane Eliza Starnes, Worthington, Ind. Application filed July 19, 1873.

The tapering drum which extends into a room to be heated connects with the chimney at each end in such manner that the heated products of combustion pass through it. The inner wall of the drum is extended across the chimney-flue so as to deflect the ascending current into the drum. The drum is provided with a damper and a door to admit of cleaning.

Claim.—The curved tapering drum G, having the extensions *a a'* of its inner wall, the damper *b*, door *d*, and open ends *v v'*, the latter communicating, respectively, with the openings *n n'*, arranged one above the other in the chimney-wall, substantially as specified.

143,541.—Stove-Grate.—William H. Strieker, Syracuse, N. Y. Application filed August 2, 1873.

Claim.—The grate described, having the upper portion A, enlarged lower portion B, and connecting portion C, with intermediate draft-space E, substantially as and for the purpose described.

143,542.—Awning.—Henry Stern, New York, N. Y. Application filed September 12, 1873.

The shutters are placed at right angles to the window-frame and secured by hooks and staples. The shade or awning is adjusted to the inside of the shutters.

Claim.—1. The combination of the awning C with the blinds or shutters B B of a window, substantially as set forth.

2. The combination of the adjusting-hooks *a a*, staples *b b*, and braces *c c* with the awning C and blinds B B, arranged and operating substantially as and for the purpose herein described.

143,543.—Treadle.—Josiah Tibbals, John Putnam, and Horatio M. Allen, Norwood, Mass., assignors to Josiah Tibbals and John Putnam, same place. Application filed September 3, 1873.

Upon the journal of a stationary shaft is placed a sleeve, to one end of which the belt-pulley is secured, while upon the other end is formed a brake-wheel. Upon each side of the brake-wheel grooved pulleys, having friction-clutches to engage with the rim of the brake-wheel, are loosely secured. The pulleys are revolved by means of a wire encircling their grooved peripheries, the wire attached to a reciprocating and adjustable frame.

Claim.—1. The combination of the stationary shaft A, the frame H, the bands or wires G G', the chambered and grooved wheels F F', the furnished brake E E, springs *e e*, brake-wheel D, and its tubular shaft B, all constructed, arranged, and applied together substantially as and to operate as and for the purpose specified.

2. The screw L, yoke K, and arched slide I, combined and arranged, in manner as specified, with the frame H and the two wires G G', applied thereto and to the groove-wheels F F', as set forth.

143,544.—Seal-Lock.—James E. Thomson, Buffalo, N. Y. Application filed September 15, 1873.

A sliding plate, provided with a series of knives for canceling the stamp or seal, is arranged within the lock so as to be operated by the key in unlocking the bolt, and also by an arm attached to the hasp when the latter is opened.

Claim.—1. The sliding plate F, carrying a series of knives for canceling a stamp, in combination with the hasp B, provided with a suitable device for operating the same, substantially as and for the purpose set forth.

2. The dog E, in combination with the sliding knife-carrier, for withdrawing the catch C, and, at the same time, canceling the seal, substantially as and for the purpose set forth.

3. The hasp B, carrying the arm *b*, in combination with the oscillating dog E and traveling knife-carrier F for canceling the seal independent of throwing the bolt, as set forth.

4. The dog E, constructed with the sliding pin *i*, spring *n*, and stop *o o*, in combination with the arm *b* and knife-carrier F, all constructed substantially as described, and for the purpose set forth.

5. In a seal-lock, the arrangement of a vertically-sliding plate, F, carrying a canceling apparatus, and operated by a key or spring, so as to pass, in the act of unscalation, across a transparent portion of the lock case or face, in order that any mutilation of the stamp may be detected without opening the lock, substantially as set forth.

143,545.—Machine for Packing, Wrapping, and Labeling Tobacco.—John H. Townsend, New Haven, Conn. Application filed October 8, 1872.

The material is fed into an endless-band carrying-trough, passing under two rollers which leave the tobacco of a uniform depth. Two knives or combs are pressed down into the tobacco. One holds back the layer of tobacco, the other divides and drives forward a charge, forces it beneath a plate, and leaves it there. A plunger now descends and pushes forward the charge of measured tobacco into a receiver, which has already been automatically provided with a sheet of printed foil and a wrapper from a printing-press arranged at one side. One set of folding-knives then folds one end of the package, which is re-pressed and completed in another receiver by an additional plunger and another set of folding-knives.

Claim.—1. The combination of the endless-band carrying-trough and flange-box E' with rollers D and D', or their equivalents, by which the tobacco or other material may be packed into the said carrying-trough to a uniform depth.

2. The knife or comb F' and plate *b*, having such a motion imparted to them that they will convey the measured tobacco or other material beneath the plate *b'*, and, returning, leave the tobacco beneath the said plate.

3. The combination of the carrying-trough and plate *b'* with the plunger G, having such horizontal and vertical movements imparted to it that it will descend into the feeding-trough and force the measured tobacco from beneath the plate *b'*, all substantially as set forth.

4. The combination of the traversing feeding-trough, plate *b'*, and receiver H, into which the tobacco or other material is forced by the plunger G.

5. The folding-knife *s*, operating substantially in the manner described, in respect to the retaining folders m^1, m^2, and m^3.

6. The combination of the receiving-box M with the hinged door O.

7. The combination, substantially as herein described, with a machine for packing tobacco and other material, of a printing-press, whereby the required impression or impressions may be imprinted on the wrappers before the latter are fed to the packing-machine.

8. The combination, in a packing-machine, of the packing mechanism described, or its equivalent, and a machine whereby continuous strips of paper and foil are brought together, printed, cut, and fed to the folding mechanism, as set forth.

143,546.—Process of Treating Fibrous Substances for Paper-Pulp.—Albert Ulsemer, Pforzheim, Germany. Application filed October 1, 1872.

Wood, cut up into small pieces, is put into closed vessels, in which it is treated at a gradually-increasing pressure, and at a temperature corresponding to the same, with a caustic-soda lye, several times renewed and heated beforehand. The means for treating the wood under a gradually-increasing pressure in these same substances in the wood, which, in the beginning are dissolved at a comparatively low heat, are precipitated again at a higher temperature as insoluble matter.

Claim.—The process, herein described, of cooking, krivisting, and washing wood and other vegetable fibrous materials, by exposing the same in a cut or separated state, within a closed vessel or vessels, to the action of hot caustic-soda lye as a gradually-increasing pressure and temperature, several times repeated, substantially as specified.

143,547.—Extension for Stove-Flues.—Francis Warner, Troy, New York, assignor to Susan S. Huntington, same place. Application filed August 27, 1873.

The extension *d* of the flues *f* may be readily detached and a new one substituted therefor.

Claim.—1. The detachable piece or pieces that form the inner and top part of the descending flue or flues of a cook-stove, that may be put in position or replaced whenever desirable without removing the fire-pot or disconnecting the stove, substantially as and for the purposes described and set forth.

2. The combination of the detachable piece or pieces *d*, that form the top part of the descending flue or flues, with a fire-pot, C, and the descending flues *f*, substantially as and for the purposes hereinbefore described and set forth.

143,548.—Furnace for Tempering Castings, &c.—William M. Watson, Tuscon, Ill. Application filed August 9, 1873.

A jet of air or steam is admitted into the combustion-chamber to promote combustion and urge the draft, the current being deflected directly upon the rotary table by the pendent bridge. The annular pan, into which dips the flange of the rotary table, is filled with ashes to form a seal.

Claim.—1. The combination of the air or steam jet pipe or nozzle D with the fire-chamber B, reverberatory chamber E, and rotary tempering or hearth table G, substantially as described.

2. The annular ash-pan J, combined with the annular flange *e* and the rotary table G, substantially as described.

3. In a furnace for tempering castings, the reverberating chamber E, having an overhanging wall or deflecting bridge, *h*, which will direct the heated products downwardly upon the castings on the turn-table, substantially as described.

143,549.—Machine for Heading Rivets.—Joseph A. Wells, Waterbury, Conn. Application filed April 26, 1873.

The heading-plunger *d* and sleeve *r* are permanently fixed to the reciprocating cross-head A, while sleeve *b*, loose on the plunger and backed up by a spring, is held projected outward to center and steady the end of the wire to be headed until meeting die *c*, which stops its further movement, while the plunger still advances.

Claim.—In a heading-machine, the combination of the movable header-block A, sliding sleeve *b*, encircling the drive-pin *d* and having a collar-stop, *s*, the outer case *r*, having a corresponding interior shoulder, *t*, and spring *e*, all operating in the manner as shown and described.

143,550.—Locomotive Head-Light.—William Westlake, Chicago, Ill. Application filed August 21, 1873.

In order to facilitate the lighting or trimming of locomotive head-lights during high winds or while the locomotive is in motion, the lamp and reflector is mounted rigidly on a platform, which revolves horizontally, bringing the lamp before an opening in the outer case, out of the direction of the wind. This opening has an elastic cover, slitted for the passage of the hand, and while, closing around the wrist, prevents ingress of wind to the lamp.

Claim.—1. The revolving platform I, supporting and carrying the lamp and reflector within and independently of the outer case of a locomotive head-lamp, provided with a suitable door or opening to allow access to the interior, substantially as and for the purpose specified.

2. In a locomotive head-light, the elastic or yielding covering E for filling the space between the arm and the boundary of the hand-hole, substantially as and for the purposes set forth.

143,551.—Automatic Gate.—Edward P. Wheeler, Corinth, Miss. Application filed September 9, 1873.

The rear cord, which passes half around the head-post and thence through an eye to the latch-cord, operates the gate by pulling the hand-levers. The inner cord passes to the front of head-post and directly through the eye to the latch-cord, and operates the gate by pushing the hand-levers. The gate is thrown open in either direction.

Claim.—The arrangement of the cords P P' and M M' in front of the gate-post A, with the hand-levers K K', head-pcss O, latch-cord Q, and latch H, for opening and closing the gate in either direction, as herein specified.

143,552.—Stop Mechanism for Looms.—Henry F. Wheeler and William O. Wakefield, Boston, Mass., assignors to themselves and George Allen, same place. Application filed April 5, 1873.

At each end of the lathe is pivoted a detecting-finger, and when the weft fails each presses down a lever in a socket in the

lathe, causing one of the levers to strike the knocking-off lever. These rocker-levers are connected by a shaft so that the depression of either will stop the loom. The detector and rocker-lever are so constructed that the latter is held up in normal position by the fingers as long as the weft is present. A sliding pin in the lathe holds up the detector until pressed back by striking the cloth-beam at the beat-up, when the detector is released and allowed to fall and feel for the weft. To the detector is pivoted a swing-finger extending down in front of the lathe to prevent the picks, already beaten up, from falling back upon the lathe, and also yielding to let the last pick by as the lathe starts back.

Claim.—1. The arms *g*, levers *n*, and pins *i*, constructed and arranged to operate substantially as shown and described.

2. In combination with the arms *g*, and pivoted thereto, the fingers *a*, operating substantially as and for the purpose set forth.

142,553.—Sofa-Bedstead.—SAMUEL M. WEIS and SYLVESTER A. WEIS, San Francisco, Cal. Application filed May 17, 1873.

The main frame and secondary frame and the two head-pieces are all hinged together, and when it is desired to change the position of the folding-frame and head-piece a cord is drawn, which operates a lever under the main head-piece and releases a catch so that the hinged head-pieces can drop to a horizontal position, when the frame can be folded or unfolded.

Claim.—In a bed-lounge, the secondary head-piece A', head-piece A, and folding frame B', attached together as described, in combination with the lever F and its connections, as described.

142,564.—Slide for Extension-Tables.—ALFRED ZEH, GEORGE P. LIVINGSTON, and PETER V. W. CULLINGS, Gallupeville, N. Y. Application filed March 21, 1873.

The sliding rails are constructed with grooves, having iron rods laid therein, said rods being fastened at their ends. Nuts are attached to the opposite face of each consecutive rail that slides on said rods.

Claim.—The slide-rails A B constructed with grooves *a a*, and the rods D D laid therein, substantially as shown, combined with the sliding nuts E E, each moving on the rod D of the opposite rail, as and for the purpose set forth.

REISSUE PATENTS.

5,586.—Concrete Pavement.—GEORGE BASSETT, Syracuse, N. Y., assignee of one-half interest to THOMAS G. BASSETT.—Patent No. 132,630, dated October 29, 1872. Application filed August 16, 1873.

The joints are made of calcined plaster, so that they will yield readily when the blocks are to be removed for repairs or from other causes. The joints are also made wider at the bottom than at the top, to facilitate the removal of the blocks.

Claim.—1. The concrete-pavement blocks A, united with joints B of calcined plaster, substantially as specified.

2. The method of constructing the joints of calcined plaster or other cement by plastering it on the edges of the concrete blocks under a projecting straight-edge so as to gage both the height and width of the joint of cement, substantially as specified.

3. The joint B, made thicker at the bottom than at top, as and for the purpose specified.

5,587.—Car-Coupling Attachment.—WILLIAM G. BROWN and JAMES W. JEDKINS, Monmouth, Me.—Patent No. 135,202, dated January 28, 1873. Application filed July 23, 1873.

A bail for guiding the link of one car, having arms arranged so as to receive and guide the link of an approaching car.

Claim.—The combination of the draw-bar B, the bail E, provided with inclined arms M and a device for actuating the bail E, to operate together substantially in the manner and for the purpose set forth.

5,588.—Speaking-Tube.—CHRISTIAN A. FREDERICKS, Brooklyn, N. Y.—Patent No. 135,421, dated February 4, 1873. Application filed August 21, 1873.

A plate or piston at the end of the speaking-tube, just above the mouth-piece, is connected by a wire to an external plate, so as to indicate to the eye, by its position, when the tube has been blown into from the opposite end. The seat of the hinged whistle is so inclined that the whistle will fall freely into place, and be so held firmly by gravity when not raised by hand.

Claim.—1. The indicator composed of the plate I, rods J J, and plate K, in combination with a speaking-tube, substantially as shown and described.

2. The arrangement of the inclined valve-seat D, in combination with the flat interior sides of a speaking-tube, whereby the valve, closing by weight, is guided by said interior sides of the tube, substantially as shown and described.

5,589.—Apparatus for Grooming Horses.—JOHN JAMES GREENOUGH, Syracuse, N. Y.—Patent No. 118,449, dated August 29, 1871. Application filed January 24, 1873.

A jointed arm or axes united by couplings or gearing, connecting the driving power with a revolving cylindrical brush, sponge, rubber, cloth, or other tool.

Claim.—A grooming-machine whose main driving-wheel, or shaft to which the motor is applied, is connected to the brush by means of a jointed connecting rod or shaft, constructed of such parts and proportions as to permit the tool to be applied readily to the animal, as set forth.

5,590.—Combined Water-Wheel and Sewing-Machine.—ISAAC HYDE, Oakland, assignor to OSCAR J. BACKUS, San Francisco, Cal. Patent No. 131,616, dated September 24, 1872. Application filed June 5, 1872.

The wheel is applied to the driving-shaft of the machine, and is inclosed in a case, the lower part of which is formed so as to carry off the water as rapidly as it falls from the wheel. The supply of water is regulated by a cock, to which a pedal is attached for operating it.

Claim.—1. In combination with the water-wheel C and pipe *e*, the cock *g*, with a horizontal operating-rod, h, and foot-lever or pedal I, substantially as and for the purpose described.

2. The pocket D', constructed to receive water falling from the wheel C on both sides of the plane *y y*, substantially as described.

3. The driving-shaft B, connected with a needle-bar at one end, and carrying on its opposite end an inclosed water-wheel, substantially as described.

4. The treadle-cock *g* and base-board A^2, applied to a sewing-machine table, and so as to be movable with it, substantially as described.

5. A rotary motor consisting of a water-wheel and its casing, sustained both by the frame or table of the sewing-machine and by a shaft of the operating mechanism of said machine, substantially as described.

6. A vertically-revolving water-wheel, in combination with an inclosing-case, which has a projecting spent-water pocket, D', to prevent the spent water from acting upon the wheel, substantially as described.

5,591.—Bed-Bottom.—ANDREW TURNBULL, New Britain, Conn. Patent No. 126,436, dated June 25, 1872. Application filed June 6, 1873.

The bed-bottom is formed of diamond-shaped links, each of which, with hooks at its angles for connection, is one rigid piece.

Claim.—1. As a component part of a bed-bottom, a diamond-shaped link made of one piece, and provided with means of connection to the next adjacent link, substantially as described.

2. A bed-bottom composed of a succession of diamond-shaped links, each joined to the next longitudinal and transverse links by a rigid or non-elastic connection at the angles of the said links, substantially as described.

5,592.—Envelope.—RICHARD K. KUHN and THOMAS O. ATKINSON, Doylestown, Pa.—Patent No. 135,819, dated February 11, 1873. Application filed September 24, 1873.

One end is cut and folded to form an angular projection from the main pocket, which extension may be torn off without injuring the contents of the envelope.

Claim.—An envelope having one or more angular projections in continuation of the main pocket, adapted to be torn or cut off to open the package without injuring the contents of the latter, substantially as described.

5,593.—Suspender.—THOMAS O. POTTER and JOSEPH W. SMITH, Boston, Mass., assignors to THE BAY STATE SUSPENDER COMPANY.—Patent No. 116,093, dated June 21, 1871. Application filed February 26, 1873.

The shoulder-straps are connected by a cross-piece adjustable upon them lengthwise by means of a metallic sliding loop.

Claim.—1. A suspender and shoulder-brace combined, consisting of the shoulder-straps A A', the dorsal strap B, and the connecting-straps D D', when the front ends of the shoulder-straps are free, and when the dorsal strap is connected to each of the shoulder-straps at C, and also by means of connecting-straps D D', the whole being substantially as described.

2. The combination of the shoulder-straps A A', and dorsal strap B, when united together at C, with the connecting-straps D D' and their attachments E F F', whether these connecting-straps be adjustable or not, the whole arranged and operating substantially as described.

3. The combination of two straps, A and D, and the sliding loop F, substantially as described.

4. A strap, D, in combination with the devices F, each consisting of a loop united to a slide, and one at each end of the strap, as above described.

5,594.—Carving-Machine.—BENJAMIN J. TAYMAN, Philadelphia, Pa.—Patent No. 126,904, dated May 21, 1872; antedated May 8, 1872. Application filed August 4, 1873.

The arms D and D', having yokes transversely arranged and connected by loose screw-joints, admit of motions in every direction.

Claim.—1. The combination of the rods D and D', yokes E, E^1, and E^2, and joint-pins G and G', and wrist-joint b', for giving a shoulder-and-elbow movement, substantially in the manner and for the purpose above described.

2. The combination of the cutter-stock H, rod D', yoke E^2, joint-pin G', and wrist-joint b', substantially as set forth.

3. The combination of the sheaves *u*, *u*, *u*, and *u*, with the cutter-stock H, hand T, and bar D', having the movable wrist-joint b', for holding and guiding the hand, so as to keep it in line with the sheaves E^1 and E^2 during the lateral turning of the cutter-stock, substantially as specified.

INDEX OF INVENTIONS PATENTED OCT. 7, 1873.

	Class No.	Whole No.
Ankle supporter and filler, S. Silberschmidt	16	143,537
Auger, underreaming, P. Sheldon	124	143,535
Awning, H. Sykes	103	143,542
Axle, vehicle, T. F. Coleman	31	143,436
Bayonet socket, B. Burton	55	143,465
Bed bottom, A. Turnbull, (reissue)	68	5,591
Bed bottom, spring, Ames and Frost	68	143,327
Bedstands, &c., fastening for, J. M. Baird	68	143,431
Bedstead, sofa, S. M. and S. A. Winn	68	143,553
Bellows for furnaces, operating, H. Crumlish	19	143,439
Belt fastening, P. Sulzt	61	143,474
Billiard table ball holder, H. W. Callender	103	143,540
Blinds, machine for wiring, C. McGill	99	143,531
Bolster, pillow, &c., C. P. Cooper	68	143,528
Boot jack, F. Dorsett, &c.	16	143,403
Bullet, Rein and Stock	105	143,419
Burial case, J. B. Cox	29	143,439
Buttons, fastening, Johnson and Worth	23	143,519
Car coupling, A. W. Bohaker	122	143,491
Car coupling, Merrill and Kempton	122	143,524
Car coupling, S. A. Otis	122	143,529
Car coupling, J. B. Tracy	122	143,480
Car coupling attachment, Brown and Jedkins, (reissue)	122	5,587
Car, hand, L. H. Kenyon	121	143,513
Car lamp, J. L. Howard	90	143,511
Car running gear, railroad, J. S. Lester	120	143,516
Cat, stock, T. J. McCarty	121	143,414
Car stove, Mooney, Van Dorn, and Winterberg	154	143,532
Carburetor, W. T. McMillen	57	143,523
Carburetor, L. W. Shaler	57	143,534
Carriage, child's, H. M. Richardson	31	143,427
Carriage and wagon seat, C. K. Lehmann	31	143,515
Carving machine, B. J. Tayman, (reissue)	173	5,594
Chimney or flue attachment, J. E. Starnes	154	143,540
Chisel, C. E. L. Jolliffe	30	143,413
Cloth, manufacture of felt, J. E. Pollard	37	143,526
Coach and car trues, G. F. Chalender	121	143,490
Commode, J. D. Averell	6	143,488
Corset, J. Waterman	30	143,479
Corset clasp, J. Burke	30	143,493
Curtain fixture, H. H. Burritt	62	143,494
Dyeing, mordant for, G. A. Hagaman	35	143,449
Electric circuit and device for railway signals, F. L. Pope	50	143,529
Engine, rotary steam, S. B. Frank	150	143,504
Envelope, Kuhn and Atkinson, (reissue)	140	5,592
Feather renovator, R. B. Cooper	68	143,437
Fence, wood, R. F. Ward	58	143,478
Fire arms, attaching cartridge magazine blocks to, H. Metcalfe	55	143,415
Fountain and aquarium, J. Moore	167	143,456
Furnace, blast, R. B. Andrews	85	143,487
Furnace, cupola and other, L. Quincke	85	143,463
Furnace for tempering castings, &c., W. M. Watson	85	143,548
Furnace, hot air, O. S Kelsey	154	143,453
Furnace, tire heating, J. G. Rogers	60	143,465
Furnaces, operating bellows for, H. Crumlish	19	143,439
Gaining machine, J. Richards	113	143,531
Game register for cards, J. W. Sheppard	14	143,536
Gas machine, portable, B. Sloper	58	143,466
Gate, automatic, E. P. Wheeler	28	143,551
Gate, farm, W. S. Brown	28	143,493
Grain register, G. W. Nesmith	42	143,567
Hammers, die for forging, T. Daffin	60	143,406
Harrow, D. R. Mase	75	143,860
Harvesters, binder's attachment for, J. H. Garnhart	74	143,505
Heater, steam, P. H. Merrill	147	143,525
Heel burnishing machine, C. W. Glidden	16	143,507
Hemmer, O. L. Brown	134	143,433
Hoisting apparatus, G. B. Massey	79	143,518
Hoisting apparatus, Massey and Darling	79	143,519
Hook, sliding, P. J. Coon	99	143,436
Horses, apparatus for grooming, J. J. Greenough, (reissue)	144	5,589
Horses, device for attaching, S. Sykes	31	143,428
Hose bridge, E. Bateel	61	143,400
Hose coupling, W. Kilburn	61	143,514
Inking apparatus, F. L. Bailey	117	143,469
Knitting machine, L. D. Sanborn	69	143,498
Ladder, fire escape, G. Pfleeger	79	143,462
Lamp, F. Kampfe	90	143,452
Lamp, car, J. L. Howard	90	143,411
Lantern, signal, I. W. Shaler	90	143,425
Leather skiving machine, G. Andrews	98	143,308
Leather straps, machine for waving or embossing, D. H. Unger	98	143,477
Liquids, apparatus for freezing, S. S. Fitch	58	143,446
Lock, coal, T. E. Thomson	98	143,544
Locomotive head light, W. Westlake	90	143,550
Loom stop mechanism, Wheeler and Wakefield	52	143,533
Lubricator, W. A. Pratt	67	143,530
Lubricator, J. Ross	67	143,468
Matter, treating refuse, C. Whittier	98	143,488
Medical compound, J. P. Barnett	98	143,399
Medical compound, F. Sottnel	98	143,467
Metal for casting plows, composition, G. K. Smith	38	143,539
Mill, fanning, E. M. Gilbert	139	143,506
Musical instruments, pedal for, H. Haas	115	143,509
Nail extractor, G. J. Capewell	30	143,496
Ore, &c., apparatus for separating, H. Bradford	3	143,492
Oven, baker's, D. McKenzie	6	143,398
Paper pulp, treating fibrous substances for, A. Unger	106	143,546
Pavement, concrete, G. Bassett, (reissue)	110	5,586
Picture frame, F. Reifschneider	54	143,464
Picture holder, stereoscopic, Samson and Smith	137	143,467
Pitman, J. Swan	67	143,475
Planter, corn, R. R. Henegan	138	143,499
Plow carriage, H. M. Bullet	114	143,434
Press, book holding, L. Heithamp	15	143,410
Privies, sinks, &c., apparatus for cleaning, R. R. Estowsky	118	143,439
Pulley block, A. S. Dickinson	79	143,441
Punching and shearing, machine for, S. R. Houser	119	143,510
Punching sheet metal, machine for, M. Stephens	119	143,473
Purifier, middlings, Bandom and Wiggin	97	143,490
Railroad rail joint, T. Rodes	139	143,533
Railroad signal, W. Wickersham	139	143,552
Railroad ticket holder, J. C. Maley	146	143,517
Railroad tie, P. S. Devlan	139	143,497
Railroad time signal, G. B. Cummings	139	143,495
Ratchet rod, adjustable, E. H. Smith	67	143,538
Rein holder, E. Fahrney	34	143,500
Rivets, machine for heading, J. A. Wells	14	143,549
Roofing, sheet metal, R. A. Smith	136	143,471
Sad iron, B. Jones	91	143,451
Saw set, T. E. Grimes	131	143,447
Scaffold pole clamp, Haering and Alles	39	143,448
Scale pan, J. P. Chatillon	138	143,489
Screws, machine for making metal, N. C. Hubbell	171	143,512
Separator, middlings, R. L. Downton	97	143,442
Sewing machine, combined water wheel and, I. Hyde, (reissue)	134	5,590
Sewing machine ruffling or plaiting attachment, A. Rusk	134	143,494
Shears, A. Lapham	44	143,454
Shoe fastening, Fitch and Jones	16	143,445
Shutter fastening, A. J. Palmberg	94	143,460
Shutter worker, L. Muller	94	143,416
Slag, iron, &c., apparatus for granulating, C. Wood	86	143,486
Slaughtering apparatus, M. Brenner	86	143,491
Soap, putting up alkalies for making, J. W. Wyld	36	143,480
Spinning machines, &c., Condensing tube for, J. Good	148	143,502
Stamp, ore, L. D. Webb	3	143,499
Staves, machine for cutting gores in, C. Ruggles	40	143,466
Stove, car, Mooney, Van Dorn, and Winterberg	154	143,532
Stove flues, extension for, F. Warriner	154	143,547
Stove grate, G. W. Hitchcock	154	143,443
Stove grate, W. H. Stryker	154	143,541
Stove platform, C. Brownell	154	143,488
Streets of snow, machine for clearing, R. A. Shinn	110	143,470
Suspenders, Potter and Smith, (reissue)	36	5,593
Tables, slide for extension, Zeh, Livingston, and Cullings	68	143,564
Teeth, artificial, W. C. Tracy	46	143,476
Teeth, device for retaining fillings in, E. Osmond	46	143,458
Tenoning machine, Richards and Berry	173	143,535
Tobacco, machine for packing, wrapping, and labeling, J. H. Trowbridge	160	143,545
Toilet rack, Cooke and Kenfield	6	143,501
Toy device for making soap bubbles, A. B. Bliss	143	143,432
Toy gun, E. Y. Murphy	143	143,457
Trap, fly, C. S. Rouse	143	143,462
Treadle, Tisdale, Putnam, and Allen	87	143,543
Tub support, wash, G. F. Shaw	91	143,469
Tube, speaking, C. A. Fredericks, (reissue)	153	5,588
Vehicle coupling, C. H. Orator	31	143,424
Vehicle wheel, M. B. White	31	143,481
Vessels, forcing ashes from, J. Palmer	149	143,461
Vessels, propulsion of, G. B. DeBoucherville	139	143,440
Washing machine, dish, C. H. Williams	69	143,484
Watch chains and bracelets, manufacture of, W. C. Edge	96	143,502
Watchmaker's lathe, J. M. Oram	38	143,422
Wheel for wheelbarrows, W. E. Jacobs	31	143,511
Whip socket, F. B. Munroe	73	143,417
Winding machine, cop, Chadwick and Lowndes	35	143,497
Wire, machine for painting, F. H. Aiken	170	143,482
Wood, &c., apparatus for graining, C. Falke	107	143,444
Wood, compound for painting and coating, Snow and Davis	107	143,472
Wood splitting machine, D. Milliken	174	143,455

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED OCT. 7, 1873.

Aiken, F. H., Machine for pointing wire	143,482
Allen, G., assignee	143,502
Allen, Tisdale, and Putnam	143,543
Alles and Haering	143,448
Ames, C. L., and A. H. Frost, Spring bed bottom	143,327

Cummings, G. B., Railroad time signal	143,405
Curtiss, E., assignee	143,496
Dadin, T., Die for forging hammers	143,406
Dasting, A. B., assignee	143,518
Dasting and Massey	143,519
Davis and Snow	143,472
De Bescherville, G. B., Propulsion of vessels	143,440
Deubler, J. G., assignee	143,497
Devlin, P. S., Railroad tie	143,407
Dickinson, A. S., Pulley block	143,441
Dorsett, F., Sr., Boot jack	143,408
Downton, R. L., Middlings separator	143,442
Edge, W. C., Manufacture of watch chains and bracelets	143,503
Edwards, A., assignee	143,430
Eisenhaed, G. W., Stove grate	143,443
Fahrney, E., Rein holder	143,409
Falke, C., Apparatus for graining wood, &c.	143,444
Fitch, G. L., and H. M. Jones, Shoe fastening	143,445
Fitch, S. S., Apparatus for freezing liquids	143,446
Frank, S. R., Rotary steam engine	143,504
Fredericks, C. A., Speaking tube, (reissue)	5,568
Frost and Ames	143,397
Gearhart, J. H., Binder's attachment for harvesters	143,505
Gerhardt, W., assignee	143,443
Gilbert, E. M., Fanning mill	143,506
Glidden, C. W., Heel burnishing machine	143,507
Good, J., Condensing tube for spinning machines	143,508
Greenough, J. J., Apparatus for grooming horses, (reissue)	5,569
Grimes, T. E., Saw set	143,447
Haas, H., Pedal for musical instruments	143,509
Haering, H., and H. Allee, Scaffold pole clamp	143,448
Hagaman, G. A., Mordant for dyeing	143,449
Hahlkamp, L., Bookholding press	143,410
Hanagan, E. E., Corn planter	143,450
Hinks, C. S., assignee	143,460
Hosmer, S. E., Machine for punching and shearing	143,510
Howard, J. L., Railroad car lamp	143,411
Hubbell, N. C., Machine for making metal screws	143,412
Huntington, S. S., assignee	143,547
Hyde, L., Combined water wheel and sewing machine, (reissue)	5,590
Jacobs, W. E., Wheelbarrow wheel	143,511
James, A., assignee	143,457
Jedkins and Brown, (reissue)	5,567
Jolliffe, C. E. L., Chisel	143,413
Johnson, J., assignee	143,412
Johnson, W. A., and F. V. and H. S. Worth, Fastening buttons	143,512
Johnston Rattler Company, assignee	143,424
Jones, B., Sad iron	143,451
Jones and Fitch	143,445
Kample, F., Lamp	143,452
Kelsey, O. S., Hot air furnace	143,453
Kempton and Merrill	143,524
Kenfield and Cooke	143,501
Kenyon, L. H., Head car	143,513
Kilburn, W., Hose coupling	143,514
Kobs, E. K., and T. O. Atkinson, Envelope, (reissue)	5,592
Leghorn, A., Shears	143,454
Lehman, C. K., Carriage and wagon seat	143,515
Leonard, O. W., assignee	143,454
Lester, J. S., Running gear for railway cars	143,516
Livingston, Cullings and Zeb	143,554
Lownds and Chadwick	143,497
Maloy, J. C., Railroad ticket holder	143,517
Maltby, D. F., assignee	143,406
Marsh, P. J., assignee	143,408
Massey, G. B., Hoisting apparatus	143,518
Massey, G. B., and A. B. Dasting, Hoisting apparatus	143,519
Mase, D. B., Harrow	143,389
McCarty, T. J., Stock car	143,414
McGill, C., Machine for wiring blinds	143,521
McKenzie, D., Baker's oven	143,393
McMillan, W. T., Carburetor	143,523
Merrill, J. A., and D. W. Kempton, Car coupling	143,524
Merrill, P. H., Steam heater	143,525
Metcalfe, H., Attaching cartridge magazine blocks to fire arms	143,415
Miller, G. W., assignee	143,539
Millikes, D., Machine for splitting wood	143,455
Mooney, M., T. D. Van Dora, and C. C. Winterberg, Railroad car stove	143,526
Moore, J., Fountain and aquarium	143,456
Mueller, F., assignee	143,463
Muller, L., Shutter worker	143,416
Munroe, F. B., Whip socket	143,417
Murphy, E. Y., Toy gun	143,457
Nesmith, G. W., Grain register	143,527
Oram, J. M., Watchmaker's lathe	143,458
Osmond, E., Device for retaining fillings in teeth	143,418
Otis, S. A., Car coupling	143,459
Palmberg, A. J., Shutter fastening	143,460
Palmer, J., Forcing ashes from vessels	143,461
Parker, C., assignee	143,406
Pfeeger, G., Fire escape ladder	143,462
Pollard, J. E., Manufacture of felt cloth	143,528
Pope, F. L., Electric circuit and device for railway signals	143,529
Potter, T. O., and J. W. Smith, Suspenders, (reissue)	5,593
Pratt, W. A., Lubricator	143,530
Putnam, Allen, and Tisdale	143,543
Quincke, L., Cupola and other furnace	143,463
Reifschneider, F., Picture frame	143,464

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 16. TUESDAY, OCTOBER 14, 1873. PRICE { $5,00 per year—single. $4,00 per year in clubs.

The Official Gazette is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DIGEST OF FOREIGN PATENT LAWS.

PRUSSIA.

Report by Mr. T. N. Plunkett, of the British Legation.

The fifth paragraph of the fourth article of the Imperial Constitution of May 15, 1871, declares that questions concerning patents and patent laws are reserved to the Reichsrath, and are no longer to be dependent on the different governments which compose the German Empire. Nevertheless, no uniform legislation applicable to the whole of Germany has been as yet established.

On the 10th of May last a petition was presented to the Reichsrath requesting the Chancellor of the Empire to take advantage of this provision of the constitution, and to prepare a bill for introducing a general patent law for the whole empire. An animated and lengthy discussion then took place between the advocates of a patent system and its opponents, both of whom, however, agreed in recommending the petition to the notice of the government, on the ground that nothing could be worse than the existing state of things, and that a remedy of some kind was most urgent.

Dr. Banks, the reporter of the committee which had examined the petition, made use of the following strong expressions while recommending the house to adopt it:

"I think there is no authority in the Prussian State, not even that which is charged with the granting of patents, which is not of opinion that of all the systems of patent legislation the Prussian system is about the worst. . . . . Yes, gentlemen, there does not exist in this world a thing more motley and confused than the patent system of Germany. You have in Germany some states which, like Prussia, found their patent system on preliminary investigation, others which adopt the application system. You have some states—as, for instance, the palatinate of the Rhine—which have the most absolute form of simple application, as introduced in 1791 in the French Republic; in Alsace-Lorraine we have the modern French system; and, finally, we have also in Germany several states which, although possessing no legislation whatever respecting the granting of patents, nevertheless grant them all the same.

The inconvenience arising from this confusion has been keenly felt for years past. In the year 1868 an effort was made by the government of the North German Confederation to call the attention of the federal parliament to the matter. The message, however, of the chancellor, dated December 10, 1868, has so far produced no result, although it was freely alluded to in the course of the discussion, from which I have just made a quotation. In the meanwhile the confusion, which was found so intolerable, even before the creation of the empire, has been, of course, increased by the absorption of Bavaria, Würtemberg, Baden, and Alsace-Lorraine, with their different and contradictory legislations, into the common fatherland.

Matters of more thrilling and immediate interest have hitherto prevented the German Parliament from giving to the question of patents the attention which it deserves; but I have good reason to believe that it will again be mooted as soon as the Reichsrath reassembles, and that the government will again be urged to take steps for repealing all the existing laws on the subject, with a view to establishing a uniform and intelligible system of patent legislation in Germany.

The imperial government have not, as far as I am aware, compromised themselves by any direct expression of opinion in this matter.

The message, however, of 1868, although only professing to call the attention of the Reichsrath to the urgency of remedying the confusion in the existing patent arrangements of the North German Confederation, distinctly gave it to be understood that in their opinion the best solution of the question would be simply to abolish patents altogether.

Moreover, in the debate already mentioned, Switzerland and Holland—the two countries in which patents are not recognised—were frequently cited as examples, which it would be wise for Germany to follow.

It may therefore be expected that whenever the question is mooted again a very strong push will be made to induce the Reichsrath to settle it once for all, in a summary and conclusive manner, by repealing the various existing patent laws without passing any new one in their place.

Having offered these preliminary remarks upon patents in the German Empire, I will now proceed to give, as briefly as possible, a review of the principal points affecting the law and practice of the Kingdom of Prussia with regard to inventions.

The legislation of Prussia on these matters is based on a rescript of October 14, 1815, on various ministerial decisions as to the precise meaning of particular portions of it, which have been given from time to time when occasion arose; and also on the agreement come to in September, 1842, between the different States of the Zollverein respecting patents.

In the main, however, the practice in Prussia is as follows:

Patents can be obtained both for discoveries and for improvements; and also for the introduction into Prussia of inventions patented abroad.

New goods, new machines, new tools, and new modes of fabrication can be patented; but only on the condition that they are useful to industry and manufacture, and afford new means of industrial development.

Patents are never granted in Prussia for inventions of an artistic nature; the only excuse for a patent is that the invention shall have industrial value. No invention which is not entirely new, or which is not certain to be useful to industry, has a chance of receiving a patent, for the rules are administered with the greatest severity.

Articles or inventions patented abroad may also be patented in Prussia, provided, however, that no description of them shall have been published either here or elsewhere, and that no use shall have yet been made of the invention in Prussia.

This latter provision materially affects British inventors, and is a cause of constant vexation to them. Every patent which is granted in England is published with all its details in London in the official journal of the patent office. This, as well as every mechanical and industrial newspaper or periodical of any consequence published in the world, is regularly read at the department in Berlin, which is charged with the administration of the patent laws. This department subscribes to over one hundred such periodicals, the contents of which are carefully sifted, and the principal points entered into ledgers for future reference—an operation which I am assured by the director entails an enormous amount of labor on his subordinates.

When once the details of an invention have been published, either in Germany or elsewhere, officially or unofficially, before the application for the Prussian patent has been made in Berlin, it is invariably refused.

An article which is patented abroad may be patented in Prussia, if it fulfills the necessary requirements, by anybody.

No rights whatever are reserved to the original patentee, except in the case of patents taken out in other German countries.

Under the agreement concluded between the Zollverein States in 1842 when a patent has been given for an invention in any one of those States, it secures to the patentee the sole right of applying for a patent for the same article in all the other States of the Confederation; but it does not necessarily follow from this that the Prussian authorities will give patents in every case where other German governments have done so.

In Saxony, Bavaria, and Würtemberg, for instance, patents are much more easily obtained than they are in Prussia.

Patents are granted only to natives, or to the subjects of such countries as by treaty are entitled to most-favored-nation treatment. Therefore, under the treaty of commerce concluded in 1865, British subjects are entitled to take out patents in this country. Subjects of those foreign countries which are not entitled to most-favored-nation treatment, if they wish to patent their inventions in Prussia, must appoint a native as their representative, and have the patent made out in his name.

The application for a patent is made direct to the Minister of Commerce in Berlin, and must be accompanied by full descriptions, and, if necessary, also by models. These are, however, kept secret from everybody except from the persons whose special duty it is to examine and report upon them.

The applications are registered immediately on receipt at the ministry, and take their precedence accordingly.

Under the Ministry of Commerce is a special department called the Technical Deputation for Industrial Matters, to whom all these applications are referred. It is their duty to examine the models, descriptions, &c., to see whether patents for similar or kindred inventions have been already given, and to ask for any further explanations which they may require. They then decide absolutely and without appeal whether they will grant the patent or not. They fix the length of time for which the patent is to hold good, and have, moreover, the right of declaring whether they will give a patent for the whole invention or only for some portion of it.

This deputation consists, at present, of nine members, under the presidency of a director of the Ministry of Commerce, and meets once a week or oftener to examine the applications for patents which have been made to the minister.

Their verdict is communicated to the person who has applied for the patent, and he is allowed a period of six weeks to decide whether he accepts or not the conditions proposed by the deputation.

If he agrees to accept them, the patent is then issued under the signature of the Minister of Commerce.

The following conditions are invariably imposed in the case of every patent which is granted:

1. The patentee must give practical effect to his invention in Prussia within the time fixed by the minister, (usually six months, never more than a year,) on pain of forfeiting his patent; and he must produce before the end of that term an official certificate from the local police, or at least from some government employé, that his invention is or has been actually in work within the Prussian dominions.

2. If at any time during the period for which the patent is granted his invention shall have been unemployed during twelve consecutive months, the patentee shall forfeit all his rights.

3. The patent shall equally be forfeited if at any time afterward it can be proved that the invention was neither new nor original.

The period for which a patent is to run is laid down, specially for each case, in the rescript of the Minister of Commerce. The law is, that it shall not be less than six months nor more than fifteen years; but it is now usually fixed at three years.

A patent which is near expiring may, in some cases, be renewed; but the entire period for which it can last must never exceed fifteen years. Such prolongations, however, have lately been more difficult to obtain than they were formerly.

Unless in cases where the applicant himself demands a special exception, patents extend to the whole Kingdom of Prussia.

The publication of the fact of a patent having been granted to an inventor is made in the official journals free of cost. Merely the fact itself is mentioned of a patent having been granted for such a number of years to such or such a person, for such or such an invention. No details are entered into, and no description is given. The exact particulars of the invention are kept in sealed covers at the office of the Technical Deputation for Industrial Matters in Berlin; and, although in the patent commission itself there is a special proviso that the government do not guarantee secrecy, they practically never allow the secret to ooze out. It would indeed appear that everything connected with this department is conducted with the view of preventing the outside world from learning what takes place within its walls.

The expenses of taking out a patent in Prussia are almost nominal.

The application for a patent must be written on stamped paper, of 5 silber-groschen—say, 12 cents.

The answer of the Technical Deputation is given on stamped paper of 15 silber-groschen—say, 36 cents—and the patent itself, if granted, is liable to a stamp duty of 1 thaler—say, 73 cents. There is no further tax or duty whatever.

A patent can be sold or inherited like any other property, on condition, however, that the new proprietor shall be a Prussian, or a subject either of one of the Zollverein States or of a country entitled by treaty to most-favored-nation treatment. In these cases no notice need be given to the government, who always apply direct to the original patentee or his heirs.

Corporate bodies have the same rights as individuals in regard to the acquisition of patents.

A patent in Prussia gives to the patentee the exclusive right of working his invention—that is to say, the sole right of making the article in question; and also, in the case of machinery, the sole right of employing it when made. It does not give the right of prohibiting the sale or importation of articles which are like the article for which the patent has been obtained.

A patentee whose rights have been infringed can invoke the aid of the police to confiscate the pirated articles; but the offending party must be named before they can be seized; and it is only in case of a second offense that the articles in question can actually be confiscated. The decision in these questions lies, in the first instance, with the authorities of the "bezirk" (district,) with an appeal, in second instance, to the Minister of Commerce.

Claims for damages must be laid before the ordinary civil tribunal; and such claims may be made without the previous formality of a warning to the offending parties being required.

Patents which had been granted before 1866 by the Prussian Government, and by the former governments of Hanover, Hesse, Nassau, or Frankfort, and which have not yet expired, have force only in those special districts which at that time were under each of those governments; but all patents issued by the Prussian Government since 1866 have force throughout the whole monarchy as now constituted, unless in those few cases where, at the request of the patentee himself, a special reservation is made.

Through the kind intervention of the Imperial Department for Foreign Affairs, I have obtained the following return of the number of patents granted in Prussia since 1861.

A regular list of the applications for patents has been kept only since the 1st of April, 1870.

Return of the applications made and the number of patents granted.

Year.	Applications made.	No. of patents granted.
1861	No return.	102
1862	" "	74
1863	" "	71
1864	" "	69
1865	" "	64
1866	" "	60
1867	" "	103
1868	" "	83
1869	" "	63
1870	551 from 1st April.	74
1871	731	96
1872	817 up to middle of Nov.	Up to 1st November, 51

It will be seen from the above figures how very small is the number of patents annually obtained in Prussia; and, nevertheless, it is generally believed that this government would desire to grant fewer still, if possible.

Already, in a despatch dated August 5, 1863, the Prussian Government proposed to the Federal Diet at Frankfort to do away with patents altogether; and as the message of 1868, already alluded to, would tend to show that they had not altered their opinion in this respect, it would seem more than probable that ultimately the opponents of the patent system will obtain the solution for which they have so long contended.

In further corroboration of this desire on the part of the ruling authorities here, it is worthy of notice that a decree, dated the 13th ultimo, has lately been published, mitigating the amount of punishment to be inflicted for breaches of the patent rights in Alsace-Lorraine.

The patent system of that province still continues to be founded on the French law of July 5, 1844, hitherto in force there; but the penalties imposed by that law are abolished, and henceforth any breaches of the patent law will be punished only with the lowest punishment mentioned in the German criminal code.

All questions concerning the granting of patents in Alsace-Lorraine are henceforth to be settled directly by the President of the Province.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

FRANCIS B. RICHARDSON *vs.* HAMILTON D. LOCKWOOD.

[*Before Clifford and Lowell, Justices.—Decided August* 13, 1873.]

If a syringe has been previously known having a bulb with a screw upon it, by which a flexible tube could be attached to it, it is fatal to a patent which claims "so forming the connection between the bulb and its flexible tube that the bulb can be used separately with a jet pipe, as well as with its flexible tube, thus adapting the syringe to all the various operations for which it may be required, as described."

Even if those who made the prior syringe never thought of attaching a jet pipe to the bulb, that will not avail to save the patent.

Evidence of the prior use of the patentee's invention given by a witness who was not referred to in the answer, left out of consideration, although it might be said that it showed the state of the art.

[*Henry T. Fronk*, for complainant.
C. Austin Browne, for defendant.]

LOWELL, *J.*:

The claim of the plaintiff's patent, as reissued, is "so forming the connection between the bulb and its flexible tube that the bulb can be used separately with a jet pipe as well as with its flexible tube, thus adapting the syringe to all the various operations for which it may be required, as described."

This appears to be a very useful feature in a syringe, and it has been used by the defendant. The only question is, whether it is new. The patent is evidence of novelty, and there is little else in the case to prove it. On the other hand, it is testified by two witnesses for the defence that it has long been the habit of mechanics to connect tubes to bulbs by a screw, which is the mode adopted by the patentee. One of these witnesses, Mr. Shartle, testifies that syringes were made with a screw connection, by which different sorts of tubes could be attached to the bulb, and that they were in common use some years before the date of the complainant's invention. As, however, this witness was not referred to in the defendant's answer, some doubt may be entertained whether he can be relied on to support it. It may be said, in favor of admitting the evidence, that it merely shows the state of the art; but we think it safe to leave this piece of testimony out of consideration.

Our impression at the hearing was, that the Davidson syringe itself as made, and as described in the caveat, was an answer to the plaintiff's claim, and we are still of that opinion. But in order not to decide too hastily against the patent, and considering that if our ultimate opinion should remain the same the delay would not be injurious to either party, we have taken time, and have carefully examined again the evidence. We are satisfied that the opinion given upon the matter of fact in former suits between these parties, one of which was affirmed by the Supreme Court in 8 Wallace, 230, was sound, and that Davidson did make the precise form of syringe which he has always testified to, or, rather, that the two Davidsons made it; and that form includes a connection, by means of a screw, between the bulb and the tubes.

It may that the Davidsons did not perceive all the advantages which this mode of connection would give to a syringe. In their caveat they seem to consider that the chief value of making the syringe in parts is, that it may be easily cleaned and dried. But if they made the syringe, for whatever purpose, in this way, it seems to us they can allege that no one else is entitled to a patent for making one in that way. If, therefore, the proof is not clear and distinct that this feature was a matter of common knowledge, still it seems to have been known to the Davidsons. The identical piece of metal which they made is sworn to, and we do not think the evidence has ever been discredited.

Bill dismissed with costs.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

[*In equity.—Before Shepley, Judge.—Decided August* 1, 1873.]

JOHN KENDRICK *vs.* THOMAS A. EMMONS.

The mechanism in a heddle-machine which gages the size of the loop, as described in Ellis and Sladden's English patent, No. 117, of 1864, is an infringement, when used in this country, of the patent granted to Joseph S. Winsor, January 2, 1855, and reissued to him and his assignees February 11, 1873.

[*B. F. Thurston* and *W. W. Swan*, for complainant.
A. K. P. Joy, for defendant.]

SHEPLEY, *J.*:

This is a motion for a preliminary injunction by the assignee of the reissued patent No. 5,292, dated February 11, 1873, for an improvement in machines for making weavers' harnesses, the invention of Joseph S. Winsor, of Providence. The defendants use machines constructed substantially in accordance with the English patent granted to James Ellis and Joseph Sladden the 12th day of July, 1864, dated the 15th of January, 1864, and numbered 117, for the year 1864. The original Winsor patent was dated January 2, 1855; extended for seven years, and reissued, as above stated, in 1873.

Infringement is claimed of the third, fourth, and eighth claims of the reissued patent. The two machines are each marvels of mechanical ingenuity and invention. As a whole the English machine is clearly not substantially the same as the Winsor machine in construction or mode of operation. The harness produced by the English machine is, as a whole, a substantially different manufacture from that produced by the Winsor machine. But in the Winsor machine there is described a device called fingers, which are located between the side bands to which the heddles are attached, the office of the fingers being to gage the size of the eye or loop of the harness. These fingers are two pointed rods of metal, around each of which a half knot is tied, and the size of the eye or loop is determined by the distance by which the fingers are separated from each other. The bifurcated plate in the English patent, as well as the two rods substituted for it, and performing the same office as the bifurcated plate, accomplish in substantially the same manner and for substantially the same purpose what is accomplished by the fingers operating in the Winsor machine to gage the size of the eye. As described in the English patent, this "fork then drops in betwixt the yarn on each side of the noose, and which sets and holds the noose to its proper size and position, until the yarn is again drawn out to the lappers." And in another place in the patent reference is made to "a recess which the fork takes hold of and retains it until another draw-out of the yarn is effected, and another noose is formed in like manner, and so on."

The two machines were operated in the presence of the court, and from inspection of the respective machines in operation, the court is of opinion that the device in the English patent, which is described as a fork, bifurcated plate, or retainer, is an infringement of the third claim in the Winsor patent, which claims "the fingers located between the side bands and operating to gage the size of the eye." As this device in the English machine is used in combination with mechanism which operates to tighten or draw up the twine, out of which the next heddle is formed, the fourth claim of the reissued patent is also infringed.

Injunction to issue, unless defendant will give bond to account for such profits and damages as may be ascertained by final decree, and render into court the usual account of manufacture and sales.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,590.—Defecating and Clarifying Cane-Juice.—Granted to RICHARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 3, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

23,697.—Fastening Metal Hoops on Cotton-Bales.—Granted to JOHN T. BUTLER, November 15, 1859. Application filed August 7, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

23,698.—Machines for Folding Paper.—Granted to CYRUS CHAMBERS, Jr., November 15, 1859; and reissued August 12, 1873. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

23,697.—Electro-Magnetic Telegraphs.—Granted to MORSE G. FARMER, November 15, 1859; and reissued December 10, 1872. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

23,126.—Billiard-Table Cushions.—Granted to GEORGE D. SHARP, November 15, 1859; and reissued April 8, 1873. Application filed August 16, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

23,135.—Portable Pumps.—Granted to WILLIAM T. VAIL, November 15, 1859; reissued February 26, 1861. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

23,136.—Mode of Advertising.—Granted to EDWARD WEBB, November 15, 1859. Application filed August 18, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

23,139.—Pumps.—Granted to WILLIAM WORRY, November 15, 1859. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

23,145.—Cocks for Water-Closets.—Granted to DARIUS WELLINGTON, November 15, 1859. Application filed August 11, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

23,147.—Machine for Bundling Kindling-Wood.—Granted to WILLIAM L. WILLIAMS, November 15, 1859; and reissued October 4, 1870. Application filed August 14, 1873. Testimony closes October 14, 1873. Hearing October 29, 1873.

23,177.—Rubber Belting.—Granted to DARIUS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

23,178.—Making Rubber Belting.—Granted to DARIUS C. GATELY, November 22, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

23,202.—Manufacture of Paper-Pulp.—Granted to JOHN B. PALMER and GARDINER HOWLAND, November 29, 1859; and reissued July 2, 1867. Application filed August 20, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

23,243.—Water-Closet Basins.—Granted to WILLIAM ROOM, Sr., November 29, 1859. Application filed June 18, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

23,244.—Machines for Registering Hands.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 20, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

23,263.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. PERRY, November 29, 1859. Application filed August 30, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

23,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

23,321.—Molding for Metal Casting.—Granted to JOHN P. BROADMEADOW, November 29, 1859. Application filed August 15, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

23,327.—Nursing-Bottles.—Granted to FRANCIS J. LA FORME, November 29, 1859, and reissued January 14, 1868. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

23,329.—Boot and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 22, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

23,339.—Water-Wheels.—Granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1860, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

23,401.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 22, 1869. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

23,403.—Composition for Kindling Fire.—Granted to ELIZABETH BELLINGER, December 13, 1859, and reissued August 7, 1866. Application filed September 15, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

23,419.—Seed-Planters.—Granted to WILLIAM BRADNER, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

23,454.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, Jr., December 13, 1859, and reissued April 3, 1860. Application filed September 13, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

23,475.—Breech-Loading Fire-Arms.—Granted to BETHEL BURTON, December 20, 1859, and reissued December 31, 1860. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

23,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 22, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,462.—Pipe-Molding.—Granted to John Ferth and John Ingham, December 30, 1859, and reissued April 26, 1863. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,467.—Screw-Taps.—Granted to William and Robert Fowne, December 30, 1859. Application filed September 18, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Trap.—Granted to James A. Lowe, December 30, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,512.—Nail-Plate Feeder.—Granted to John Newell, December 30, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to George Cook and Hannibal I. Kimball, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,580.—Harvesters.—Granted to John Gore, December 27, 1859, and reissued January 15, 1861. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to Jonathan P. Grosvenor, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to Samuel Lesso, December 27, 1859. Application filed September 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Porous Ware.—Granted to Bradford S. Pierce and Mason R. Pierce, December 27, 1859. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to Benjamin F. Stuntevant, December 27, 1859. Application filed September 25, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,674.—Clothes-Driers.—Granted to B. B. Hawes, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to Lester T. Hulbert, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to Francis C. Lowthrop, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,735.—Waste-Cocks of Hydrants.—Granted to George W. Robertson, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,805.—Manufacture of Boots and Shoes.—Granted to Francis D. Ballou, January 10, 1860, and reissued April 29, 1862. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,829.—Tool for Cutting Round Tenons.—Granted to Levi A. Dole, January 10, 1860. Application filed September 26, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,860.—Machines for the Manufacture of Tinware, granted to Samuel J. Oldroyd, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to George M. Cummings, January 24, 1860. Application filed September 29, 1873. Testimony closes December 22, 1873. Hearing January 7, 1874.

26,909.—Lamps, granted to George Nelson, January 24, 1860. Application filed October 16, 1873. Testimony closes December 22, 1873. Hearing January 7, 1874.

27,065.—Coffee-Mills.—Granted to John and Edmund Parker, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to John T. Lowt, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

30,467.—Apparatus for Singeing Pigs, granted to Abraham and Edward M. Denny, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,263.—Fare-Boxes.—Granted to John B. Slawson, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

25,796.—Improvement in Jacquard Machines, granted to Avery Babbett, October 16, 1859, (Helen M. Babbett, executrix.)

Claim.—1. Arranging two or more trap-boards in one frame in such manner that when all the said trap-boards, so arranged, are lifted for the purpose of opening the shed all the untrapped knot-cords may pass said trap-boards without obstruction, in combination with an ascending and descending suspension-board, substantially as above described.

2. In combination with the jacquard machine, the device represented on the sides of the machine for working the journals or parts of journals, consisting of the pin-wheel Z, shaft B, hooks *y y y y*, and the hooks *o o o o*, and the dog E, substantially in the manner and for the purposes specified.

3. Dividing the journals commonly used in two or three ply jacquard weaving, and working them in any required order, substantially in the manner and for the purpose above specified.

Disclaimer filed October 11, 1873.

Disclaims third clause of claim, as above set forth.

25,797.—Improvement in Harvesters, granted to Ephraim Ball, October 18, 1859. (Daniel Corbaugh, administrator.)

Claim.—1. The hinged plate G, constructed as shown and specified, in combination with the finger-bar D and brace-plate E, substantially as described.

2. The combination of the coupling-arm *i*, swiveled only at the point of connection with the main frame, in combination with the hinged plate G, hinged brace-plate E, and guide-piece F, substantially as set forth.

3. The guide-piece F, in combination with the brace-rod *f*, hinged plate G, brace-plate E, coupling-arm *i*, and chain *b''*, substantially as described.

4. The combination and relative arrangement of spur F with coupling-arm *i* and pitman *k*, as and for the purposes set forth.

5. The combination of the hinged plate G and adjusting-screw *s* with the slotted guide-piece F, hinged brace-plate E, and chain *b''*, arranged as and for the purposes set forth.

25,807.—Improvement in Hem-Folder, granted to Levrett Clark, October 18, 1859.

Claim.—The hem-folder composed of a straight gage, *a*, an adjustable plate, C, constructed as described, and a bar, A, the whole combined as described, either arranged as shown in figures 1, 3, and 4, or as in figures 2, 5, and 6, and operating substantially as herein described.

25,814.—Improvement in Sleeping-Cars, granted to John Danner, October 18, 1859.

Claim.—1. The combination of the hinged false back *d* with the permanent back *a*, as and for the purposes set forth.

2. Making each alternate back *a* with a false back, *d*, in combination with making each alternate back *a'* shorter than the backs *a*, and hinged to the seat *a'*, substantially as and for the purposes set forth.

25,843.—Improvement in Cultivators, granted to Thomas McQuiston, October 18, 1859; reissued May 16, 1871, numbered 4,383.

Claim.—1. The combination, in a walking straddle-row cultivator, of the following instrumentalities, viz.: Two wheels, E, tongue D, axle E, and two plow-beams, A A, each beam carrying a handle, and one or more shovels or plows, and independently connected or hinged by brackets C to the axle, so as to permit of their being raised or lowered independently or moved laterally by the handle, as set forth.

2. The combination, in a walking straddle-row cultivator, of the following instrumentalities, viz.: Two wheels, E, tongue D, axle E, two plow-beams, hinged as aforesaid, and rear connecting shackles or links F, all operating in combination, substantially as and for the purpose set forth.

3. The plates H, interposed between the shares G and standards *a'*, for the purpose set forth.

25,869.—Improvement in Weeding-Hoes, granted to James M. Adams, October 18, 1859.

Claim.—The arrangement of the two blades with the bifurcated handle, the whole being constructed in the manner and for the purposes herein set forth.

25,867.—Improved Machine for Covering Saddle-Trees, granted to John Maclure, October 18, 1859.

Claim.—The employment of an elastic bed or cushion, D, in combination with the cover and seat J, substantially as and for the purpose herein shown and described.

2. The arrangement and combination of the box B, adjustable sliding bars E, elastic cushion D, seat J, clamp K, and pressing-lever G, as and for the purposes herein shown and described.

DISCLAIMERS FILED.

25,796.—Helen M. Babbett, executrix of Avery Babbett, deceased.—**Improvement in Jacquard Machines,** dated October 16, 1859. Disclaims:

"The third claim in said specification."

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date October 14, 1873.]

6,956.—Door-Knobs.—Joseph O. Hollis, Boston, Mass. Application filed October 2, 1873. Term of patent 3½ years.

6,957.—Rubber Boots.—Lewis L. Hyatt, New Brunswick, N. J. Application filed May 10, 1873. Term of patent 14 years.

6,958.—Stove.—John Martino, Philadelphia, Pa., assignor to Charles Noble & Co., same place. Application filed August 16, 1873. Term of patent 3½ years.

6,959.—Picture-Frames, &c.—John Nonnenbacher, New York, N. Y. Application filed September 19, 1873. Term of patent 3½ years.

6,960.—Statue.—John Rogers, New York, N. Y. Application filed September 4, 1873. Term of patent 14 years.

6,961.—Kite.—Samuel M. Simonds, Philadelphia, Pa. Application filed September 15, 1873. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date October 14, 1873.]

1,488.—Boot and Shoe Blacking.—Louis Amson & Co., New York, N. Y. Application filed September 27, 1873.

A group of a boot, bird, boy, and monkey. The words 'Jacquot & Co., brush-blacking,' above; the words 'Paris. Louis Amson & Co., New York, sole agents for the U. S.,' below."

1,489.—Blacking or Grease for Shoes, &c.—Louis Amson & Co., New York, N. Y. Application filed September 27, 1873.

"A group of a girl, gaiter, table, and box of blacking. The words 'Louis Amson & Co., New York, sole agents for the U. S.,' below; and the words 'Vve Bernard's French Glycerine Blacking,' in a circle."

1,490.—Barrels of Whisky.—Derby & Day, St. Louis, Mo. Case A.—Application filed August 30, 1873.

"A green ground, containing the name of the firm, 'Derby and Day,' and the words 'Sunny South.'"

1,491.—Corset-Steel Springs.—Francis Lee Egbert, New York, N. Y. Application filed August 26, 1873.

"'Cantbreaken.'"

1,492.—Shirt.—Korn, Lebrerman & Co., Philadelphia, Pa. Application filed September 23, 1873.

"'The Universal Shirt.'"

1,493.—Brushes.—James M. C. Martin, New York, N. Y. Application filed September 23, 1873.

"A boar's head with a paint-brush in his mouth."

1,494.—Clothes-Wringers.—Queen City Wringer Company, Cincinnati, Ohio. Application filed August 7, 1873.

"'Peerless.'"

1,495.—Baking-Powder.—Royal Baking Powder Company, New York, N. Y. Application filed September 23, 1873.

"'Royal.'"

1,496.—Stoves.—James Strain & Co., Philadelphia, Pa. Application filed October 15, 1873.

"'Anti-Clinker.'"

1,497.—Grinding-Mills.—Isaac Straub & Co., Cincinnati, Ohio. Application filed August 7, 1873.

"'Queen of the South.'"

1,498.—India-Rubber Boots.—The L. Candee & Co., New Haven, Conn. Application filed September 5, 1873.

"'Equimaux.'"

1,499.—Quicksilver-Flasks.—The Quicksilver Mining Company, New Almaden, Cal. Application filed September 20, 1873.

"the letter A straddling a circle."

1,500.—Window and Mirror Polish.—Horace M. Wade, Philadelphia, Pa. Application filed September 29, 1873.

"two stars arranged one within the other."

1,501.—Medicine.—John L. Graham, Pittsburg, Pa. Application filed October 9, 1873.

"the words 'Children's Health Restorer.'"

1,502.—Lubricating-Oils.—Leonard & Ellis, New York and Brooklyn, N. Y. Application filed September 26, 1873.

"'Valvoline,' and a crescent or half-moon."

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date October 14, 1873.]

ORIGINAL PATENTS.

143,535.—Oxyhydrocarbon-Gas Burner.—John D. Averell, New York, assignor of part of his right to S. A. Joyce, Brooklyn, N. Y. Application filed December 18, 1872.

The tubes conducting the hydrocarbon-gas lead from a common chamber up to the exit of the oxygen, and are inclined toward each other at an angle of about eighty-five degrees.

Claim.—The combination, in an oxyhydrocarbon-gas burner, of the sphere A, hydrocarbon pipes and burners *a b*, and oxygen-burner B, said pipes and burners being so arranged with relation to each other as to produce a flat flame, as described.

143,536.—Tailor's Measure.—Joseph Beaudry, Montreal, Canada. Application filed April 1, 1873.

A flexible metallic strip, graduated on its edges, has a short fixed arm at a right angle near one end, to be placed snugly in front of a person's shoulder, while the strip is around the body; also, two adjustable graduated blades projecting in opposite directions, the longer down the back and having a transverse adjustable arm, with studs at each end for tapes, the shorter to bend over the shoulders. The main strip has tape-studs at the various points, from which it is desirable to take measurements.

Claim.—The tailor's scale, consisting of the flexible blade A, provided with the fixed arm *a*, graduations *b c*, and studs *s*, the flexible adjustable blades B C, graduated as shown, the transverse adjustable blade D, provided with the studs *t*, and the straps E, all constructed and arranged as shown.

143,537.—Door-Hanger.—Solomon L. Bignall, Chicago, Ill. Application filed June 23, 1873.

Claim.—The wrought strap A, provided with a groove, C, and bent over at its top to receive the hub G of the roller E, and to support the pivot D, as and for the purpose set forth.

143,538.—Machine for Bending Sheet-Metal.—Charles F. Brand, Philadelphia, Pa., assignor of one-half his right to Philadelphia Architectural Iron Company. Application filed March 11, 1873.

The stationary form-plate is beveled to form an acute angle when the lever-plate is brought down to a horizontal position. The clamping-bar is held down by eccentric levers.

Claim.—The combination of the beveled-edge lever-plate C and stationary bevel form-plate B with the bench A and clamping-bar F, for forming the angles *a b* of the sheets E, substantially as described.

143,539.—Churn-Dasher.—Israel B. Compton, Seward, Neb. Application filed January 4, 1873.

Claim.—The perforated tubular staff E open at its lower end, in combination with the horizontal tubes Y and upright tubes Z opening under the dash C, the whole designed to furnish passages for the air under the dash, substantially as and for the purpose specified.

143,540.—Car-Wheel.—Almond F. Cooper, Cambridge, Mass. Application filed April 7, 1873.

Improvement on patents Nos. 90,651 and 103,573, of 1870. The inner flanges of the divided hub are secured by means of a wrought-iron ring shrunk on the flanges.

Claim.—In combination with the web and hub-pieces of an elastic packed car-wheel, the wrought-iron ring, applied substantially as described, for the purpose specified.

143,561.—Boot and Shoe Channeling Machine.—Charles S. Dunbrack, Swampscott, Mass. Application filed July 21, 1873.

Claim.—In a machine for channeling and feather-edging, the combination of the knife a a^1 a^2 a^3, and the adjustable block b with the bed-plate c, all constructed substantially as set forth, and for the purposes specified.

143,562.—Wash-Bench.—Alson G. Emery, South Boston, Mass. Application filed August 6, 1873.

On the under side of the board are notches with inclined planes and recesses, into which the ends of the struts that are attached to the folding cross-legs rest when the bench is in use.

Claim.—In a folding wash-bench the locking-notches E E, provided with the inclined planes b b and recesses c c, and arranged in the top board A, and with the two sets of folding legs and struts applied together and to the said top board, all being essentially as set forth.

143,563.—Compound for Making Artificial Stone.—William E. Fenelew, New Orleans, La. Application filed June 23, 1873.

The block of stone, composed of the heavy and light cements, when taken from the mold is first exposed for twelve hours, then placed in a bath of silicate of soda for twenty-four hours, dried twelve hours, placed in a bath composed of a solution of carbonate of lime in muriatic acid for six hours, and finally exposed to the sun and air for two days, when it is ready for use.

Claim.—In the manufacture of artificial stone, heavy Portland cement for the outside and light American cement for the inside, compounded and treated in the manner described.

143,564.—Waffle-Baker.—Samuel S. Fitch, New York, N. Y. Application filed May 7, 1873.

The waffle or pancake is subjected to heat applied to its opposite sides simultaneously.

Claim.—As a new manufacture, pancake or waffle baker, having its jaws chambered, substantially as described, and for the reception of heaters, as explained.

143,565.—Cutter-Head.—Herman Fletcher, Louisville, Ky. Application filed February 23, 1872.

The cutting-blades are pivoted in the binding-collars. The cutting-edges, working in either direction, press outwardly, and the curved surfaces become eccentric, thus giving a clearance.

Claim.—1. The combination of the spindle A and collars c A with the pivoted cutters B, all constructed and arranged to operate substantially as described.

2. The spindle A, provided with the grooves d, in combination with the rings e A provided with tongues e, and the pivoted cutters B, substantially as set forth.

143,566.—Revolving Fire-Arm.—Sullivan Forehand and Henry C. Wadsworth, Worcester, Mass. Application filed April 5, 1873.

Claim.—1. The combination, with the cartridge-cylinder in a revolving fire-arm, of a stop or friction device actuated by the lock mechanism for retaining the cylinder in proper position when the piece is at half-cock, or when the cylinder is released by the cylinder-bolt, and before the advancing hand engages the cylinder-ratchet, substantially as set forth.

2. The combination, with the cylinder B, cylinder-bolt E, and its spring a, of the friction pin or stud I, substantially as and for the purpose set forth.

143,567.—Oil-Can.—William A. Foster, Fitchburg, Mass. Application filed August 21, 1873.

A measuring-chamber arranged in the bottom of the can is connected with the discharge-pipe. The can being turned from a vertical to a horizontal position, the discharge of oil is limited to the capacity of the measuring-chamber.

Claim.—1. The improvement in oil-cans consisting in the chamber d and tube e e', applied to the can, substantially as and for the purpose described.

2. In combination with the chamber d and its tube e e', the vent-tube g, having its lower end arranged, relatively to the chamber d, substantially as shown and described.

143,568.—Stay for Ships' Sails.—Charles Freeman, Brewster, Mass. Application filed August 27, 1873.

The sail is provided perpendicularly through its middle with a stay-rope, which is made fast to the mast-head, passes through eyes or grommets on the sail, and is attached by an eye to a traveler on the deck. By this means the sail has a support through its middle, and, when shifted, is prevented in a measure, by the stay, from whipping. A slit in the upper part of sail, provided with double-eyed hanks, allows the sail to be furled without disengaging the stay-rope.

Claim.—1. The combination of the stay b and the system of hanks or running-eyes a, arranged as described, with the square sail of a navigable vessel.

2. The combination of the stay b, the system of hanks or running-eyes a, the hook or traveler c, and the rail c, together and with the square sail of a vessel, all being arranged substantially in manner and for the purpose specified.

3. The sail as provided with the slit e and two or more double-hooked hanks, K, as described.

143,569.—Brick-Machine.—David W. Glendinning, Detroit, Mich. Application filed January 31, 1873.

Having a revolving drum rotated by a traction-wheel, and a press-drum adjustably pivoted thereto, the mud being fed into the hopper above, the mold-drum and press having a strike arranged to smooth the brick in one and scrape the adhering clay from the other, the mold-drum being provided with a tripping device for dropping the bricks as the machine moves over the ground. The rear part of the hopper is partitioned off to form a mud-box, regulated by a valve. Behind is a water-tank with pipe, regulating-cock, and perforated cylinder to wet the molds that the sand will adhere to them.

Claim.—1. In a machine of substantially the described construction, the mold-drum having the sectional molds N, bottom O, followers c, guides A, springs B, hooks m, latch n, ring o, bell-crank latches p, levers P, and bell-cranks R, combined and arranged as described.

2. The combination of the cam J, operated as described, with the peculiarly-formed spring h and the latch p, as described.

3. The combination of the water-tank, pipe, and sprinkler with the mold-drum, as described.

4. The combination of the water-tank, having its pipe and sprinkler, and the sand-box, having its valve, with the mold-drum, the parts being arranged as described, for the purpose set forth.

5. The combination of the strike X with the mold-drum and press-drum, the same being so arranged as to smooth the brick in one and scrape the adhering earth from the other, as described.

6. The combination of a mold-drum with a press-drum, the latter being made adjustable, substantially as and for the purpose described.

143,570.—Dumping-Wagon.—Robert Green and William J. Thomason, Raleigh, N. C. Application filed August 21, 1873.

Claim.—The thills D, connected to the sills B of the box A above and in front of the axle, in combination with the cross-bar E, spring-catch b, and releasing-lever F, all constructed to operate substantially as shown and described.

143,571.—Barrel-Head.—Alexander Harvey, Steubenville, Ohio. Application filed August 25, 1873.

Head is formed in three sections, the middle one V-shaped; the wide end held in the cross, and sharp end by a metallic plate.

Claim.—A barrel-head constructed with overlapping joints, and in which the parts are held in place by a metallic plate, in the manner substantially as hereinbefore set forth.

143,572.—Horse Hay-Rake.—William H. Hartley, Philadelphia, Pa. Application filed July 16, 1873.

Arms are so connected to a pivoted clearer-head and the toggle-levers, which look the supporting-wheel and pivoted rake-head, that the clearer-teeth first receive a downward motion to dump the accumulated hay and then rise with the rake-teeth.

Claim.—1. The lever M, lever N, and link Q, in combination with the rake-head C, levers F, and ribs H, substantially as and for the purpose set forth.

2. The two arms V jointed to each other, and one attached to the clearer-head S, and the other jointed to the lower inner angle a of the rake-head C, and operating as set forth, and for the purpose described.

3. The ribs H, sliding levers F, toggles J, hand-rod K, and foot-lever M, combined and operating substantially as set forth.

143,573.—Bung.—Hiram K. Hazlett, St. Louis, Mo. Application filed July 3, 1873.

The bushing has screw-threads inside and outside, and with a ledge upon the interior having a shoulder for the packing. A suitable key is inserted in the opening formed by the ledge for screwing the bushing in the barrel. The bung is sealed by the pouring of lead or wax into a dovetail recess, entering partly into the bushing and partly into the bung, and afterward suitably stamped.

Claim.—1. The bung B, consisting of the bushing C, provided with the threads inside and outside, as shown, and with the ledge D having the shoulders d d', &c., for the purpose described, the stopper E, constructed as set forth, and the washer J, all constructed, combined, arranged, and operating substantially as specified.

2. In the bung B, the recess K, as and for the purpose described and shown.

143,574.—Dead-Light for Steam-Boilers.—John C. Hoadley, Lawrence, Mass. Application filed July 19, 1873.

The outer disk and insulating chamber protect the inner disk from sudden changes of external temperature, while the inner disk protects the outer one from the hot water in the boiler.

Claim.—The boiler dead-light provided with the two glass disks A B and the insulating-space D, and the elastic packing C between them all, substantially as explained and represented.

143,575.—Shutter-Fastener.—Abram A. Hoagland and William Meeker, Oneonta, N. Y. Application filed July 15, 1873.

A hinged horizontal cylinder has a hopper above and an interior rotary shaft passing through its center, carrying mixing and feeding blades. A sliding gate below the lower mouth, when open, permits the mortar or clay to pass between two rolls beneath for a more thorough crushing, these having cleaning-scrapers.

Claim.—1. The combination, in the cylinder, of the part B, provided with hopper F, and the part C, having the sliding gate G, the parts being connected by hinge D, to form the cylinder, substantially as and for the purposes set forth.

2. In a mixing-machine, the ribs I and J, provided with the teeth or blades H or K, for attachment, respectively, to the cylinder and shaft, as and for the purposes set forth.

143,576.—Carriage-Spring.—George Hopson, Bridgeport, Conn. Application filed February 5, 1872.

Claim.—1. The spring-plates A A, having bearings C C, in combination with bolt F, when all are constructed as described.

2. The cup-bearings, formed by the projections B B forged to spring-plates A A, in combination with bolt F having head E, as described, and the cup-shaped nut E', substantially as set forth.

143,577.—Photographic Printing-Frame.—William H. Jacoby, Minneapolis, Minn. Application filed March 7, 1873.

By the particular construction and arrangement of the parts indicated in the claim positive pictures may be printed from negative plates, either upon porcelain or other surfaces, by contact in the usual manner, by the same frame without the addition, substitution, or removal of any of its parts.

Claim.—1. The combination of the movable or adjustable bed a, levers c, rods c^1, handles c^2, springs f, and clamping-rods g g, in the manner and for the purpose substantially as described.

2. The combination of the parts named in the preceding claim with the springs i i, substantially as and for the purpose described.

3. The combination of the parts named in the two preceding claims with the rests e, clamp A, when constructed and operated substantially as and for the purpose described.

143,578.—Rake.—John O. Jones, Boston, Mass. Application filed April 24, 1873.

An implement adapted to different grades of work.

Claim.—A hand rake-head formed of metal in one casting or piece, consisting of the two rows of teeth A B, the one fine, the other coarse, the central bar C, and the shank D, the same being constructed and adapted to be applied to a suitable handle, as herein shown and set forth.

143,579.—Cracker-Machine.—Gilbert J. Kingsbury, Rochester, N. Y. Application filed April 3, 1873.

Above the carrying-belt is suspended the picker or lifting roller in heads or hangers attached to the frame of the machine. Each end of said roller is provided with one or more enlargements, which have several points that are caused to impinge sufficiently upon the belt to secure the partial rotation of the roller at every movement of the belt. To the rear of the machine is attached a gathering-board on a horizontal line with a pivot in the roller about midway between the axis and top. To said board are attached rods. The free ends of said rods rest in grooves between the enlargement on the rollers, and serve to clear or lift up the dough-scraps. To said rear board is also attached a cutter to centrally divide the sheet of dough-scraps.

Claim.—1. In combination with the picker-roller B, a scrap cutter or divider, g, for the purposes set forth.

2. In combination with the pins i and roller B, the clearers b, constructed and arranged to operate in the manner and for the purposes set forth.

3. The picker teeth or pins i and roller B in cracker-machines, in combination with the dough-belt D, for the purposes set forth.

4. The combination, in cracker-machines, of the dough-belt D and primary roller B, with its picker-pins i, with the scrap or gathering board C, and clearers b, all acting conjointly as and for the purposes set forth.

143,580.—Baking-Powder for Bread.—John G. Kopping and John Weideman, Clinton, Iowa, assignors of one-half their right to Archibald B. Henry, same place. Application filed September 2, 1873.

Barley-malt flour, tartaric acid, cream tartar, soda, wheat flour, corn-starch.

Claim.—The baking compound, of the ingredients in the proportions stated, prepared in a dry state, to be mixed with the flour, all substantially as described.

143,581.—Fire and Water Proof Roof.—Joseph Long, Mechanicsburg, Pa. Application filed August 27, 1873.

Claim.—A fire and water proof roof composed of the boards A A A with the rabbets or grooves B B B sunk in the one side thereof, forming thereby the elevated edges or margins E E, which are closely joined and the joints covered with wooden caps D or zinc caps C, the boards thus joined being fastened to the laths F F of the building, and the whole roof thus prepared covered with a cement composed of equal portions of common paint and gum-shellac sanded and applied as shown at B' G, the whole combined, constructed, and used in the manner and for the purposes herein set forth.

143,582.—Shaft-Holding Attachment for Carriages.—Allen C. Maxfield, Biddeford, Me. Application filed August 19, 1873.

Designed to hold carriage-shafts in an elevated position when not in use.

Claim.—The combination of the hook a and spring b, applied to a carriage, as herein set forth, and for the purposes described.

143,583.—Fumigator for Hospital and other Uses.—Thomas J. Mayall, Boston, Mass. Application filed September 1, 1873.

Claim.—A portable fumigator for hospital and other uses, consisting of a shell or case, containing an under heating-chamber provided with a lamp, an upper chamber or receptacle to contain water, and an acid cup or vessel suspended within said chamber, the acid-cup and upper chamber being closed by a perforated cover common to both, as shown and set forth.

143,584.—Caliper.—William H. Miner, Boston, Mass. Application filed August 13, 1873.

One leg of the caliper has a curved slotted arm. Through the slot passes a pin, upon one end of which is a screw, upon which is a milled nut for clamping this arm to a collar near the middle of the pin. On the other half of the pin is a milled sleeve, the inner end of which is eccentric, and fits through a round hole in one end of a link, the other end of which is pivoted to the other leg of the caliper. The slot, screw, and nut are for approximate, the eccentric and link for minute, adjustment.

Claim.—In the calipers as described, the flat arm B, the rotary eccentric c, and head d, the arbor e, the shoulder f, the screw g, and nut A, arranged and combined together as set forth, and applied to one of the caliper-legs A A', and also to the slotted limb B of the other, all substantially in manner and to operate as specified, whether the calipers be provided with or be without the clamp-screw C and nut D, arranged with them as explained.

143,585.—Shutter-Fastening.—James A. Morris, Atlanta, Ga. Application filed September 5, 1873.

An annular rack of cast metal, having a series of cog-teeth or stops upon its upper surface, is rigidly attached to the shutter, near the bottom, so arranged as to have a rotary motion traversing through an opening in the shutter or door to which it is secured. There is also a drop-catch in a case attached to the inside of the shutter, the catch having a lifting pin or stud and a serrated or toothed face, engaging automatically with the teeth or cogs of the annular rack.

Claim.—The annular rack C, rigidly secured to the blind, in combination with the drop-catch F, held in the case E, as described.

143,586.—Hay and Cotton Press.—Joseph Müller, Nacogdoches, Tex. Application filed July 5, 1873.

The press is placed upon a bed-plate, which is connected with a weighing device, so that the weight of each bale may be uniform.

Claim.—The press A, so resting on a pivoted platform, A, as to operate in connection with an ordinary scale, substantially as described.

143,587.—Stone Pavement.—Thomas D. Owens, Pittsburg, Pa. Application filed September 9, 1873.

Claim.—The within-described pavement, composed of a bottom layer of broken stone, an intermediate layer of fine sand, and a top layer of stone-work, the interstices of which are filled with a suitable cement or bond.

143,588.—Separator for Thrashing-Machines.—Squire R. Perkins, Greenville, Mich., assignor to himself and Thomas J. Harrison, same place. Application filed April 21, 1873.

Grain is delivered from shoe, and then discharged by worm-conveyer into vertical leg of pipe L, whence it falls into a receptacle, while chaff is drawn by a fan through the tube, and discharged at spout M. Diaphragm S prevents chaff from being carried into fan-case.

Claim.—1. The combination of the fan R, the pipe L, provided with the spouts M and N, and hollow tube O, all constructed, arranged, and operating substantially as described and shown, for the purposes set forth.

2. The combination of the cams H, the rear supports J, and the shoe G, constructed, arranged, and operated substantially as described and shown.

143,589.—Corder for Sewing-Machines.—John G. Powell, Philadelphia, Pa. Application filed August 11, 1873.

The guides are formed from the metal of the spring, one open and curved to facilitate the entrance of the cord, and the corrugated part gives the spring strength.

Claim.—The corder herein described, consisting of the spring B attached to the presser, corrugated at B', and provided with the open guides C and C' having guiding-ears, as shown, all being constructed and operating as set forth.

143,590.—Candy-Cutter.—Francis Quinn, Keokuk, Iowa. Application filed August 13, 1873.

The reciprocating frame, carrying the knives, works at each end in gates, which slide up and down in grooves in an upright frame. A horizontal arm extends from the lower sides of each gate, on a line with, and just beneath, the knives. To the end of each arm is fixed a box containing sponges, saturated with oil, and scrapers, through which the reciprocating knives pass, and are thus cleaned and lubricated.

Claim.—1. The candy-cutter having cutters C C set in one reciprocating frame, D, and having feed-board G, with its cover H fitted to it, to slide in grooves, all substantially as set forth.

2. The candy-cutter having knives with both sides beveled to make the front and back thin and the center thicker.

3. The candy-cutter with each knife passing through oil-boxes or oilers to lubricate it.

143,581.—Refrigerator.—JEREMIAH ROHRER, Lancaster, Pa. Application filed August 21, 1873.

The cross-bars for supporting the ice are hollow, forming a continuous tube, connecting at one end with the water-tank placed at one side of the ice-chamber, and at the other end with a second coil or tube passing beneath the draining-slats, so that the water to be cooled is subjected to the refrigerating effect of both the ice and drip water.

Claim.—The arrangement of the tubular ice-rack H E G, in combination with the draining-slats L L′ L″, trough M, pipe N, and tank K, all constructed substantially in the manner and for the purpose set forth.

143,582.—Car-Axle Box.—LOUIS SCHULER, Chicago, Ill. Application filed August 2, 1873.

A pendulum-lever is turned down against the front of the axle-case, a rubber tent projecting through its inner face, covering the exterior opening of the oil-duct.

Claim.—The pendulum-lever E, pivoted to the box A, and provided with the inwardly-projecting washer *d*, with relation to the oil-duct *e* of the drawer D, as and for the purpose set forth.

143,583.—Car-Coupling.—JAMES SHISLOVE, Tiffin, Ohio, assignor of one-half his right to JOHN NELIGH. Application filed March 14, 1873.

When the pin is adjusted for automatic coupling its longest leg rests on a plate pivoted to the bottom of the draw-head. The plate has a stud projecting up from it, by which it is turned from beneath the pin when the link enters. The plate is held in position either by a spring or weighted lever.

Claim.—1. The pin B, bent of plain round iron, used in connection with, and supported by, the plate C, in the manner described, and for the purpose set forth.

2. The plate C and the crank-shaped lever *a*, constructed to operate substantially as described, and for the purpose set forth.

3. The combination of the draw-bar A, the pin B, the plate C, the lever *a*, the loop *c*, and the lever E, all constructed to operate substantially as described, and for the purpose set forth.

143,584.—Shoemaker's Pincher.—THOMAS B. SHELLY, Chicago, Ill. Application filed March 7, 1873.

The upper jaw is constructed in two parts or halves, one half being cast with the lower lever. The other is segmental and detachable, each section of the jaw having a pendent projection, which serves as a fulcrum when used in crimping or stretching leather.

Claim.—The construction and arrangement of the levers A B, jaws A′ B′ B″, and pendent fulcrums *b* connected by the key *c*, substantially as and for the purpose set forth.

143,585.—Combined Square, Protractor, Rule, Bevel, Plumb, and Level.—CHRISTIAN J. SHOFF, Osceola, Pa. Application filed September 12, 1873.

An ordinary spirit-level stock, with plumb-vials at each end, has a protractor inscribed upon one side, and two swinging arms, one slotted, which are adjustable and held by a clamp-screw passing through the stock at the center of the protractor-arc.

Claim.—The rectangular frame *a*, provided with the spirit-levels *c*, *d*, and *e*, pivoted rule *g*, and slotted movable rule *i*, and a clamping device, *h*, for holding the rules in position, substantially as shown and described.

143,586.—Thill-Coupling.—JOHN C. THOMPSON, New Haven, Conn. Application filed August 7, 1873.

Claim.—In a thill-coupling, the rubber cushion or spring made with the perforation *b*, substantially as and for the purpose specified.

143,587.—Hydrostatic and Electric Telegraph Cable.—FERDINANDO TOMMASI, Paris, France. Application filed November 20, 1872.

One or more pairs of fine copper tubes enveloped with insulating material, and provided with pistons at each extremity for transmitting hydrostatic pressure through the tubes alternately, are in connection with reciprocating armature-levers of double electro-magnets at each end of the double line, in such manner that the hydrostatic impulses are given by the transmitting-magnets, while the reciprocating pistons at the receiving station make and break local electric circuits. The cables may be used for electrical transmission, if desired.

Claim.—1. The combination of a system of double hydrostatic signaling-tubes with the reciprocating armature of double electro-magnets at each end of the line, substantially as and for the purpose hereinbefore set forth.

2. The combination of the same with the ordinary receiving apparatus of the electric telegraph, substantially as hereinbefore set forth.

3. The application of metallic or electrically-conducting tubes to a system of hydrostatic signaling-lines, so as to enable such cables to be employed either as mechanical or electrical telegraph-lines, as desired.

143,588.—Saw-Set.—MOSES E. TRUE, Oakfield, N. Y. Application filed September 5, 1873.

The two rests R and S are fixed, while the anvil or punch D is adjustable, to set different sized teeth.

Claim.—The anvil D, arranged adjustably upon the pivoted lever C, in combination with the fixed points or rests R and S upon the stock A, as shown and described, for the purposes set forth.

143,589.—Dice-Box.—JOHN TWAMLY, Troy, N. Y., assignor of two-thirds his right to PETER J. STRAIN, same place. Application filed April 11, 1873.

The globular chamber gives room for mixing the differently-colored balls. Only three at a time are visible through the glass tube, which should, after shaking, be held upright, as shown. The value of the throw is found by comparison with the marked color-scale upon the outside of the box.

Claim.—1. The globular or other formed chamber A, provided on its outer surface with differently-colored numbers, in combination with the transparent tube B and handle C, substantially as described.

2. In combination with the subject matter of the above clanes of claim, the balls *a a*, arranged to correspond in color with the figures on said chamber, substantially as set forth.

143,590.—Manufacture of Iron from Blast-Furnace Slag.—JOHN J. VINTON, Sharon, Pa. Application filed October 3, 1873.

Coke, oxide of iron, slag, and limestone, thrown into the cupola in succession and from time to time, as required.

Claim.—The herein-described method of reducing iron from the slag or refuse of blast or smelting furnaces, substantially as set forth.

143,591.—Surface-Coating to Hard Soap.—WILLIAM V. WALLACE, Boston, Mass. Application filed June 27, 1873.

Resin-soap, beef-tallow, wax or spermaceti; melt in a vessel, and add water. The soap is then dipped in the mixture and placed upon racks to dry.

Claim.—The application of a surface-coating to hard soap, when the soap is mixed or filled with soda or its equivalent, for the purpose herein described.

143,592.—Pneumatic Action for Organs.—THOMAS WINANS, Baltimore, Md. Application filed July 22, 1873.

The action, whether for the manual keys or stop or register draws, is balanced by equal wind-pressures upon both sides of the valve as well while at rest as when in action.

Claim.—1. A pneumatic action for organs, comprising the combination, with the pneumatic valves directly regulating the admission of air to the register-chests or the pipes of valves and inclosing valve-chambers, communicating on the one side with the source of compressed-air supply, and on the other side with ducts leading to said pneumatic valves, said parts being constructed and arranged to operate substantially as herein shown and described, so that whether the valves be opened to throw the said ducts in communication with the source of said compressed-air supply, or closed to shut off such communication and allow the air in the ducts to exhaust therefrom, the compressed air contained in the valve-chambers will at all times exert equal pressure on all parts of the valves so as to balance them.

2. The slide-valves, provided each with top, bottom, and intermediate ribs, as described, in combination with their valve-chambers, provided each with a corresponding number of ribs, the same being formed and arranged with relation to one another, substantially as shown and described, for the purposes set forth.

3. In combination with the said ribbed slide-valves and correspondingly-ribbed valve-chambers, arranged relatively to each other, as described, the manual-valve box containing a wind-chest opening into one of the valve-spaces formed in each valve chamber, and air-ducts or passages leading out of the other valve-space in said chamber to the pneumatic valves, said parts being arranged for joint operation in the manner herein set forth.

4. The ribbed slide-valves and their stationary ribbed partitions or plates, arranged on and carried by a breast-plate on the valve-box, provided with a longitudinal partition corresponding to the central ribs of the stationary plates, and formed below and above said longitudinal partition with apertures leading respectively from the lower valve-space of each valve to the wind chest of the valve-box and from the upper valve-space to the pneumatic air duct or passage, substantially as and for the purposes shown and set forth.

5. The combination, with the balanced slide-valves, the chambers for said valves, and the manual-valve box arranged together, substantially as described, of the pneumatic valves, one for each organ-pipe, arranged in the register wind-chests to play up and down in valve-chambers, communicating with their respective slide-valves by ducts or passages which, by means of said slide-valves, may be thrown into communication either with the source of compressed-air supply or with the external atmosphere, substantially as and for the purposes shown and set forth.

6. The pneumatic valve herein described, consisting of a stem provided with a head playing between guides and carrying an oscillating valve proper, and a base fitting and arranged to move up and down in a bearing-sleeve within a socket or air-chamber, and upheld by a spring, or otherwise, as specified, the said valve being arranged within the register wind-chest or the main wind-chest, as the case may be, and operated by the difference between the air-pressures in the said chamber and the wind-chest in which said valve is located, substantially as set forth.

143,593.—Apparatus for Cleansing Dyed Wool, &c.—JAMES E. ACKROYD, Chester, Pa. Application filed August 4, 1873.

The studs on the curved side of the tank are inclined so that the wool will rise over them when carried up by the blades attached to the truck, the blades being themselves curved so as to pass over the wool on the downward movement of the truck.

Claim.—The combination of a rolling or sliding truck or trucks, D, and blades F, with a tank having a curved side, B, with studs or blocks C or equivalent wire-netting on its inner surface, substantially as specified.

143,594.—Belt-Clamp.—ELEAZER AINSWORTH, Wilmington, Del. Application filed July 26, 1873.

Claim.—1. The combination, with clamps B having stop-pins *b*, of the right and left hand threaded rods D and nuts *d*, as shown and described, to operate as specified.

2. The clamp B, consisting of base piece B¹, with end recesses *a* and lugs *b*, top piece B² having slotted hole for opening and closing, and thumb-screws C for attaching them to belt A, constructed substantially as set forth.

143,595.—Portable Fire-Extinguisher.—ISAAC C. ANDREWS, New York, N. Y. Application filed July 5, 1873.

A ratchet-lever and rack-bar forces down a bow which, having projecting pins, strikes against the upper edge of the acid-vessel and, pushing it off the stationary stopper, allows it to tip, and as it approaches a horizontal position the V-shaped notches admit of its escape from the bow, and, dropping bottom upward, hangs suspended.

Claim.—1. The combination, with an acid-vessel resting on pivots *c*¹ *c*¹, and a stopper-cover, A F, holding it upright, of rack, pinion, and sleeve I J K, as described, so that the acid-vessel may be locked in an erect position.

2. The V notches or sockets formed in the opposite sides of the acid-vessel B for suspending it detachably, substantially as herein shown and described.

3. The stopper E for the acid-vessel B, attached permanently to the cover A, substantially as herein shown and described.

4. The toes *c*², formed upon the arms of the bow C, for detaching the acid-vessel B from the stationary stopper F by the downward movement of the said bow C, substantially as herein shown and described.

5. The combination of the rack-bar I, ratchet-lever J, and yoke E with the cover A and bow C, for operating said bow, substantially as herein shown and described.

143,596.—Bottle-Corking Machine.—JAMES ARMSTRONG, San Francisco, Cal. Application filed August 21, 1873.

The standard upon which the bottle is placed and the operating-rod of the corker are so united to one treadle as to move toward each other simultaneously. A cork-receiver, working loosely in guides, adapts itself to different-sized bottles.

Claim.—1. The self-adjusting cork receiver and guide, consisting of the hollow cylinder, flanged at *i i*, and working loosely in the guide K, so as to adapt itself to different-sized bottles, as set forth.

2. The oscillating lever G, having the connecting-rods F and O, uniting its opposite ends with the plate C and the plunger L, respectively, for the purpose of giving these parts a simultaneous movement toward each other, substantially as and for the purpose herein described.

143,597.—Refrigerator.—WILLIAM M. BAKER, Fortville, Ind. Application filed June 28, 1873.

Water from the ice-receptacle flows over an air-chamber, divided by partitions having openings at alternate ends to cause the air to take a circuitous route, and passes into water-chambers provided with deflectors on both sides. The object is to throw cold water against both sides of the water-chamber, thereby cooling both provision-chambers. The water-chambers are provided with faucets, and an air-chamber is in the rear of provision-chambers.

Claim.—1. The cold-water chamber D, having aperture *a* for the ice-water, and tubular passages *g* for ventilating provision-chamber B, as set forth.

2. The cold-air chamber G, having partitions *d* to produce perfect cooling of air, as described.

3. The combination of frame A, central provision-chamber B, cold-water chambers D, ice-chambers E, cold-air chambers G, air-spaces H, and side provision-chambers B′, arranged and connected substantially as and for the purpose described.

143,598.—Photographic Cameo-Embossing Press.—ERASTUS B. BARKER, Brooklyn, assignor to E. and H. T. ANTHONY & Co., New York, N. Y. Application filed October 16, 1872.

The press is provided with an elastic bed and a die operated by a forked cam-lever, said die having a central opening so that picture can be inspected while under pressure. Springs beneath the die serve to raise the same with uniformity after the pressure has been withdrawn.

Claim.—The springs A, acting between the bed *a* and die *g*, in combination with the removable elastic block *b*, changeable die *g*, and actuating lever *e*, and cams *f*, substantially as and for the purposes set forth.

143,599.—Harvesting-Machine.—EDWIN BAYLISS, JAMES O. BROWN, and FRANÇOIS T. LOMONT, Massillon, Ohio, assignors to themselves and PLINY F. HODGES, same place. Application filed January 17, 1873.

The cut grain falls upon an endless-apron platform, by which it is carried to the elevating aprons, and by them delivered upon the receiver in convenient reach of the binder.

Claim.—1. The hinged binders' platform E, provided with the hinged wing-board or guard E′, substantially as set forth.

2. The combination of the hinged binders' platform E with the binders' table D D×, the part D× being hinged, as shown, so that it can be let down into a vertical position and secure the platform in position when the parts are folded for transportation.

3. In combination with the elevating-aprons C C¹, the pivoted chute-board *c*×, arranged over the upper roller of the outer apron C¹, and adapted to be set at any required angle for deflecting the grain, substantially as set forth.

143,610.—Policeman's Baton.—SIMON BERRY, Urbana, Ohio, and JOHN W. MCDONALD, Houston, Tex. Application filed April 12, 1873.

Claim.—As a new article of manufacture, a policeman's club formed wholly of rubber or similar flexible material, the head and handle being solid and the stem with or without a metallic core, B, substantially as described.

143,611.—Sewing-Machine Table.—WILLIAM H. BOYER, Baltimore, Md. Application filed August 25, 1873.

The pegs are attached by flanges to the cover. Said pegs are hollow, and conical in the interior opening. A conical piece of rubber is inserted at the largest end, and forced through sufficiently far to reach beyond the lower end of the peg, so as to form a buffer.

Claim.—1. The combination of a machine-cover of a sewing-machine table with pegs having buffers, substantially as and for the purpose described.

2. The conically-shaped hollow pegs of a sewing-machine cover having flanges and rubber or other buffers, substantially as described.

143,612.—Churn.—JOSEPH L. BRITT and TROY R. BRITT, Raleigh, N. C. Application filed August 4, 1873.

Two uprights secured to the lid support the operating mechanism and extend into the churn, forming a bearing for a crank-shaft carrying two rotary dashers, which shaft is connected with and operated by a vertically-reciprocating dash-rod, the lower end of which extends below the rotary dashers, and is provided with a dasher.

Claim.—The rotating dashers, reciprocating dashers, and the operating-gear arranged in the frame C D, and said frame attached to the removable churn-top, substantially as specified.

143,613.—Apparatus for Filling Cans with Tomatoes, &c.—CHARLES S. BUCKLIN, Red Bank, N. J. Application filed September 27, 1873.

The can is supported in a holder whose downward movement is arrested by a stop at such a point as to bring the opening of the can in line with the filling-cylinder, when the piston is forced down by means of the treadle filling the can, after which the cut-off is forced down. Any surplus escaping is received in the inclined trough under the cylinder.

Claim.—1. The adjustable can-holder formed of the adjustable bar or plate E, the hinged frame H, the sliding cut-off plate I, the stop J, and the spring K, in combination with the tube C, substantially as herein shown and described.

2. The arrangement of the tube C, piston M N, guide O, cross-bar P, cords Q, treadle S, cord T, and weight V, in connection with the frame A and troughs B D, substantially as herein shown and described.

143,614.—Breech-Loading and Magazine Gun.—BETHEL BURTON and WINGFIELD G. BURTON, Brooklyn, N. Y.; said BETHEL BURTON assignor to said WINGFIELD G. BURTON. Application filed April 11, 1873.

A magazine-gun having means provided for throwing the crank-lever which operates the carrier into and out of gear with the bolt mechanism, by which the gun may also be adapted to be used as a single breech-loader, and thus reserving the charges in the magazine until required for more rapid firing.

Claim.—1. The bolt-sections D D², when constructed substantially as described, and adapted to be combined and locked together by a stop, T or T′, to keep them from turning when open and unlocked, in the act of closing the breech, as and for the purpose hereinbefore set forth.

2. The combination of the crank-lever G H, link Q, and carrier O, substantially as and for the purpose hereinbefore set forth.

3. The means, substantially as herein described, for changing the pivot or fulcrum of the crank-lever G H, consisting of an eccentric pin or screw, in combination with said lever, so that the arm H may be thrown into or out of gear with the breech-bolt, substantially as and for the purpose hereinbefore set forth.

4. A shifting fulcrum-lever, in combination with a breech-block and a cartridge-carrier, substantially as and for the purpose herein before set forth.

5. The spring-gate O′, pivoted or hung in such relation with the flange or lip on the carrier that its flange or lip, when pressed inward, will shut past the lip on the carrier, substantially as and for the purpose hereinbefore set forth.

6. The receiver having an opening, substantially as described, to prevent the cartridge from being thrown out in its passage from the magazine, substantially as and for the purpose hereinbefore set forth.

7. The piston P, provided with the rib *b* and lump *a*, in combination with the incline *b*¹ and lever-extractor, substantially as and for the purpose hereinbefore set forth.

8. The V-spring *s*, when combined with the trigger and crank-lever and operating as a trigger and friction-spring, substantially as and for the purpose hereinbefore set forth.

9. The combination of the combined nose-cap and band and the ramrod, substantially as and for the purpose hereinbefore set forth.

143,615.—Uterine Supporter.—Almeda Clark Byam, Hopkinton, Iowa. Application filed January 27, 1873.

A supplemental piece is attached to the cup of the pessary at one end, and to the lower part of the stem at the other, so as to afford additional support to the parts, and also to keep the pessary more securely in position.

Claim.—The supplemental piece E, attached to the cup of the pessary at one end, and to the stem at the other, all as and for the purpose described.

143,616.—Copy-Holder.—Walter R. Carter, Brooklyn, N. Y. Application filed August 9, 1873.

A sheet of manuscript is inserted between two horizontal bars, the ends of which are fitted in slots of vertical posts secured to a base. The sheets are kept in position by adjustable guides surrounding the bars.

Claim.—The guides D D, combined with two horizontal bars, A A, held in mortises of two posts, C C, as and for the purpose described.

143,617.—Peat-Machine.—Henry Clayton, Henry Clayton, Jr., and Francis Howlett, London, England. Application filed June 17, 1873.

The feeding-worm, kneading or masticating blades, and delivery-worm, with the cylinder which contains them, constitute a compound compressor and masticator, in which the peat (previously compressed by the rotating arms of the upright hopper) is masticated while it is in the compacted state resulting from its delivery, by the slow-pitch delivery-worm being less rapid than its feeding movement by the feeding-worm.

Claim.—1. The improvement in the art of manufacturing peat, substantially as before described, consisting of the following operations, viz: First, the compression of the peat. Second, the kneading or masticating of the peat while it is compressed or compacted. Third, the compression of the masticated peat into a continuous sheet. Fourth, the division of the said sheet into bricks, the said operations being performed successively in the order in which they are stated.

2. The combination, substantially as before set forth, of the following apparatus, viz: The upright hopper with its propelling-blades, the compound compressor and masticator, the molding-orifices, and the chopping-wire.

3. The combination, substantially as before set forth, of the following apparatus, viz: The compound compressor and masticator, the molding-orifice, and the roller-table with its trays.

4. The combination, substantially as before set forth, of the following apparatus, viz: The compound compressor and masticator, the molding-chamber, the series of molding-orifices, and the agitator in the molding-chamber.

5. The relative arrangement, substantially as before set forth, of the car-track, the upright hopper, the compound compressor and the masticator, the molding-orifices, and the roller-table.

143,618.—Clock-Calendar.—Arnold Frankfeld, New York, N. Y. Application filed April 26, 1873.

A four-year wheel with forty-eight teeth, and having the intervening spaces of varying depths, so as to form a pattern-wheel of the months, for the leap-year cycle, is hung upon the arbor of the month-wheel, with which it is connected by a lever pivoted thereto, which carries a pin engaging with the teeth of said four-year wheel, and disengaged by a stationary cam or projection on the frame-plate, at each complete monthly revolution. The outer end of the said lever projects more or less, according to the depth of the engaging recess, so as to allow a supplementary tooth on the twenty-four-hour arbor to move the month-wheel the additional amount required by the shorter months.

Claim.—The month-wheel *c* and year-wheel *e*, moving on the same arbor, in combination with the lever-dog *g* and propelling-pallets *a b*, the year-wheel *e* being constructed with spaces of varying depth, substantially as set forth.

143,619.—Double Stop-Movement for Watches.—Arnold Frankfeld, New York, N. Y. Application filed April 28, 1873.

A watch has two extra sets of stop minute and second hands, which sets may run independently of each other, or together, by engagement of their operating-wheels with the main train, effected by separate push-pins.

Claim.—The second-hands 1 and 2, connected, respectively, with the minute-hands 10 and 6, in combination with the double stop mechanisms and their respective push-pins, substantially as and for the purposes set forth.

143,620.—Plow.—Leonard C. Frost, Fredericksburg, Va. Application filed July 22, 1873.

For adjusting the beam of the plow vertically a cuff or clasp connected to the slanting standard surrounds the beam, engaging with a grooved plate, which is kept in position upon the side of the beam by a projection or tent, which enters the wood, allowing the plate to turn adjustably.

Claim.—1. The combination of a cuff and grooved iron, constructed substantially as herein described, with the beam and standard of a plow, as and for the purpose herein set forth.

2. The grooved iron A, having a tent upon its rear side, as and for the purpose substantially as described.

143,621.—Tag-Fastener.—John M. Goodridge, Norfolk, Va. Application filed August 16, 1873.

A double-barbed hook having a cross-bar at right angles to its shank, over which the tag is folded when the fastener is inserted.

Claim.—The combination of a hook having the cross-bar C with a tag, A, the two being connected as shown and described.

143,622.—Process of Preserving the Stubble of Sugar-Cane from Decay.—William Green, New Orleans, La. Application filed June 30, 1873.

Immediately after the cane is cut the stubble is cut smoothly near the surface of the ground and covered with three or four inches of soil, by which means the vitality of the stubble is preserved for the growth of the succeeding crop.

Claim.—The process of treating the stubble or stalks of sugar-cane, in the manner herein described, for the purposes set forth.

143,623.—Edge-Protecting Welt for Boots and Shoes.—John Green, Brooklyn, assignor to himself and Joseph Bach, New York, N. Y. Application filed September 6, 1873.

Claim.—The welt A for the protection of the shoe-upper, formed of a long narrow strip of leather or other material rabbeted on the upper side to receive the upper, and bent or molded to conform to the shape or outline of the sole, substantially as specified.

143,624.—Child's Carriage.—Lucinius Havasy, Hoboken, N. J. Application filed May 24, 1873.

The body is arranged so as to swing.

Claim.—The combination, with body A, of the arms B, rod C, standards D, frame F G, springs H, and frame E, all constructed and arranged substantially as and for the purpose described.

143,625.—Refrigerator and Cooler.—Canada D. Hicks, Bowling Green, Ohio. Application filed September 27, 1873.

The box is provided with doors in front and each end of its top, and is lined with galvanized iron or equivalent. In the middle of the box is placed a refrigerating-chamber made also of galvanized iron, which is so supported as to leave a space entirely around it, said refrigerating-chamber being designed to receive meats, bottles, &c. In the space at the ends of the box are placed vessels to receive ale, beer, &c., said vessels being so arranged as to leave space sufficient for ice, the space beneath the central refrigerating-chamber containing the ice-water.

Claim.—The outer box or case A B, the inner cooling-box C, and the cooling-vessels D, constructed and combined with each other, and provided with pipes and faucets, substantially as herein shown and described.

143,626.—Divided-Nut Device for Feed-Screws.—Frank A. Huntington, San Francisco, Cal. Application filed May 3, 1873.

The halves of the divided nut are opened and closed around the feed-screw by means of the inclines D passing under cleats on the sides of the nut.

Claim.—1. In combination with the divided nut C, the inclined planes D D, when constructed to operate upon the half-nuts by means of the lugs E, or an equivalent device, substantially as and for the purpose herein described.

2. The inclined planes D D, having the arms H, in combination with the operating-lever I, when constructed to open and close the half-nuts C, substantially as and for the purpose herein described.

3. In combination with the arm H of the inclined planes D D and the lever I, the spring J for retaining the planes in an elevated position, substantially as and for the purpose herein described.

143,627.—Cosmetic-Bottle.—Mary H. Huntington, Watertown, N. Y. Application filed September 27, 1873.

A cup is formed upon the bottle above its neck, and has an opening upon the side. When the bottle is lying upon its side this cup receives and holds a part of its contents for use.

Claim.—The combination of a cup, B, with a bottle or its stopper, having connection with the bottle, so as to receive and hold some of the contents of the bottle when the latter is placed on its side, and to return it to the bottle again when placed upright, substantially as specified.

143,628.—Child's Carriage.—John G. Kamphaus, Pittsburg, Pa. Application filed August 16, 1873.

Designed to avoid concussion and jolting.

Claim.—The bolster B, spring-block D, spring H, and rods G G, combined and constructed substantially as shown and described, for the purposes set forth.

143,629.—Mold for Glassware.—George H. Lomax, Somerville, Mass. Application filed July 30, 1873.

Molds the handle onto the blown ware before the ware is withdrawn from the mold, by means of the reservoir K, presser L communicating with handle-mold E.

Claim.—In a mold or apparatus for producing blow-over glassware, the combination, with the body-matrix, of the font or chamber K, presser L, and the handle-matrix provided with gates, substantially as described.

143,630.—Registering Steam-Gage.—Philo Maltby, Cleveland, Ohio. Application filed April 10, 1872.

An arm, attached to the index-spindle at the back of the gage, carries a screw pivoted at its extremities, so as to turn freely in its supporting-brackets. A small spur-wheel is connected with the screw at one end, so as to turn with it only in one direction; and when it is carried by the arm, under the sway of the steam pressure, past a stud out to a given limit of arc, the spur-wheel is turned, and with it the screw, thereby moving outward a traveling nut which holds a pencil, and thus marks, by an offset in the curve of oscillation, when the arm has been carried, by an excess of steam pressure, beyond the prescribed limit.

Claim.—The combination, in a gage, of the arm W, attached to the spindle H, screw W', spur-wheel X, steel point *y*, and its slide, with the pins *z* and the whiting or other coated glass of the case, all as and for the purpose specified.

143,631.—Wheel-Cultivator.—James F. Matchett and Perry W. Smith, Paris, Me. Application filed June 7, 1873.

The joints which unite the tongue, elevated axle, cross-bar, and posts are pivoted so that each side has a forward and backward movement, one side of the machine being retarded in proportion as the other is advanced, the wheels in all cases being parallel with the line of draft.

Claim.—The double bow C C, tongue D, cross-bar E, and arms F, all pivoted together and moving freely upon each other, in combination with the bent sectional axles B B, as and for the purpose described.

143,632.—Picket-Fence.—Robert H. McGinty, Moulton, Tex. Application filed May 17, 1873.

Pickets with wire stringers near top and bottom, embraced by links, are arranged in zigzag form, their tops inclining inwardly, with intermediate high posts inclining so as to form straight line for a wire-rider.

Claim.—The combination, with high posts and wire-riders, of stakes D, arranged in alternately reversed angles and with a wide post, B, at the vertex of these angles, but extended out alternately on opposite sides, as and for the purpose described.

143,633.—Mop-Holder.—Elon M. Naramore, Underhill, Vt. Application filed August 4, 1873.

A lateral head-piece is attached to the mop-stick, between which and a wire-clamp the mop is held. The wire-clamp is provided with coiled springs, which swing sidewise on pivots of the head-piece, and also with upward-extending parts, which are hooked to the sides of the handle.

Claim.—In combination with handle A and mop-head B the clamp C, which swings on pivots *d* of head B, and holds, by its spring action, the mop tightly thereon, substantially as and for the purpose described.

143,634.—Apparatus for Compressing Air.—Richard S. Pardee, San Diego, Cal. Application filed August 16, 1873.

A large chamber of suitable size and shape is placed in the surf so that the open end will receive the waves as nearly in a direct line as possible. The other end of the chamber has two passages, one of which communicates with a reservoir and has a valve opening outwardly, the other communicates with the open air and has a valve opening inwardly.

Claim.—The pressure-chamber A, provided with the two passages B and D, with their outwardly and inwardly opening valves C and E, the whole forming a hydropneumatic engine to be operated by the waves of the sea, substantially as herein described.

143,635.—Amalgamating-Pan.—Ira S. Parks, Virginia City, Nev. Application filed December 11, 1872.

Improvement on patent 113,791, April 18, 1871.

Claim.—The amalgamating-pan A, provided with the mullers B C, driven in the same direction, substantially as and for the purpose set forth.

143,636.—Car-Coupling.—Jason H. Payne, Roseville, Minn. Application filed May 17, 1873.

From a bent lever pivoted to the top of the draw-head depends a lever, which, when struck by the link, will force back the plate which holds up the pin; and the spring which holds the pin down, pressing on one arm of the bent lever, throws up the other arm, and with the depending lever so that it will be out of the way of the link after coupling is effected. This lever has a rule-joint near its lower end to allow of the link passing freely out of the draw-head. The operating parts of the coupling above the draw are covered by a hinged cap.

Claim.—1. The combination of the bent lever K, trigger-lever I, and spring H, substantially as shown and described.

2. The combination of the jointed trigger-lever I with the slide E and spring F, as shown and described, for the purpose specified.

3. The cap O, hinged at its rear end, and arranged to cover and protect the necessary coupling devices on the upper side of the draw-head, as set forth.

143,637.—Manufacture of Iron and Steel.—Edgar Pencham, Antwerp, N. Y. Application filed September 20, 1872.

The dross or cinder arising from the pig is drawn off either continuously or from time to time and replaced by a substance which will produce a pure cinder, or one free from the impurities common to the cinders arising from the pig.

Claim.—1. The process of purifying iron and steel, during its manipulation in the catalan forge-fire or puddling-furnace, by using flux, substantially in the manner previously described.

2. The use of lean hematite or specular ore as a flux for purifying iron and steel during their manipulation in the catalan forge-fire or puddling-furnace, substantially as described.

143,638.—Car-Coupling.—Wells D. Post, Gadsden, Ala. Application filed May 31, 1873.

The link is guided by a spring. The hook is enlarged at its pivoting to prevent the link passing beyond it and too far into the draw-head, and a spring is placed above the hook to keep it down in place.

Claim.—The draw-head A, springs D E, and hook C C C, combined, constructed, and relatively arranged as and for the purpose described.

143,639.—Lubricator.—John McLure Power, Port Discovery, Washington Ter. Application filed June 7, 1873.

Claim.—1. A transparent tube, J, connected with pipe-section B by end thimbles, in the manner and for the purpose described.

2. The combination, with a steam-forcing cup, A E H, and a pipe, B, leading to the part to be oiled, of an intermediate cross-pipe, C, having a glass, F, at each end, as and for the purpose set forth.

143,640.—Mechanism for Transmitting Power.—John Rankin, Binghamton, N. Y. Application filed December 11, 1872.

The friction-wheel, mounted on the shaft to be driven, is confined between the two similarly-shaped adjustable driving-wheels, which are provided with annular flanges for the retention of the belt, which passes over their periphery.

Claim.—1. The flat-faced, belted, and frictional driving-pulleys, when combined with the wheel to be driven, so as to hold it in equilibrium between the opposing driving-surfaces, and provided with the means described for holding the belt on, the whole constructed to operate substantially as set forth.

2. In combination with the belted and frictional driving-wheels and the interposed wheel to be driven, the combined set-screw holding devices, the whole arranged to operate substantially as and for the purpose described.

143,641.—Cotton and Hay Press.—David Reynolds, Prospect, Md. Application filed September 10, 1873.

The press-box has a door on top, which is opened and closed by the hand-lever, and a door on each side shutting outward and downward. From the follower extend two rods, which are connected with clutch mechanism. After the compression of the bale the follower is lowered by means of a rope connected therewith, passing over a roller and down within reach of the operator.

Claim.—The hay and cotton press consisting of the frame a, having the doors b g', levers c m, loops l c, rings n 3, link 5, arms 2 4, follower 1, roller 6, and rope 7, the parts all being combined and arranged for operation substantially as shown and described.

143,642.—Governor for Steam-Engines.—Carl Robert Rundvist, Stockholm, Sweden. Application filed February 15, 1873.

A variation in the speed of the engine increases or decreases the amplitudes of the oscillations of the pivoted plate, which latter transmits its motion synchronously to the weighted rod, by which the governor-valve is operated.

Claim.—1. The oscillating plate A and radial arms m n, combined with the shaft E and weighted lever F, substantially as and for the purpose described.

2. The weighted bar F, arranged in conjunction with the sliding shaft E and plate A, for the purpose specified.

143,643.—Bee-Hive.—John H. Shook, Normal, Ill. Application filed May 31, 1873.

The honey-frames and the comb-frames proper are supported upon the same perpendicular end piece, which is hinged to the external case.

Claim.—The honey-frames L, supported on the comb-frames K, as shown and described.

143,644.—Combined Indicator and Safety-Valve.—John Smith, Old Ford, England. Application filed February 11, 1873.

When the valve is first raised by pressure the escaping steam sounds a whistle. A further lift of the valve stops the whistle, the steam escaping through the hollow valve-stem, the spring inclosed in a perforated casing.

Claim.—1. The perforated cover U, plate S', and lock-case I, arranged in connection with the bolts and nuts, and with respect to the spindle and spring, as described, so that the air may circulate freely in contact with the spring and deprive it of its caloric, while no essential part can be tampered with.

2. The lever N, having the valve *n*, in combination with the valve-spindle C and the seat *j* of a whistle, substantially as and for the purpose described.

143,645.—Belt and Rod Cutter.—Lewis H. Smith, Stryker, Ohio. Application filed June 7, 1873.

The sliding cutter is provided with a friction-roller, upon which the cam-lever operates. A curved lever, fulcrumed at its middle, is connected to the main bar, one end of which bears upon the friction-roller, and the other end bent to cause the handle to press against it and separate the cutters.

Claim.—1. The combination of main cutter-piece A, sliding cutter C, eccentric lever D E, and curved lever F, substantially as specified, and for the purpose set forth.

2. The sliding cutter C, consisting of sleeve *c*, cutter *f*, arm *g*, and roller A, as specified.

143,646.—Car-Coupling.—Oscar Taylor, Grand Rapids, Wis. Application filed June 26, 1873.

The top portion of the draw-head is pivoted to the bottom portion, and is provided with rounded projections, which fit in corresponding grooves in the lower portion. A spring is attached to the lower portion in such a manner that when the upper portion is raised it will throw the arrow-head out of connection.

Claim.—The combination of the part A, provided with the recesses a^1 a^2 and square shoulder a^3, the part B, provided with the projections b^1 b^2 b^4 and the inclined or hooked shoulder b^3, and the springs E and F, substantially as herein shown and described.

143,647.—Piano-Action.—Frederick L. Traysser, Maysville, Ky. Application filed February 15, 1873.

To increase the ease of rapid repetition.

Claim.—1. The combination of the back-check and repeating attachment G I with the hammer and jack of a French grand action, when said parts are constructed and arranged substantially as specified.

2. The arrangement of the heel K of arm G, relatively to the head of the rod I, as described, to prevent the rebound of the key, substantially as specified.

143,648.—Pitman-Rod.—Samuel N. Wate, Jr., Danville, Pa., assignor to himself and Peter J. Adams, same place. Application filed September 6, 1873.

Capable of being adjusted to the distance between the wrist-pins.

Claim.—The rotary nut P, stationary screw M, and blocks I, combined with the straps B C, bolts N J, rod A, and brass F, as and for the purpose described.

143,649.—Evaporating-Pan.—David Watson, Mexico, Mexico. Application filed August 4, 1873.

The juice containing impurities flows into a channel and then into a filter, both on the outside of the evaporating-pan, from whence the filtered juice flows back into the pan. The juice is heated by steam passed through a coil of pipe in the bottom of the pan.

Claim.—The evaporating-vessel A, provided with the trough B around the top, and with the filter C, which communicates with said vessel by means of the passage D, as shown and described.

143,650.—Jig-Saw.—Marvin E. Weller, Fort Plain, N. Y. Application filed August 16, 1873.

The saw is connected to the cross-head by jaws so arranged as to allow of its ready removal or adjustment.

Claim.—1. The plate D having handle H, and the bar G connected with said plate by pivoted arms I, combined with arm F having the stud J, as and for the purpose set forth.

2. The spring T, and lever U, and rack V, when combined with jaws R R, movable against inclines S S, as and for the purpose specified.

143,651.—Register and Indicator.—Edward P. Wheeler, Corinth, Miss. Application filed September 25, 1873.

The impelling-rod of a distance-register is arranged with a stop and yielding trip, so that it can move the ratchet-wheel but one tooth at each revolution of the car-axle.

Claim.—1. The combination with the ratchet-wheels b b' and c, of a register for cars, vehicles, and other purposes, rod G, having a limited motion, and lever F, through which said rod projects, supported by spring D, as described, and for the purpose hereinbefore set forth.

2. The combination, with rod G, having limited motion, of spring D, lever F, and collar E, substantially as and for the purpose set forth.

143,652.—Feed-Gage for Printing-Presses.—Gordon Wilcox, Norwich, Conn. Application filed July 17, 1873.

The arm is made adjustable by means of the screw I and set-screw K. The side guide is attached to the feed-board by a dovetailed sliding joint, and is provided with an adjustable point, N.

Claim.—1. The combination of the cylinder E, slide H, adjusting-screw I, and set-screw K, as a front guide for a cylinder-press, substantially as described.

2. The combination of the cylinder E, slide H, adjusting-screw I, set-screw K, adjustable screw-point N, and post L, dovetailed upon the bar O, as a side guide, substantially as herein set forth.

143,653.—Watch-Key.—Francis E. Allen and Samuel G. Hall, Keene, N. H. Application filed August 15, 1873.

The pipe of a watch-key may be reversed in a socket in the handle, and is keyed from slipping while winding.

Claim.—The holder A having the longitudinal slot D, in combination with the removable and reversible key-barrel B having the lateral stud C, all constructed and arranged to operate substantially as and for the purpose specified.

143,654.—Distilling Pure Alcoholic Spirits.—Christian Andemark, Brooklyn, N. Y. Application filed July 17, 1873.

A double-acting pump is placed between the vessel which receives the liquids condensed from the mash-tuns and a vessel filled with animal or other charcoal. The suction-end of the pump assists in drawing off the vapors from the mash, and forces the condensed liquid through the charcoal, which purifies it. The spirit then goes to the rectifying-column, from which is produced pure neutral spirits.

Claim.—1. The arrangement of a double-acting pump, H, in combination with a set of mash-tuns with a receiving-cistern, G, a carbon-vessel, K, and a rectifying-still, O, all constructed and operating substantially in the manner herein shown and described.

2. The within-described process of distilling alcoholic liquids by forcing the products resulting from the vaporization of mash through a vessel containing carbon previous to introducing said liquid into the rectifying-still, as set forth.

143,655.—Sash-Holder.—Samuel I. Anderson, Philo Walden, and Ezekiel P. More, West Eaton, N. Y. Application filed September 20, 1873.

Claim.—The two-part frame A A, constructed with a recess, a, an inclined back, a^1, seat a^2, and inclined grooves b b, adapted to receive the friction-wheel B and its axis c, in combination with the shouldered hole f for receiving the spring-bolt C, as herein described and shown.

143,656.—Manufacture of Globe-Holders.—C. Henry Barney, Providence, R. I., assignor to George Mooney and James Shaw, Jr., same place. Application filed June 23, 1873.

The blanks are cut from sheet metal, with the several arms occupying parallel lines, and are then bent to the proper radiation by suitable dies.

Claim.—1. The method, substantially as described, of constructing radial-armed globe-holders, which consists in cutting them in one piece from sheet metal, with the several arms occupying parallel lines, and then bending them so as to occupy the requisite radial lines, as and for the purposes specified.

2. The cutting-die, substantially as described, for cutting blanks for radial-armed holders, with which the several arms can be cut on lines which are parallel, as and for the purposes specified.

143,657.—Mail-Pouch Holder and Catcher for Railroads.—Benjamin F. Bean, Pawling, Pa. Application filed May 16, 1873.

The crane by which the bag is supported is arranged to swing back automatically out of the way after the bag is removed.

Claim.—1. The crane A, provided with the hinged arm c, handle e, and spring g, in combination with the support or socket having the notched cam f, when arranged to operate substantially as herein shown and described.

2. In combination with the crane A, provided with the arms b c, the springs i, having their ends forked, and so constructed that said ends can play freely in all directions, as set forth.

3. The swinging frame D, consisting of the rod l, bar m, jaw E, and brace o, when attached to side of the car in the manner shown, and for the purpose set forth.

143,658.—Bag-Holder Weighing-Scale.—Azel H. Bell, Cedar Falls, Iowa. Application filed February 15, 1873.

The hinged top or platform of a scale mounted on a stand has on its under side hinged arms with grooved clamps so arranged as to hold open the mouth of a sack when the platform is raised to a vertical position, and thus to weigh its contents conveniently, while the top or cover, when down, forms the platform of an ordinary weighing-scale.

Claim.—1. In a bag-holder, the grooved bars I and pivoted bars J, attached to the platform E, for holding the mouth of the bag, substantially as shown and described.

2. The combination and arrangement of the platform E, bars B D, and scale-beam C, substantially as shown and described.

3. A platform-scale, having its platform E hinged to revolve upward, forming the supporting-arm of a bag-holder, substantially as specified.

143,659.—Pruning Implement.—Alexander P. Bettersworth, Carlinville, Ill. Application filed June 23, 1873.

Claim.—1. The combination, with the handle d, of the double levers f f and g g, the hook a provided with shank c, having a fulcrum connection with the levers g g at i i, and the sliding cutter b, all arranged as shown and described.

2. The combination of the spiral spring k, with the handle d, double levers f g, hook a, and sliding cutter b, as shown and described.

143,660.—Plow.—William Blackstone, Shelby county, Ill. Application filed July 25, 1873.

By a rock-shaft and lever, with slotted crank-arm, the rear of the plow is raised or lowered and permitted to move laterally, a rear hook working in the slot. The front end of the beam is operated by a long lever extending back to the workman, another vertically-jointed lever or handle attached to the beam serving to adjust the plow laterally by means of a horizontal rack-bar.

Claim.—1. Rock-shaft and lever B, with its slotted arm B', in combination with the plow-beam and rear connecting-hook, as and for the purpose described.

2. Lever No. 6 and connection P, in combination with lever No. 5, with joint S, and the plow-beam, as and for the purpose described.

3. The combination of the plow-beam, the rock-shaft, and lever B, levers 5 and 6, with their connecting-joints and slots, and ratchets 9 and k, as and for the purpose described.

143,661.—Hydraulic Hose.—Lyman R. Blake, Brooklyn, N. Y. Application filed March 24, 1873.

Claim.—The improvement in the manufacture of hydraulic hose consisting in first uniting the edges of the strip, as described, to form the tube, and then turning the tube, as described.

143,662.—Reducing Ores.—James H. Boyd, Chicago, Ill. Application filed April 4, 1873.

The fuel is placed in a coking-chamber to drive off the gases. The hot coked fuel is raked into a combustion-chamber, the flame and gases passing into a reducing-chamber, and thence to a roasting-chamber.

Claim.—1. The combination and arrangement of the coking-chamber A a, the combustion-chamber B, the reducing-chamber C with its separating-hearth, and the roasting-chamber D, substantially as specified.

2. In combination with a reducing-chamber or separating-hearth, the conduit or pipe M located substantially as specified, the overflow-pot N, and receiving-vessel P, substantially as specified and shown.

3. The combination and arrangement, substantially as specified, of the chambers A B C D, condensers E G, and fan F or its equivalent.

4. The combination of the fan F with a reducing-furnace provided with a condenser or condensers, substantially as specified, located in the rear of said furnace.

143,663.—Electric Apparatus for Signaling Between Railway-Trains.—Robert K. Boyle, New York, N. Y. Application filed August 28, 1873.

Arrangement of circuits, &c., substantially same as in Boyle's patent of August 12, 1873, substitutes soft-iron forked armature D for polarized armature of that patent in the switching devices.

Claim.—The soft-iron switch D, situated between two electro-magnets, C C^0, in combination with insulated anvils G G^0 G^a and sectional line-wires 16 17 18, &c., on the side of a railroad-track, and with keys g g^0 g^a, or their equivalents, attached to a locomotive, the whole constructed and operating substantially as shown and described.

143,664.—Spark-Arrester for Locomotives.—Michael Brassill, Hartford, Conn. Application filed August 27, 1873.

The large sparks and cinders are driven in contact with the corrugations upon the deflector, and thereby breaking them into small particles, thus avoiding the danger of damage by fire.

Claim.—The combination, with the head D D', of the smoke-stack A, having openings a a, rods B B, adjustable deflector C, with corrugations z z, and the screen E', all constructed and arranged substantially as and for the purposes herein set forth.

143,665.—Device for Forming Water-Traps.—William A. Butler, New York, N. Y. Application filed September 23, 1873.

The teeth of the bending-roller mesh with the teeth of the semicircular rack, causing the roller to rotate on its own axis at the same time it is carried around the material.

Claim.—The machine for bending tubes, forming water-traps, &c., consisting of the stationary semicircular grooved block A, grooved and toothed roller C, stationary gearing B, and fork or lever D, all combined and arranged to operate substantially as herein shown and described.

143,666.—Rotary Brush.—George Carlisle, Attleborough, Mass. Application filed July 3, 1873.

A metallic disk having concentric shoulders with holes or openings to receive the bristles, said bristles being confined in place by a wire running along said shoulders.

Claim.—A rotary brush composed of the metallic disk A, having the concentric shoulders h h, and holes or openings a a b b, for receiving the bristles B, said bristles being confined in place by the wire l, substantially as described.

143,667.—Corn-Husker.—George W. Care, Philadelphia, Pa. Application filed July 24, 1873.

Two rollers revolving in opposite directions, having longitudinal ribs and transverse grooves, so made that a groove in one is midway between two in the opposite roller.

Claim.—The within-described corn-husking rollers having recesses and intermediate teeth extending from recess to recess, and so arranged that the recesses of one roll shall be opposite to the teeth of the other roll, all as set forth.

143,668.—Rein-Holder.—John W. Clark, Pittsburg, Pa. Application filed March 31, 1873.

Claim.—1. The frame a, having stops A on the outer ends of the outer bars d to prevent the rein from slipping out of the slots, substantially as described.

2. The rein-holder, consisting of the frame a, with stops A, and the hand-loop f, substantially as and for the purposes described.

143,669.—Carriage-Top Joint.—John H. Combs, Stamford, Conn. Application filed June 7, 1873.

Claim.—The joint-sections A B, in elliptical form, in cross-section, in combination with the brace-rods D, of corresponding form, made adjustable and secured by set-screws, substantially as and for the purpose specified.

143,670.—Machine for Making Curved Earthen Pipes.—Ralph Connable, Jackson, Mich. Application filed September 24, 1872.

Mouth of die capable of adjustment so as to vary relative size of efflux upon either side of central dod.

Claim.—1. A machine for making curved pipes combining in its construction the following instrumentalities, viz: A die for forming the emerging plastic material into pipe, mechanical means, substantially such as described, for forming curvatures in the pipe by increasing or diminishing the velocity of efflux on different sides of the pipe-former, and means for instantly shifting the resistance from side to side without stopping the machine.

2. The core C and case D, combined with a lever, F, for adjusting them laterally with reference to one another, substantially as and for the purpose specified.

143,671.—Process of Making Curved Earthenware Pipes.—Ralph Connable, Jackson, Mich. Application filed August 22, 1873.

Claim.—1. The art of making curved pipes by forcing the plastic material from a receiver through an annular aperture contracted or obstructed on one side.

2. The method of making pipes from a plastic material with curves regulated at the will of the operator by varying the relative rate of discharge of the material on different sides of a pipe-forming die while issuing therefrom in a continuous stream.

143,672.—Striker for Paper-Ruling Machines.—James D. Connolly, Lincoln, Neb., assignor of one-half his right to Richard Doyle, Peoria, Ill. Application filed May 9, 1873.

The rear end of the pen-carriage is provided with dovetail blocks, into the recesses of which adjustable bracket-shaped posts are fitted, the lower ends of which are pivoted to the rear ends of the striker-frame, while their forward ends are loosely connected with said frame beneath the pen-carriage, midway its length, whereby the frame may be raised from the paper when the carriage is elevated. The adjustable posts are connected by a removable bar parallel to the pen-carriage, and upon said bar blocks are fitted to move laterally, carrying thin pen-setter bars to elevate the pens independent of each other by adjusting-screws fitted thereto. The forward ends of the setter-bars rest upon a rod, which connects with the forward ends of the striker-frame.

Claim.—1. The removable posts b b, provided with set-screws 1 1, in combination with blocks D D attached to the pen-carriage C, and removable bar F, all constructed and arranged to operate substantially as and for the purpose set forth.

2. The rods m m, adjustable by means of screws p p, and arranged to work in slots of blocks G G, which are laterally adjustable upon the removable bar F, having set-screws to hold the said blocks in position, all constructed to operate substantially as and for the purpose set forth.

143,673.—Culinary Boiler.—James H. Corey, New York, N. Y. Application filed May 29, 1873.

Claim.—The combination of the vessel A, globular chamber B, bent pipe C, and discharge-pipes D and H, all arranged to operate substantially as described.

143,674.—Paper-Bag Machine.—Luther C. Crowell, Boston, Mass. Application filed August 25, 1873.

The paper is cut longitudinally, intermittently pasted by the paste-wheels and scraper, the edges then being folded under and paste applied to them. Thence it passes over the cylinder c^2, between it and the cylinder f^2, when the bottom is folded, the bag-length cut off, and the edges pressed together. Then the bag passes over the printing-roll to the table, where it is automatically removed and counted.

Claim.—1. In combination with the paste-wheels o p, the doctor-bar t, intermittently brought into contact with such wheels, substantially as described.

2. The combination of the ratchet o^3, pawl n^3, guard s^3, pawl r^3, wheel p^3, and rocker-shaft m^3, for operating the bag-removing mechanism, substantially as described.

3. The combination of the paste-rolls o p, the intermittently-acting doctor t, the folding-fingers z, and rolls h g, substantially as and for the purposes set forth.

4. The combination of the paste-rolls a^2 b^2 with the cylinders c^2 f^2, substantially as shown and described.

5. The cylinder c^2, provided with the folder-bars n^2 and cutter-bars k, in combination with the cylinder f^2, and its jaws r^2 s^2, and edge v, substantially as shown and described.

143,675.—Gas-Retort.—Darius Davmon, New York, N. Y. Application filed April 9, 1873.

The core G is the return-pipe B causes the gas to spread into a thin stratum, and thus brings it into close contact with the heated surfaces of these pipes, by which the vapors passing from the retort are converted into gas. The core G is made removable, so that the condensed carbon may be readily cleaned from it.

Claim.—1. The arrangement, substantially as specified, of the pipe or opening C with the main retort A and return-pipe B, whereby the connection between said retort and return-pipe is established at or near the center of the retort.

2. The mouth-piece D, cast in one piece, and constructed to form upper and lower chambers D^1 D^2, provided with separate lids F F, in combination with the main retort A, the return-pipe B, and stand-pipe E, substantially as specified.

3. The drip-box M, formed by a depression of the upper chamber D^1 of the mouth-piece, in combination with the return-pipe B and stand-pipe E, essentially as herein described.

4. The gas-distributing core, pipe, or tube G, closed at its back end, and constructed to rest, at its bottom, upon the lower interior surface of the return-pipe B, leaving a gas or vapor space, A, at its sides and top, and arranged, in relation with the return-pipe, for use in concert with the main retort A, substantially as specified.

143,676.—System of Purifying Water Chemically and Mechanically.—Gustave Demailly, Brussels, Belgium. Application filed March 22, 1873.

The stream of water to be purified is first mixed with a stream of lime-water to precipitate the salts held in solution, by a wheel so constructed as to draw the lime-water from the producer, and at the same time to mix the two streams. The water then passes through a filter.

Claim.—The combination of the pipe A, lime-water producer B, wheel *d d'*, and filter D, substantially as and for the purpose set forth.

143,677.—Fire-Escape.—Carl Dietrich, Boston, Mass. Application filed August 13, 1873.

The extensible standards steady the series of lazy-tongs, and the braces at each corner of the lower platform steady the structure when elevated.

Claim.—1. The combination of the four braces U and their sustaining-ropes *l* with the platforms A F, lazy-tongs B B' and their operative nuts C C', and screws D D', arranged and applied together substantially as specified.

2. The combination of the four extensible standards O O O O, substantially as described, with the two platforms A F, the lazy-tongs B B' and their operative nuts C C', and screws D D', arranged and applied together substantially as specified.

143,678.—Harness Attachment for Hitching and Unhitching Horses.—Thomas J. Doble, Weehawken, N. J. Application filed August 21, 1873.

Claim.—1. The combination of the freely-vibrating and longitudinally-moving buckle G with the traveler-rod H and stock or body of the piece C carrying said rod, substantially as and for the purposes herein set forth.

2. The saddle-piece C, with its trace-rod E, controlled by a spring, *f*, traveler-rod H, and buckle G, in combination with the bed or shaft piece A and spring bolt or catch D, substantially as and for the purposes specified.

143,679.—Electric Vote-Announciator.—Thomas B. Doolittle, Bridgeport, Conn. Application filed July 28, 1873.

Circuit-closing key at each desk, swinging numbered plate in a frame corresponding to each desk. Closing key allows plate to fall, and at same time releases a ball, which rolls into a graduated glass tube. Secondary apparatus at another point may be put into same circuit, so as to announce vote at a distant place.

Claim.—1. The combination, in a voting apparatus, of the number-disks and ball-tubes, controlled and operated simultaneously through the medium of electricity, substantially as and for the purpose set forth.

2. In combination with the drop D, the prop P, armature A, and its magnet M, operating substantially as described, and for the purpose set forth.

3. In combination with an electrical voting apparatus, secondary indicating apparatus, in the same circuit with the voting apparatus, to indicate the state of the vote at other points, substantially as described, and for the purpose set forth.

4. The combination, with the recessed shaft *s* and ball-receptacle R, of the conducting-tube T and graduated indicator-tube, substantially as and for the purpose set forth.

5. The indicator-pin *v*, in combination with the spring s^3 and detent *d*, operating substantially and for the purpose described.

143,680.—Car-Coupling.—George Edmonds, New Orleans, La. Application filed June 30, 1873.

When the cars are coupled the projections on the under side of one draw-head fit in the grooves on the upper side of the other. The coupling-bars are so attached to the draw-bars that they may have the requisite amount of play, both vertically and longitudinally.

Claim.—1. A coupling-bar having the head L, with the recess *e*, pin *f*, jaw A, and grooved and beveled upper surface *n*, substantially as and for the purpose specified.

2. The arrangement of the bar *a*, pivoted and supported in a stirrup having the vertical spring, as shown, and connected with the draw-head by the stirrup P and pin *r*, said draw-head having the step H, against which the rear end of the bar *a* oscillates, substantially as described.

143,681.—Gage for Marking Cloth for Cutting.—Eliza E. Egery, Boston, Mass. Application filed July 11, 1873.

A shaft or axle has mounted upon it two bevel-edged disks with collars through holes, in which spring-catches take into circular indentations, a series of which are arranged upon the spindle, allowing the disks to be adjusted at proper distances apart. By means of a handle at the middle of the spindle the disks are rolled over a piece of cloth, the creases left by the edges being guides to cut by.

Claim.—The rod A, with its handle B, in combination with one or more rotary marking-disks, *d*, made adjustable upon the rod, and held from moving longitudinally thereon by a suitable catch or catches, substantially as set forth.

143,682.—Machinery for Finishing the Sole-Edges of Boots and Shoes.—Hadley P. Fairfield and William W. Meserve, Jr., Boston, Mass. Application filed March 15, 1873.

The shoe or last is attached to an oblong plate, having gear-teeth meshing into and driven by gear-pinions, which engage with similar devices on a slotted plate, the pinions turning on pins projecting from a block, which alternately rotates with the shaft, and also receives a horizontal movement of the length of the shoe by means of a crank-pin in combination with the slotted sliding plate.

Claim.—1. The intermittently-rotating and horizontally-moving slotted plate *r*, guide and stop rail or rails b^2, and crank-pin slide *v* for imparting movements to the boot or shoe, substantially as described.

2. In combination with the plate *r*, rail or rails b^2, and crank-pin slide *v*, the arms f^2, and levers k^2, arranged to operate substantially as described.

3. In combination with the plate *r* having rotative and horizontal movements, the plate *d* geared to and driven by the plate *r*, substantially as described.

4. The rails b^2 and crank-pin block *x*, made adjustable, substantially as and for the purpose described.

5. In combination with the trimming-cutter mounted as described, the guide-roll c^3, arranged substantially as shown and described.

6. The trimming-tool and guide-roll attached to arms extending from the spindle g^3, said spindle having capability of vertical rotative and forward and back movement, substantially as shown and described.

143,683.—Cock.—James W. Faxon, Boston, Mass. Application filed September 25, 1873.

Around the upper end of a valve-stem is arranged a perforated chamber, in which the steam escaping from the valve is contained, and all dripping of the water of condensation therefrom and tarnishing of the valve prevented.

Claim.—The cup or chamber *g*, in combination with the valve or cock and its vertical spindle *d*.

143,684.—Revolving Horse-Rake.—Moses K. Flory, Viola, Ill. Application filed September 2, 1873.

A hood, constituting the hand-hold of the handle, has pivoted in its upper side the locking-rod, and is pivoted to the lower and upper corner of the handle, and when bent down so as to form an angle with the handle retracts the rod and permits the rake to revolve.

Claim.—The horn or hollow handle H, spring L, handle G, catch I, and latch J, all constructed and arranged to operate in the manner and for the purpose specified.

143,685.—Screw-Cutting Machine.—Maurice B. Flynn, Brooklyn, N. Y. Application filed September 17, 1873.

The work-holder is composed of a bed sliding on the frame of the machine, upon which is mounted a transverse sliding plate, into which is swiveled a circular plate, which carries the holding-jaws. The dies are held in position on the end of the mandrel by means of two pins entering notches in their peripheries and a cap having notches to work over pins on the periphery of the mandrel.

Claim.—1. In machines for cutting screw-threads, the combination therewith of a holder for the work, composed of adjustable jaws *n*, a swiveling jaw-carrying center plate, *i*, and a transverse adjustable carrier, A, for the jaw plate, for joint operation with the slide *f*, and having their adjustments effected essentially as and for the purpose described.

2. The die or dies *w*, notched as described, in combination with the holding-pins *z z*, the holding-cap *z*, and the mandrel *s*, essentially as described, and to obtain the advantages stated.

143,686.—Cracker-Machine.—Joseph Fox, Lansingburg, N. Y. Application filed April 10, 1873.

The crackers are fed by the endless apron to the pressing-dies, and are ranged and rowed by means of a notched plate. Said notched plate or guide is mounted on two arms, which slide in slotted curved uprights, so that the guide has a downward and inward movement, and then an upward and outward movement.

Claim.—1. In a machine for making crackers, the combination, with an intermittingly cracker-feeding apron, B, of a movable guide, G, which will both line transversely and range longitudinally the crackers fed upon said apron, essentially as and for the purpose described.

2. The combination, in such a machine, of a movable longitudinally-ranging guide, G, for the crackers with a series of pressing-dies, A, and an intermittingly-feeding apron, B, essentially as described.

3. A rowing and ranging plate for the crackers, operated to carry it both downward and inward simultaneously toward the pressing-dies and apron, and to recede therefrom upward and outward, for the purpose described.

4. In a cracker-machine, the combination therein of a movable ranging and rowing guide, G, constructed and operating substantially as described, with the pressing and finishing dies A, a dofing-plate, O, an intermittently-moving feeding-apron, B, and an intermittently-acting presser, P, the several parts being constructed and arranged for joint operation substantially as herein specified.

143,687.—Manufacture of Boots.—William H. Ferguson, Forest, Ill. Application filed February 11, 1873.

Claim.—The tongue C, having its upper edges splayed off and arranged to extend half-way up the leg A on the inside, in connection with the lining D, arranged to extend down from the top of the leg over the lining, all constructed in the manner and for the purpose as herein shown and set forth.

143,688.—Heel for Boots, &c.—John B. Gerrard and Charles G. Schwarz, Philadelphia, Pa. Application filed December 30, 1870.

Claim.—1. As a new article of manufacture, a heel for boots and shoes consisting of glass or its equivalent, and adapted to be applied and secured as set forth.

2. The combination, with the heel, of an elastic cap, *k*, between which and the sole the heel may be clamped, as described.

3. The cap *k*, applied to the heel and having a nut, *z*, embedded in a projection, *t*, for the purpose set forth.

143,689.—Cooling-Coil for Liquids.—William Gee, New York, N. Y. Application filed August 21, 1873.

The liquid first traverses the outer pipe of the left-hand coil, returning by the inner pipe, thence by the inner pipe of the right-hand coil, returning by the outer pipe. Between the inlet and outlet of the outer pipe a plug is placed to direct the circulation.

Claim.—1. The combination, in a coil-cooler, of two pipes, A B, arranged one within the other, substantially as herein described, whereby the liquid to be cooled will circulate through the two pipes in succession, and in reverse directions.

2. The cooler composed of the two coils, each consisting of an inner and outer pipe, and connected substantially as herein described, whereby the circulation is first through the outer pipe of one coil, then through the inner pipes of both, and afterward through the other outer pipe.

143,690.—Heel-Burnishing Machine.—Charles W. Glidden, Lynn, assignor to James W. Brooks, trustee, Boston, Mass. Application filed August 25, 1873.

Rotating heel-burnishers, moving in opposite directions, independent of each other, act intermittingly and alternately upon the same point for the purpose of securing greater solidity of outer surface.

Claim.—1. In combination with the mechanism for jacking the boot or shoe in position, the burnishers *i i*, acting alternately and in opposite directions against the heel-edge, substantially as described.

2. In combination with the heel plate *a*, the hinged jack or last-pin *c*, jointed to the slide *c*, substantially as described.

3. The burnisher-frames *h h*, each having a yielding or sliding burnisher, *i* or *i*, and slides *m m*, substantially as shown and described.

4. In combination with the rotating burnishers, the guide-rail *q* operating to press or keep forward the burnishers, substantially as described.

5. In combination with the rotating burnishers, the cam-plates *r* h^2 for drawing back the burnishers.

6. In combination with the burnisher-frame *h*, the guide-plate a^2, pinion c^2, crank c^3 d^3, and gear-racks g^3, operating to intermittently actuate the frame, substantially as described.

7. In combination with the burnisher-frames *h h*, the sleeves *g*, pinions *w t*, and gear-segment *u*.

143,691.—Electrical and Thermostatic Fire-Alarm and Circuit Therefor.—John H. Guest, Brooklyn, N. Y. Application filed September 1, 1873.

Circuit-breaker in a normally-closed circuit revolved by clock-work controlled by a thermostat. Series placed in ordinary closed circuit without interfering therewith.

Claim.—1. The lever-detent *g*, resting against or upon a bulb containing quicksilver or other expansible liquid, or against a spring controlled by said bulb, the parts being so arranged that the expansion of the liquid by heat will cause the breakage of the bulb, and the consequent release of the detent.

2. The combination of the frangible thermostat H, detent-lever *g*, clock-train B, signal-wheel *b*, spring *d*, and closed electric circuit w^1 w^2, as and for the purposes specified.

3. The combination, with a closed telegraphic circuit, of one or more signaling apparatus, controlled by thermostatic or any suitable heat-indicating device.

143,692.—Locking-Latch for Doors.—Edward Halsey, San José, Cal. Application filed May 17, 1873.

A weighted lever operates upon the latch through the medium of an arm, which is itself operated by a lever, with index-finger turned by the knob. The latch-shank is combined with shoe-shaped tumblers.

Claim.—The combination of the lever B, the index-finger *a*, the thumb *b* with the weighted lever D, the pivot F, the finger *e*, the shoulder *f*, and the bolt G, the shoulder A, the pin *h*, the elbow I, the pins *j j*, the tumblers J J J, the pivot K, the slots *l l l*, the elbows *m m m m m*, the toes *o o o o o*, the stop P, and key-stop *r*, substantially as and for the purposes hereinbefore set forth.

143,693.—Base-Burning Stove.—Alfred Hathaway, Freetown, Mass. Application filed July 12, 1873.

Claim.—1. The adjustable magazine D, having the outer or external legs *c c*, in combination with the shell B, having the annular flange *b* surrounding the upper end of the magazine, and the screws *d d* passing through said flange and lugs, substantially as shown, and for the purpose mentioned.

2. In a base-burning stove, the adjustable case H having external lugs *f f*, carrying the ash-box E and fire-pot G, in combination with the base A and adjusting-screws *h h*, substantially as specified.

3. The means for adjusting the case, consisting of the toothed wheels *i i*, endless chain *m*, and lever-wheel J, substantially as described.

143,694.—Electric Railway-Signal.—Stephen C. Hendrickson, Brooklyn, E. D., N. Y. Application filed December 26, 1872.

Signal-disk revolved continously in one direction by a motor. Movement controlled by two electro-magnets, each being in a circuit from opposite ends of a section. One circuit being closed, an armature is withdrawn from a pin on shaft of signal, allowing signal one-fourth revolution; when it is stopped by armature of second electro-magnet, which, operated from its end of rail-section, permits another one-fourth revolution.

Claim.—1. The combination of a signal or signal-disk G, actuated by suitable mechanism, with two or more detents, *n n'*, operated alternately or successively by electro-magnetism, automatically in the manner and for the purpose herein specified.

2. The combination of an indicator or alarm, either or both, with the actuation of a semaphoric signal, substantially as and for the purpose herein specified.

143,695.—Scrubbing-Brush.—Carl Herold, Pittsburg, Pa. Application filed September 9, 1873.

A water-tight metal box is attached to the top of the brush, to be filled with water or suds, having an inlet and an outlet hole. A finger over the former regulates or stops the flow.

Claim.—As a new article of manufacture, the herein-described fountain scrubbing-brush, the reservoir B of which is provided with an inlet-hole, *b*, under the convenient control of the hand manipulating the brush, substantially as specified.

143,696.—Draft-Equalizer.—William W. Herman, Elkhart Ill., assignor to William T. Wylie, same place. Application filed May 24, 1873.

Claim.—The bar A, curved as shown, and pivoted, at its center, directly to the beam B, with its ends turned, and provided with pins *b* and swivel-hooks *d*, in combination with the levers C C, with projections *e* and notches *f*, the pivots of the bar A and levers C C being on a line with each other, all as set forth.

143,697.—Composite Roofing.—Ralph S. Jennings, Philadelphia, Pa. Application filed September 26, 1873.

Claim.—A roofing or roof-covering composed of wire-gauze covered on both sides with tarred paper, as herein described.

143,698.—Fare-Box.—Tom L. Johnson, Louisville, Ky. Application filed October 4, 1873.

The lower edges of the glass plates rest against the rear side of the box to receive and hold the fare for inspection. The upper two plates are moved independently of each other by means of their levers. The lower lever is so arranged that it moves all three plates. A chute is operated by its lever so that fare may be directed into either of two boxes. The box is held together by the lock-bolt K.

Claim.—1. The fare-box herein described, consisting of the side pieces A A with dovetailed top B and bottom C, blocks E G G', glass plates D D' I, and door J, all as and for the purposes herein set forth.

2. In combination with the side pieces A A, the screw K having the square part *x*, the stationary plate *b*, and movable plate *d*, all substantially as and for the purposes herein set forth.

3. The hinged or movable chute L, operated by means of the lever M, for the purposes herein set forth.

4. The combination of the glass plates P P^1 P^2, rock-shafts *f f* with arms *s s* and cranks A A, the slotted levers R R^1 R^2, springs *i i*, and slotted sliding bar *m*, all constructed and arranged to operate substantially as and for the purposes herein set forth.

143,699.—Driver for Boot and Shoe Nailing Machines.—Asa S. Libby, Lawrence, Mass. Application filed August 14, 1872.

Claim.—The nail-driver made from round wire, having its driving end drawn into prismatic shape and hardened, substantially as described.

143,700.—Circuit for Printing-Telegraphs.—Landy T. Lindsey, Jackson, Tenn. Application filed March 26, 1873.

Each instrument has a ground-circuit which its own action breaks, throwing the circuit through next instrument of series, the instruments being thus brought successively into circuit.

Claim.—1. In a line of printing-telegraph having a series of instruments arranged in one circuit, the combination of a ground connection with each and every instrument of the series, substantially as and for the purposes herein set forth.

2. In a line of printing-telegraph having a series of instruments for operating the type-wheels, and a series of instruments for operating the printing mechanisms, the combination of a ground-connection with each and every printing-instrument through its type-wheel instrument, in such a manner that, as the lever of the type-wheel instrument completes its stroke, the said connection between the printing-instrument and the ground will be temporarily broken, for the purposes herein set forth.

143,701.—Regulator for Printing-Telegraphs.—Landy T. Lindsey, Jackson, Tenn. Application filed March 26, 1873.

Adds arm A and point B to regulator shown in patent No. 136,332, so as to restore main circuit with certainty once in every revolution.

Claim.—In combination with the correcting-wheel *g*, operating as described, the revolving arm A and point B, or their equivalents, for the purposes herein set forth.

143,702.—Printing-Telegraph.—Landy T. Lindsey, Jackson, Tenn. Application filed May 3, 1873.

Synchronism maintained by devices which break circuits of fastest-going instruments until all have reached a designated letter or space.

Claim.—1. The combination of the cam-wheel c^1 and the circuit-breaking bar *m* with insulating-roller *w*, for automatically breaking the circuit of the relay-magnet M, as herein set forth.

2. The combination of the cam-wheel c^3, circuit-changing bar a, with insulating-roller a', and the spring a^2, for closing a circuit through the magnet A^2 at the time when the unison-point is in contact with its stop, as herein set forth.

3. The combination of the lever h, prongs h^1 and h^2, with semi-hubs thereon, and the shifting-lever p, as and for the purposes herein set forth.

4. In combination with the printing-mechanism, the use of the magnet A^1 and its local circuit, controlled by a relay-magnet, for actuating the printing apparatus, as herein set forth.

143,703.—Domino.—BAZILE LOUINEAU, Sables D'Olonnes, France. Application filed February 28, 1873.

The spots upon the tablets are differently arranged from the usual game-tablets, and are in two different colors.

Claim.—The improved domino or tablet, the dots on each half of the face of the said tablet being marked in two different colors, substantially as herein described.

143,704.—Hinge.—HENRY MANNECK, New York, N. Y. Application filed February 18, 1873.

The hinge, with the eyes for the pintle, is made of a double thickness of sheet metal, the outer thickness extending beyond the inner at its edge, and bent under it to strengthen it. Tongues are cut and so bent out from the leaf that they can be passed through a pasteboard box and clinched upon the inner side to secure the hinge. By this construction rivets and screws are done away with.

Claim.—1. A sheet-metal hinge, each leaf of which consists of two thicknesses of metal, one of which is extended and folded over the edge of the other, and which, with its tubular portions, is formed from a single strip.

2. A hinge formed of sheet-metal, upon the leaves of which are cut tongues to fasten the hinge to the material to which it is applied, substantially as described.

143,705.—Piston-Packing.—THOMAS J. MAYALL, Boston, Mass. Application filed June 17, 1873.

Packing for piston-rods, &c., is made of canvas or other fabric, which is treated first with bees-wax or other lubricant, and then with rubber solution. The prepared fabric is then divided into strips, the longer edges of which are parallel with the warp, and these strips are then wound upon a mandrel or form in successive separate and independent layers, breaking joint with one another.

Claim.—1. Packing for pistons, piston-rods, steam-joints, and other uses, made of canvas or other fabric, treated first with bees-wax or other lubricant, and then with rubber solution, substantially as and for the purposes herein described.

2. The mode described of putting up the prepared fabric, the same consisting in dividing said fabric into strips, the longer edges of which are parallel with the warp or weft threads, as the case may be, and winding said strips spirally upon a mandrel or form in successive separate and independent layers, breaking joint with one another, as herein shown and set forth.

143,706.—Hoisting Apparatus.—NATHANIEL S. MCFARLAND, Williamsburg, N. Y. Application filed September 2, 1873.

The car travels in a single hoistway, having a box formed on top to receive the loose chain which passes over a pulley to a stationary chain-box in midway of the frame, and also connected by ropes or chains which pass over pulleys D, and secured to a vertically-sliding frame carrying the independent counterpoise of weights relatively to the car. In lowering the car a sufficient quantity of the chain from the stationary box is payed out into the car-box by pulling on the rope K to overcome the counterpoise-weights. To elevate the car its operation is vice versa.

Claim.—1. The combination of an independent counterpoise of invariable weight, F, relatively to the car, with the stationary chain box or chamber J, the car B, the hoistway A, the chain G, and wheel I, the whole being arranged for operation substantially as described.

2. The counterpoise constructed of a sliding frame, E, and independent weights F, in combination with the car B, chain G, wheel I, and stationary chain-box J, essentially as described.

143,707.—Potato Cutter and Planter.—LEMUEL J. MEWBORN, Kinston, N. C. Application filed July 9, 1873.

The potatoes, according to size, are dropped into tubes on the rear of the machine, where vibrating slides or cutters divide them as desired, and they fall into receptacles from which they are taken and placed in side hoppers, where revolving pocket-wheels pick them up, and carrying them over drop them into a trough which runs down and acts as an opener of the ground. A brush insures the right amount in each pocket; the surplus, falling off into a side trough, runs back into the hopper.

Claim.—1. The upward flanges p' on the rear side of seed-pockets p, and above the periphery of dropping-disk, as and for the purpose specified.

2. The inclined side channel S, leading back to the front of hopper, combined with a brush, R, as and for the purpose described.

3. The tube E, plate K, cutter F, and fingers H, constructed and arranged to operate substantially in the manner described.

143,708.—Railway-Rail.—BENJAMIN MYERS, Chicago, Ill. Application filed August 1, 1873.

Claim.—1. A reversible railroad-rail having twelve rolling-surfaces on heads A, flanged somewhat like the T-shaped rail, the periphery of one head serving as an elevated rolling-surface for a wide-gage track, and the flange or lateral side b of the adjacent rail serving as a rolling-surface for a narrow-gage track, substantially as shown and described.

2. The rail formed out of tubular metal, pressed into the shape shown, and having a channel, p, centrally through it for receiving a cable, E, substantially as described.

3. In combination with a rail having four heads, the wooden bridges B B, having the angular convex surfaces d and flat bearing-faces e, adapted to fit a concave space, c, and side surfaces b between the rail-heads and cross-ties, substantially as and for the purpose set forth.

143,709.—Washing-Machine.—FRANCIS M. NIXON and ENOCH N. BABCOCK, Lena, Ill. Application filed August 13, 1873.

To a rocking beater are adjustable handles having slots at their lower ends, which slide on the shaft, and are held by washers and nuts.

Claim.—The combination of the handles G, slotted at their lower ends, washers A, and nuts i with the shaft D and rocking beater E, all substantially as and for the purposes herein set forth.

143,710.—Grinding-Mill.—ROBERT PATTERSON and SUTTON PATTERSON, Newcastle-upon-Tyne, England. Application filed July 14, 1873.

Devices for adjusting the upper or runner stone as it wears away.

Claim.—The driver S combined with the adjustable lining T of the stone $G^{\times}$, when said lining is slotted and secured substantially as specified.

143,711.—Stand-Pipe for Water-Works.—GALEN W. PEARSONS, Ogdensburg, N. Y. Application filed May 24, 1873.

An air-pipe furnished with valves at either end, and arranged in the top of the stand-pipe to obtain pressure. By closing the valve, either by hand or automatically, the pressure in the stand-pipe is increased.

Claim.—An air-pipe or pipes furnished with valves operated either automatically or by hand, in connection with the top of the stand-pipe, substantially as and for the purpose herein set forth.

143,712.—Saw-Sharpening Machine.—EBENEZER W. PHELPS, Elizabeth, N. J. Application filed January 13, 1873.

The frame which carries the grinding-wheel has a universal movement, and can be adjusted to any desired position. The attachments are clearly defined in the claims.

Claim.—1. The combination of the swinging frame R, connected to the main frame by the brackets a a, and the sliding frame C, carrying the emery-wheel D, whereby the swinging frame can be adjusted to either side, and rocked up and down, and the emery-wheel given a lateral movement simultaneously, all substantially as set forth.

2. The adjustable swinging table G, for holding the saws while being gummed and sharpened, substantially as herein set forth.

3. The adjustable saw holder or support H, constructed as described, in combination with the cone-seat I, held on the support by means of the hook h, and eccentric lever J, substantially as and for the purposes herein set forth.

4. The counter-shaft holder, consisting of the standard N, with plate p and rim x, and the revolving pulley-holder O, with plate p' and groove y, substantially as and for the purposes herein set forth.

143,713.—Harrow-Tooth.—WILLIAM H. PLATT, Dayton, Ohio. Application filed November 16, 1872.

The tooth is made from a plate of metal cut into a semicircular form, and at the top it is turned at right angles, and provided with bolt-holes for securing the same to the frame.

Claim.—The harrow-knife having a quadrant edge curved downward and rearward, connected with the sides of the knife-plate by isometrically-curved bevels, and having its perforated upper portion bent at right angles therewith, forming the attaching-flange C, as specified.

143,714.—Shovel-Handle.—CHARLES POMEROY and JOHN D. OWEN, Mattoon, Ill. Application filed August 27, 1873.

The handle B is strengthened by a brace, D, inserted in it and bolted to the straps C C.

Claim.—The brace D, constructed substantially as described, in combination with the shovel and handle and straps C C, as and for the purpose set forth.

143,715.—Wagon-Seat.—ISAAC POWERS, Litingsburg, Mich. Application filed July 2, 1873.

Claim.—In combination with the seat A, the two springs B B, each bent, as shown, to form two prongs and two hooks, s s, and connected to the seat-bottom at each end by the keepers and together by the boards C C, all substantially as set forth.

143,716.—Car-Coupling.—GEORGE W. PUTNAM, South Glen's Falls, N. Y. Application filed June 26, 1873.

The link is provided at one end with a spring to lessen the shock attendant upon the meeting of the draw-head, and at the other with a hook and spring-bar for automatic coupling.

Claim.—The bar A, having a loop and spring plate at one end and a hook, z, and bar B at the other, all combined and arranged as and for the purpose herein set forth.

143,717.—Map Exhibiter and Cabinet.—WILLIAM A. RICE and GEORGE RICE, Framingham, Mass. Application filed March 24, 1871.

The invention constructed as indicated in the claims furnishes means whereby a large number of maps can be safely stored within a small compass, and yet so accessible as to render it the work of a moment only to place any one required in a suitable and convenient position for exhibition.

Claim.—1. The sash E'', provided with the map-rollers M and pivots e'', and made horizontally and radially adjustable within a suitable frame, substantially as and for the purpose shown.

2. The drums I'' and K'', provided with the map-rollers M, substantially as shown, and for the purpose described.

3. The rollers E, consisting of the hollow-metal cylinder or tube x', filled with a ribbed, grooved, or corrugated wooden bar, E', substantially as and for the purpose shown.

4. In combination with the hollow rollers M or bar G, provided with radial longitudinal slots, a map, or its equivalent, having secured to or within its edge a wire or rod, s', substantially as shown, and for the purpose described.

5. The cabinet A, provided with doors B, hinged sloping lid C, brackets D, and arranged to receive map-rollers E, when the several parts are constructed and arranged as set forth.

6. The vertical map-holder I, K, and K', constructed as described, and provided with the vertically-adjustable sash L and M, substantially as shown, and for the purpose set forth.

7. The construction and relative arrangement of the various parts of the map-holder as a whole, substantially as and for the purposes set forth.

143,718.—Hand-Tool for the Manufacture of Heels.—SMITH L. RIKER, New York, N. Y. Application filed August 16, 1873.

Claim.—1. The improvement in forming heel-blanks with a hand-tool, by punching and retaining the lifts in the same holder, and uniting them in the manner substantially as described.

2. The punch having the nail-tube f, driver i, and swiveling driver-stock k, arranged to operate substantially as described.

143,719.—Heel-Plate for Boots and Shoes.—GEORGE ROSE, Williamsburg, N. Y. Application filed April 25, 1873.

A metal disk revolves in an annular plate, which is secured to the heel of a boot or shoe. The disk is reversible, having a smooth wearing-surface on one side and with studs on the other to form an ice-creeper.

Claim.—The disk C, provided with pins c, and combined with a ring, B, and a frame, A, substantially as set forth.

143,720.—Car-Coupling.—EDWARD R. SCOTT, Noblesville, Ind. Application filed June 24, 1872.

The link, entering, throws the catch up out of the way until the link has passed far enough into the draw-head for the catch to fall within it. Then the draft-strain is equally distributed between the interior and exterior of the roof of the draw-head.

Claim.—In combination with a bumper provided with a slot, g, in its upper side, the angular latch herein shown, having the curved slot f, bearing-points b d, inclined surface e, and point c, and held to the bumper by the cross-piece c, all substantially as and for the purposes herein set forth.

143,721.—Folding Chair.—DAVID N. SELLEG, Newburg, N. Y. Application filed October 3, 1873.

The seat is hinged to the extensions of the front legs, and connected by hooks with the extensions of the rear legs. The arms are in three pieces, the upper one of the two front pieces being hinged to the front extension, and the lower one to the rear piece, which is at the other end pivoted to the rear extension.

Claim.—The folding chair constructed with pivoted legs A B, hinges V, seat S, hooks L, pins J, and the hinged arms M N G, substantially as shown and described.

143,722.—Compound Metal-Working Machine.—HIRAM B. SEVEY, Vienna, Me. Application filed September 15, 1873.

Claim.—The arrangement and combination of the bed or frame a, provided with the spring e and the cogged frame w, the arm b, having the projection t and cogs c, the shears d d', the eccentric g, with its cogs f, the links i j, hand-lever A, with its cogs v, bending device l, and die k, as herein set forth, to operate as shears and metal-bender.

143,723.—Rotary Steam-Engine.—LEVI M. SHAW and ALLEN S. BAKER, Evansville, Wis. Application filed April 8, 1873.

A revolving spherical case, with a diaphragm, is made in two halves, one being rigidly held, and the other at an angle, loosely, in journals. The shaft is hollow, and the angular section thereof has a central spherical projection, against which adjustable bearing-blocks with packing in them, and made wedge-shaped, bear. The piston-heads, secured to the loose section of shaft, are flat on their outer and inclined on their inner sides, and bear against the wedge-shaped blocks in revolving. The steam is admitted and exhausted alternately through the hollow-shaft sections on opposite sides of the bearing-blocks, through suitable ports.

Claim.—1. The combination of the inclosing-case, the piston-heads set at an angle, the connecting-diaphragm, and central disk and hollow shafts F d forming the steam-passage, all the parts being adapted to revolve together, substantially as described.

2. The combination of the shaft F having the piston-heads attached thereto, as described, with the case c c having an opening upon one side, as shown, the position of the piston-heads relative to the case being changed by the revolution of the case, as described.

3. The combination of the central disk, the diaphragm, and the oscillating bearing-blocks K^1 K^1, as described.

4. The engine described, consisting of the base A, standards B B, case C, constructed as described, piston-heads, diaphragm, and shafts, the case and its interior parts being adapted to revolve together, substantially as described.

5. The combination of the spherical projection e upon the shaft F, with the packing-ring g and adjusting set-screws, as described.

143,724.—Portable Pump for Mines.—WILLIAM E. SIDNEY, Knightsville, Ind. Application filed August 20, 1873.

Each valve-box has a pair of valves opening in opposite directions, by which arrangement the suction-pipe may be used as the discharge-pipe, or vice versa.

Claim.—1. A force-pump located on a portable truck, and provided with double valves, whereby its operation may be reversed, substantially as and for the purpose specified.

2. The valves k k' opening in opposite directions, and separated by the chains m and screw-caps n, substantially as described.

143,725.—Steam and Vacuum Pump.—ALONZO J. SIMMONS, Indianapolis, Ind.—Case B. Application filed May 14, 1873.

The cold-water valve-chambers, arranged under the main cylinders, are provided with bent or elbow jet-pipes leading from the said chambers, at or near the bottom thereof, toward the main cylinders, and assist in condensing the steam therein. A pipe with stop-cock connects the two valve-chambers and forms a communication between them for the purpose of filling the space in the one cylinder from the other, not before filled by vacuum.

Claim.—1. In combination with the cylinders A A' and valve-chambers B B' of a steam-pump, the bent or elbow pipes D D' within the cold-water chambers B B', and leading respectively from the valve-chambers B' B, at or near the bottom, to the valves in the bottom of the cylinders A A', as and for the purposes herein set forth.

2. In combination with the valve-chambers of a steam-pump, the pipe G, with stop cock A, connecting the two valve-chambers, and forming a communication between them, substantially as and for the purposes herein set forth.

143,726.—Needle and Shuttle Threader and Knife.—JOHN SLACK, Brooklyn, N. Y. Application filed June 5, 1873.

The hook may be used to draw the thread through the eye of the needle or shuttle, and the blade serves as a knife.

Claim.—As a new article of manufacture, the thread-cutting and threading instrument, substantially as described.

143,727.—Animal-Trap.—BENJAMIN F. SMITH, Philadelphia, Pa. Application filed July 30, 1873.

A pair of nipper-levers, centrally hinged together, and each carrying a circle of curved barbed points, is held in engagement by a spring. It is set by a notched arm fitting against a lug on the spring-trigger, which latter holds the bait.

Claim.—1. The spring-jaws A and A', armed with hooks a, in combination with the spring tongue or trigger B and notched arm c.

2. The combination with the jaws A and A' and their barbed hooks with the arms d and d' and spring w.

3. The series of barbed hooks a, confined to the jaws in the manner described.

143,728.—Car-Coupling.—EDWIN D. SMITH, Sutton township, Brome county, assignor of one-half his right to LEONARD FORD, Dunham, Canada. Application filed June 26, 1873.

The coupling is automatic, and uncoupling is effected by means of a lever and a chain which passes over a pulley.

Claim.—1. The combination of the flap D, rod F, spring G, lever H, chain I, and pulley J, as shown and described, for the purpose specified.

2. The springs L L in the recess B of the draw-head, in combination with the coupling-link, as shown and described, for the purpose specified.

143,729.—Machine-Gun.—CORNELIUS STEENLAND, Negaunee, Mich. Application filed July 17, 1873.

Claim.—1. The intermittently-rotating cartridge-cylinder C, provided with an even number of opposite rows of loading-chambers c, which severally contain pistons c^1, connected in pairs by rods c^2, substantially as and for the purpose set forth.

2. The combination of the intermittently-rotating cartridge-cylinder C c, connected pairs of pistons c^1, magazine D, and ram-rods F, substantially as and for the purpose specified.

3. The intermittently-rotating cartridge-cylinder C, provided with diametrically-opposite rows of loading-chambers c, and an equal number of rows of needles, e, arranged at right angles to the loading-chambers, substantially as and for the purpose specified.

4. The combination of the intermittently-rotating cartridge-cylinder C c e, provided with ratchets C^2, sliding bolts G^1, hammers G G^2 g, links g^1, and springs I, substantially as and for the purpose specified.

143,730.—Forceps for Snouting Hogs.—GEORGE SIPPERSON, Zionsville, Ind. Application filed August 6, 1873.

Claim.—The forceps having the corrugated and slotted jaw D and the jaw D, recessed and provided with the spring-plate G, being forked, all constructed and arranged for operation as and for the purpose specified.

143,731.—Snow-Plow.—BENJAMIN B. SWEET, Wilmington, Del., and JOHN NOBLE, Philadelphia, Pa.—Application filed August 25, 1873.

Claim.—A snow-plow in which are combined a furnace, A, a partition, D, extending into the nose of the plow, and a return flue-boiler, G, or its equivalent, whereby the whole of the products of combustion from the said furnace are directed first into the nose of the plow, thence to the rear end of the latter, and finally to the front, before making their escape, all substantially as and for the purpose specified.

143,732.—Stirrup.—NELS C. THOMPSON, San Francisco, Cal.—Application filed March 13, 1872.

Claim.—The described stirrup, having the parts A B C and rollers D combined, as and for the purpose described.

143,733.—Machinery for Removing Dirt from Skins.—CHARLES TURNER, Lenton, England.—Application filed January 16, 1873.

The skin is stretched over a drum and presented to the action of a series of brushes arranged spirally upon a shaft, the drum and shaft revolving in opposite directions.

Claim.—1. The combination of the swinging brush-frames E E^1 E^2, having brushes F^2 F^4, as described, with the set-screws I, block H, and springs H', as described.

2. The combination of the hand-lever E^2 with the wedge-bar K, substantially as described, for the purpose set forth.

3. The brush frame or frames, each carrying a brush-axle, F, bosses F^1 F^3, and brushes F^2 F^4, tie-bar E^3, blocks H, set-screws I, pulleys M, the weighted truck-carrying arms M, cam-axle K, and cams K', hand-lever L, and cylinder C', all operating substantially as described, for the purposes set forth.

143,734.—Planing-Machine.—JOHN UTTER, Central Falls, R. I.—Application filed August 18, 1873.

A clamp with segmental jaws is fitted to the bed of a planing-machine to hold the material at any angle.

Claim.—A device constructed substantially as and for the purpose described.

143,735.—Machine for Forming Seamless Cans.—MATTHEW VON CULIN, Philadelphia, Pa., assignor, by mesne assignments, to EWALD RIEDEL and JOSEPHINE E. ROEBLING, same place.—Application filed March 17, 1873.

Claim.—1. The method herein described for forming seamless cans or other ware with vertical sides from sheet metal, by first forming a vessel with flaring sides, and then, by one operation of a plunger, forcing the same through a die of the construction described, and retaining the same bend in the blank, substantially as set forth.

2. The flaring-mouthed die A, having the vertical portion a b, and a shoulder or offset at the bottom, in combination with the blank-holder C and plunger D, constructed as described, and for the purpose specified.

143,736.—Belt-Shifting Apparatus.—OLIVER H. WADE, East Bridgewater, Mass.—Application filed April 9, 1873.

An adjustable belt-guard, together with a sliding rod having a motion on its axis, so that the guard may be as near as desired to the pulley in all directions, and, being adjustable, will force the belt in the desired direction, and also allow it to twist into position to go on the next pulley.

Claim.—1. The turning-rod D, in combination with the arm P and belt-guard K, operating substantially as described, and for the purpose set forth.

2. The combination of the rod D, the sliding rod E, arm F, and the guard K, operating substantially as described, and for the purpose set forth.

143,737.—Splint-Plane.—HENRY L. WEAGANT, Morrisburg, Canada.—Application filed August 29, 1873.

The slat is perfectly formed at each cut, beveled and straightened, and receives the proper bend to facilitate its being woven.

Claim.—The combination of the plane-iron B and beveling-knives D D' with the governor F, spring G, and recess H, as and for the purposes set forth.

143,738.—Washer-Cutter.—HENRY E. WHIPPLE, Providence, R. I.—Application filed August 9, 1873.

A clearing-plate is provided, which holds the stock down upon the cutting-bed when the knives are withdrawn.

Claim.—1. The combination of a cutter-holder and a spring-spindle with a clearing-plate, substantially as and for the purpose specified.

2. The adjustable gage-screws, in combination with the cutter-holder and the clearing-plate, substantially as and for the purpose specified.

143,739.—Chimney-Furnace.—LEWIS WHITE, Waterbury, Conn.—Application filed July 14, 1873.

Smoke in a chimney heats air in three distinct chambers, which are, by means of tubes, connected with each other.

Claim.—1. The combination of the chimney with an air-box, B, air-supply pipe, smoke-chamber d, and smoke-pipe e, all arranged to operate substantially as described.

2. The trap A and gate f, connected with each other for simultaneous operation, and combined with the air-box B and smoke-passages d d, and with the air-chamber E, substantially as and for the purpose herein shown and described.

3. The box E, containing the register G, arranged to work together with the box B, with which it is connected, as and for the purpose specified.

4. The combination of the air-chamber G, containing the smoke-passage n, with the register p, air-conduit C, and lower air-box B, with which the air-conduit also communicates, as set forth.

REISSUE PATENTS.

5,595.—Treadle for Sewing-Machines.—SAMUEL B. BUSHFIELD, Baltimore, Md., assignor, by mesne assignments, to himself, ROBERT D. MORRISON, JOHN H. WARNER, and WILLIAM L. STORK.—Patent No. 140,677, dated July 8, 1873. Application filed September 23, 1873.

The treadle is connected with a stationary shaft and with the pitman by means of rubber sections.

Claim.—1. The elastic piece C rigidly attached to the shaft forming the support and fulcrum for the treadle A, substantially as and for the purpose set forth.

2. The combination of a treadle with the pitman E, having an elastic section, D, at or near its point of articulation to the treadle, in the manner and for the purpose substantially as specified.

3. The combination of the treadle A, elastic piece C, shaft B, and pitman E having an elastic section, D, all constructed to operate in the manner and for the purpose substantially as specified.

5,596.—Composition of Matter.—GEORGE F. J. COLBURN, Newark, N. J., assignor to WILLIAM M. WELLING.—Patent No. 73,094, dated January 28, 1868. Application filed August 22, 1873.

Claim.—A composition of shellac and asbestus, in about the proportions and substantially as set forth.

5,597.—Oil-Can.—JOHN G. EVENDEN, Chicago, Ill.—Patent No. 115,943, dated June 13, 1871.—Division A. Application filed August 22, 1873.

Claim.—1. The combination of a sheet-metal can, C, with a series of longitudinal wooden strips, W W, arranged around it with their edges parallel, but not in contact, said strips being clasped firmly against the body of the can by means of hoops h h, and supported by the wooden base B, substantially as and for the purposes specified.

2. The supporting-hoop i, constructed with the large wire at its upper edge, as described, and applied to the can, in combination with the strips W W, which rest upon it and bear against the under side of the wire or rib formed by it, substantially as and for the purposes set forth.

5,598.—Can for Oils, &c.—JOHN G. EVENDEN, Chicago, Ill.—Patent No. 115,943, dated June 13, 1871.—Division B. Application filed August 22, 1873.

Claim.—The can A B, made with a pitch top, in combination with a wooden casing or covering applied to the sides and bottom only, such casing terminating at its top where the pitch of the can commences, substantially as specified.

5,599.—Sheet-Metal Can.—JOHN G. EVENDEN, Chicago, Ill.—Patent No. 115,943, dated June 13, 1871.—Division C. Application filed August 22, 1873.

Claim.—1. The combination, with a pitch-top can, A B, of the tube E, opening at its lower end into the can, and open at its upper end to receive a stopple, said tube lying flat against the surface of the oblique breast, substantially as specified.

2. The arrangement of the vent upon the breast of the can equidistant from the lugs which support the bail, and in line with the hand-hold, substantially in the manner and for the purpose specified.

5,600.—Pitman.—FRANK R. GLASCOCK, Hillsborough, Ohio.—Patent No. 133,581, dated December 3, 1872. Application filed August 23, 1873.

The inner sides of each bearing are correspondingly beveled so that as the upper section is forced down by the key the lower section is laterally displaced, bringing the bearing closely against the journal.

Claim.—1. The combination of an upper and a lower box, C, joining each other at parallel lines e, projected at an angle or bevel from points tangential with opposite points of the circumference of the bore, the upper box being adapted to move vertically, and the lower laterally, as set forth.

2. The journal-boxes C C, constructed as described, in combination with the strap and rod D D', key E, and nuts f f', substantially as and for the purpose herein specified.

3. The combination of the boxes C C, strap and rod D D', with key and nuts, as set forth, with the wrist-pin B, having the oil-cavity b and its cap, and the oil-passages h h', substantially as herein described, for the purposes specified.

5,601.—Cultivator.—CYRUS M. HALL and DAVID E. HALL, Uniontown, Ill.; said DAVID E. HALL assignor to said CYRUS M. HALL.—Patent No. 27,627, dated March 27, 1860. Application filed January 5, 1873.

The cultivator-beams are mounted upon a frame, supported upon two wheels, in such a manner that the beams have both a horizontal and vertical motion independently of each other.

Claim.—1. In combination with the barbed share A, the revolving cutting-wheel or shield C, the periphery and arms of which have sharp cutting-edges, constructed and arranged substantially as shown and described, for the purpose set forth.

2. The combination of the hitch-bolt K, the bars m and n, the bolt s, and the axle-tree Y, and a suitable device for holding and operating the same as co-acting devices for rendering the point ends of the beams adjustable, both laterally and vertically independent of the motion of their rear ends and independent of each other, and for equalizing the draft of the machine, each constructed and all arranged substantially in the manner described and set forth.

3. The combination of the sliding bar x, provided with supports upon the rear face of the axle-tree Y and the pendent posts I I, as a device for communicating lateral motion to the ends of the plow-beams, and of allowing and guiding vertical motion thereof, independent of any motion of the front ends of the same, constructed and arranged substantially in the manner and for the purpose set forth.

4. The combination of the front sliding bar x, the front cross-piece F', the bars m and n, hitch-bolt K, bolt c, the levers a a mounted and pivoted to the front ends of the beams, as shown by the link l, as co-acting devices for moving the front ends of the beams laterally, and of giving them vertical motion, either together or independently of each other, and independently of the motion of the aft ends of the beams, each constructed and all arranged substantially in the manner and for the purpose described and set forth.

5,602.—Malt-Drier.—WILLIAM W. HUGHES, Philadelphia, Pa.—Patent No. 94,114, dated August 24, 1869. Application filed July 19, 1873.

Drying-chambers are arranged on a level with malting-floors. Each chamber is connected by a flue, with a corresponding fire-place below. Dampers are so arranged at the lower ends of the flues that the heated air from each fire-place may be admitted to its flue, or excluded therefrom and admitted to the adjacent flue. Slatted valves in the rear of the fire direct the draft of air more or less directly upon it, as desired.

Claim.—1. The combination, in a malt-house, of the floors of the drying-chambers, arranged on a level, or thereabout, with the adjacent growing or malting floors, the inclined partitions t, and apertures for the admission and escape of hot air from the drying-chambers, substantially as and for the purpose hereinbefore set forth.

2. The combination and arrangement of the fire-places e e^1 e^2, &c., flues p p, &c., and dampers r, that the heat from one or any number of the fire-places may be directed in the manner and for the purpose set forth.

3. The slatted valves s, arranged at the back of each fire-place, for the purpose of regulating the supply and direction of cold air into the same, substantially in the manner described.

5,603.—Bedstead-Fastening.—THOMAS W. MOORE, New York, N. Y., assignor to F. N. MOORE.—Patent No. 127,786, dated June 11, 1872. Application filed June 28, 1873.

A plate, a portion of which lies flush in a circular recess of the rail, this portion having a hub which fits into a deeper but smaller concentric recess. The remaining part of the plate projects, in the same plane, beyond the rail, and has on its back, perpendicular thereto, a diagonal flange, to be passed into a corresponding plate lying in a mortise of the post.

Claim.—1. The plate A, having the edges a and the hub C made on arcs of concentric circles, as and for the purpose described.

2. The plate A, provided with the projection F and flange H, having the form shown, and for the purpose specified.

5,604.—Bed-Bottom.—SAMUEL PEARSON, Cincinnati, Ohio, assignor to EMANUEL G. GORY.—Patent No. 49 434, dated August 15, 1865. Application filed September 3, 1873.

Along the head and foot pieces of the frame is a series of wire springs, each bent to a loop extending inward and upward, and hooking onto a pin which hangs loose through the slat, to render the latter reversible on the loop, between the sides of which it lies, and into which it can descend unobstructed. The loop has at its bottom a coil on each side, its extremities affixing it to the frame.

Claim.—1. The combination of the pin c with the slat C, substantially as described.

2. The spring E, having double helices with spaces between them, through which a slat the full length of the bed may pass without obstruction, substantially as and for the purposes described.

3. A bed-bottom in which the slats are disconnected from each other, and sustained by springs E having the bent stirrups d to prevent lateral displacement of the slats, substantially as shown and described.

4. I combination, a reversible slat, C, spring E, adjustable pin c, substantially as and for the purposes described.

5,605.—Stove.—JOHN G. WIDMANN, Yonkers, N. Y.—Patent No. 23,970, dated May 10, 1859; extended seven years. Application filed July 16, 1873.

A fire-space surrounding the magazine and the oven above it allows the products of combustion to ascend to a chamber over the oven, which is thereby heated. A tubular opening through the side of the stove and oven, and an opening in the bottom of the oven into the magazine, allows fuel to be introduced. Flues extend from the upper part of the magazine, to conduct gas rising from the fuel down to the place of combustion just above the grate.

Claim.—1. An oven for cooking purposes placed over or above a fuel-magazine of a base-burning stove, substantially as described.

2. An oven, E, placed over or above the fire, in combination with a base-burning fuel-magazine, casing F, fire-space G, and door c, substantially as described.

3. The chamber G^1 above the oven E, in combination with a fire-space, G, leading from a fire-chamber of a base-burning fuel-magazine, substantially as described.

4. The oven-bottom in a base-burning magazine-stove partly exposed to the direct action of the fire, substantially as described.

5. The combination of the oven-door c, the opening o through the oven-bottom E', the removable cover c', and the base-burning fuel-magazine, substantially as described.

6. Tubes or conduits leading from near the top of the magazine D, and extending down to the incandescent coals near its base, for the purpose of conducting the gases from above the fuel in the magazine and delivering them to the incandescent coal, substantially as described.

5,606.—Harvester.—THOMAS N. FOSTER, South Pass, Ill., assignor to HENRY H. DOUBLEDAY.—Patent No. 30,215, dated October 2, 1860.—Division A. Application filed March 16, 1872.

The cutter-frame, which is hinged to the tongue-frame so as to have a vertical movement independent thereof, is connected with the whiffletrees by a jointed draft-rod.

Claim.—The combination of the tongue-frame, vibrating on the main axle, and having the tongue rigidly connected thereto, the independently-vibrating cutter-frame, and the flexible draft-connection between said cutter-frame and the whiffletrees, substantially as described.

5,607.—Harvester.—THOMAS N. FOSTER, South Pass, Ill., assignor to HENRY H. DOUBLEDAY.—Patent No. 30,215, dated October 2, 1860.—Division B. Application filed March 16, 1872.

Guide-pulleys for the reel belt are arranged near the foot of the reel-post, which is supported on the hinged platform.

Claim.—The reel, adapted to follow the movements of the hinged cutting apparatus and grain-platform, in combination with guide-pulleys, arranged at or near the foot of the reel-post, for retaining the reel-band in proper working relation to the driving and reel pulleys, as described.

5,608.—Stationary Fire-Pipe for Buildings.—HENRY PALMIERI, New York, N. Y., assignor of one-half interest to GORDON MONGAM.—Patent No. 136,537, dated March 4, 1873. Application filed September 1, 1873.

The horizontal branch pipes project from the vertical pipe in a curved line to facilitate the passage of the water into them from the vertical pipe, and their ends are closed by screw-caps to make them air and water tight, and to protect the screw-thread of the base-connection.

Claim.—The combination, with a vertical conducting water-pipe, arranged upon the outside or inside of the wall, as described, of the series of curved connections or branch pipes, at different altitudes, provided with sealing-caps, substantially in the manner and for the purposes hereinbefore set forth.

5,609.—Side-Saddle Tree.—JACOB STRAUS, St. Louis, Mo.—Patent No. 103,101, dated May 17, 1870. Application filed October 4, 1873.

Securing elastic yielding connections between the saddle-tree bars and seat by metal straps, provided with lugs and semicylindrical grooves to receive the elastic connections. Also forming the pommel-lip of a spring-metal top and leather bottom.

Claim.—1. In combination with the tree-bars A and A, connected together by means of the strap B, and with the seat D, provided with the plate E, the links F and F', hinged together and to said strap and plate, substantially as and for the purpose specified.

2. In combination with the tree-bars A and A, seat D, and links F and F', the rubber springs G, arranged to operate in the manner and for the purpose substantially as shown.

3. In combination with the tree-bars A and A, the strap B, provided with the pivotal lugs b, and the straps C, provided with the semicylindrical grooves c, substantially as and for the purpose set forth.

4. The pommel-lip D", composed of the leather body d and spring or sheet metal covering d', substantially as and for the purpose shown and described.

5. As a new article of manufacture, a side-saddle having its several parts constructed and combined to operate substantially as and for the purpose specified.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant thereafter, unless he shall make a new application within two years from the date of notice of the original allowance.

INDEX OF INVENTIONS PATENTED OCTOBER 14, 1873.

	Class No.	Whole No.
Air compressing apparatus, R. S. Parlee	12	143,634
Alarm and circuit therefor, electrical and thermostatic fire, J. H. Guest	50	143,691
Annunciator, electric vote, T. B. Doolittle	50	143 679
Baking powder, bread, Kopping and Weideman	35	143,580
Barrel head, A. Harvey	40	143,571
Baton, policeman's, Beery and McDonald	24	143,610
Bed bottom, S. Pearson, (reissue)	62	5,604
Bedstead fastening, T. W. Moore, (reissue)	62	5,603
Bee hive, J. H. Shook	9	143 643
Belt clamp, E. Ainsworth	81	143,604
Belt shifting apparatus, O. H. Wade	87	143,736
Boiler, culinary, J. H. Corey	154	143,673
Boilers, dead light for steam, J. C. Headley	149	143,574
Bolt and rod cutter, L. H. Smith	14	143,645
Boot and shoe channeling machine, C. S. Dunbrack	16	143,561
Boot and shoe edge protecting welt, J. Green	16	143,623
Boot and shoe heel plate, G. Rohr	16	143,719
Boot and shoe nailing, driver for, A. S. Libby	16	143,699
Boot and shoe sole edges, machine for finishing, Fairfield and Messer, Jr	16	143,682
Boots, manufacture of, W. H. Ferguson	16	143,687
Boots, &c., heel for, Gebhard and Schwars	16	143,688
Bottle corking machine, J. Armstrong	1	143,606
Bottle, cosmetic, M. H. Huntington	161	143,627
Brick machine, D. W. Glendinning	90	143 569
Brush, rotary, G. Carlisle	22	143,666
Brush, scrubbing, C. Herold	22	143,695
Bung, H. K. Haslett	40	143,573
Burner, oxyhydrocarbon gas, J. D. Averell	64	143,555
Caliper, W. H. Miner	97	143,584
Can, oil, J. G. Evenden, (reissue)	136	5,597
Can, oil, W. A. Foster	136	143,567
Can for oils, &c., J. G. Evenden, (reissue)	136	5,598
Can, sheet metal, J. G. Evenden, (reissue)	136	5,599
Cans, machine for forming seamless, M. Von Culin	136	143,735
Cans with tomatoes, &c., apparatus for filling, C. S. Bucklin	58	143,613
Candy cutter, F. Quinn	155	143,590
Car axle box, L. Schulze	132	143,592
Car coupling, G. Edmonds	122	143,680
Car coupling, J. H. Payne	122	143,636
Car coupling, W. D. Pope	122	143,638
Car coupling, G. W. Putnam	122	143,716
Car coupling, E. R. Scott	122	143,720
Car coupling, J. Sotolove	122	143,593
Car coupling, R. D. Smith	122	143,728
Car coupling, O. Taylor	122	143,646
Car wheel, A. F. Cooper	122	143,560
Carriage, child's, L. Havasy	31	143,624
Carriage, child's, J. G. Kamphaus	31	143,698
Carriage shaft holding attachment, A. C. Maxfield	31	143,582
Carriage spring, G. Hopson	31	143,576
Carriage top joint, J. H. Combs	31	143,669
Chair, folding, D. N. Selleg	92	143,721
Churn, J. L. and T. R. Britt	45	143,612
Churn dasher, I. B. Compton	45	143,559
Clock calendar, A. Frankfeld	38	143,618
Cock, J. W. Faxon	107	143,683
Copy holder, W. R. Carter	117	143,616
Corn husker, G. W. Carr	75	143,667
Cracker machine, J. Fox	6	143,686
Cracker machine, G. J. Kingsbury	6	143,579
Cultivator, C. M. and D. E. Hall, (reissue)	43	5 601
Cultivator, wheel, Matchet and Smith	43	143,631
Cutter head, H. Fletcher	173	143,565
Cutter and planter, potato, L. J. Mewborn	133	143,707
Dice box, J. Twamley	148	143,599
Distilling pure alcoholic spirits, C. Andersen	47	143,654
Domino, B. Louineau	143	143,703
Door hanger, S. L. Bignall	24	143,557
Electric apparatus for signaling between railway trains, R. K. Boyle	50	143,663
Electric railway signal, S. C. Hendrickson	50	143,694
Engine governor, steam, C. R. Rungvist	69	143,642
Engine, rotary steam, Shaw and Baker	150	143,723
Equalizer, draft, W. W. Hinman	73	143,696
Fare box, T. L. Johnson	42	143,696
Fence, picket, R. H. McGinty	52	143,632
Fire arm, revolving, Forehand and Wadsworth	123	143,586
Fire escape, C. Dietrich	79	143,677
Fire extinguisher, portable, I. C. Andrews	35	143,605
Forceps for mooting bags, G. Stephenson	44	143,730
Fumigator for hospital and other uses, T. J. Mayall	106	143,583
Furnace, chimney, L. White	154	143,739
Gage, cloth marking, E. R. Emery	38	143,681
Gage, registering steam, P. Maltby	148	143,630
Gas retort, D. Davison	66	143,675
Glassware, mold for, G. H. Lomax	68	143,629
Globe holder, C. H. Barney	64	143,656
Gun, breech loading and magazine, B. and W. G. Burton	18	143,614
Gun, machine, C. Staneland	105	143,729
Harness attachment for hitching and unhitching horses, T. J. Dobbs	72	143,678
Harrow teeth, W. H. Platt	73	143,713
Harvester, T. E. Foster, (Div. A.) (reissue)	74	5,606
Harvester, T. E. Foster, (Div. B.) (reissue)	74	5,607
Harvesting machine, Baylies, Brown, and Lomont	74	143,609
Heel burnishing machine, C. W. Glidden	16	143,690
Heels, hand tool for the manufacture of, S. L. Riker	16	143,718
Hinge, H. Maunock	94	143,704
Hoisting apparatus, N. S. McFarland	79	143,706
Hose, hydraulic, L. R. Blake	81	143,661
Indicator and safety valve combined, J. Smith	152	143,644
Iron and steel, manufacture of, E. Peckham	85	143,637
Iron from blast furnace slag, manufacture of, J. J. Vinton	85	143,600
Latch for doors, locking, E. Halsey	93	143,692
Liquids, cooling coil for, W. Gee	58	143,683
Lubricator, J. McL. Power	87	143,639
Mail pouch holder and catcher for railroads, B. F. Bean	121	143,657
Malt drier, W. W. Hughes, (reissue)	19	5,602
Map exhibitor and cabinet, W. A. and G. Rice	146	143,717
Matter, composition of, G. T. J. Colburn, (reissue)	35	5,596
Measure, tailor's, J. Beandry	38	143,556
Metal working machine, compound, H. B. Sevey	109	143,722
Mill, grinding, R. and S. Patterson	57	143,710
Mop holder, E. M. Naramore	91	143,633
Mortar mixer, Hoagland and Mickel	20	143,575
Needle and shuttle threader and knife, J. Slack	134	143,726
Nut device for feed screws, divided, F. A. Huntington	100	143,626
Ores, reducing, J. H. Boyd	99	143,662
Organs, pneumatic action for, T. Winans	106	143,602
Packing, piston, T. J. Mayall	87	143,705
Pan, amalgamating, I. S. Parke	3	143,635
Pan, evaporating, D. Watson	155	143,649
Paper bag machine, L. C. Crowell	109	143,674
Paper ruling machines, striker for, J. D. Connolly	109	143 672
Pavement, stone, T. D. Owens	110	143,587
Peat machine, Clayton and Howlett	61	143,617
Photographic cameo embossing press, E. B. Barker	54	143,608
Photographic printing frame, W. H. Jacoby	111	143,577
Piano action, F. L. Trayser	112	143,647
Pinchers, shoemaker's, T. B. Shelly	16	143,594
Pipe for buildings, stationary fire, H. Palmieri, (reissue)	167	5,608
Pipe for water works, stand, G. W. Pearsons	167	143,711
Pipes, machine for making curved earthen, R. Connable	20	143 670
Pipes, making curved earthenware, R. Connable	20	143,671
Pitman, F. R. Glascock, (reissue)	67	5,600
Pitman rod, S. N. Wate, Jr	67	143 648
Plane, splint, H. L. Weagant	173	143,737
Planing machine, J. Utter	173	143,734
Plow, W. Blackstone	114	143,680
Plow, L. C. Frost	114	143,620
Plow, snow, Sweet and Noble	122	143,731
Power, mechanism for transmitting, J. Rankin	67	143,640
Press, cotton and hay, D. Reynolds	7	143,641
Press, hay and cotton, J. Müller	7	143,588
Printing press feed gage, G. Wilcox	117	143,652
Pruning implement, A. P. Bettersworth	63	143,659
Pump for mines, portable, W. H. Sidney	118	143,724
Pump, steam and vacuum, A. J. Simmons	118	142,725
Railway rail, B. Myers	120	143,708
Railway signal, electric, S. C. Hendrickson	50	143,694
Railways, mail pouch holder and catcher for, B. F. Bean	121	143,657
Rake, J. O. Jones	141	143,578
Rake, horse hay, W. H. Hartley	77	143,572
Rake, revolving horse, M. K. Flory	77	143,684
Refrigerator, W. M. Baker	58	143 607
Refrigerator, J. Rohrer	58	143,591
Refrigerator and cooler, C. D. Hicks	58	143 625
Register and indicator, E. P. Wheeler	42	143,651
Rein holder, J. W. Clark	78	143,668
Roof, fire and water proof, J. Long	126	143 581
Roofing, composite, R. S. Jennings	126	143,697
Saddle tree, side, J. Straus, (reissue)	72	5,609
Sash holder, Anderson, Walden, and More	94	143,655
Saw, jig, M. E. Weller	30	143,650
Saw set, M. E. True	131	143,598
Saw sharpening machine, E. W. Phelps	131	143,712
Scales, bag holder weighing, A. H. Bell	133	143,658
Screw cutting machine, M. B. Flynn	14	143,685
Sewing machine corder, J. G. Powell	134	143,589
Sewing machine table, W. H. Boyer	134	143,611
Sewing machine treadle, S. B. Bushfield, (reissue)	67	5,595
Sheet metal bending machine, C. F. Braud	136	143,558
Shovel handle, Pomeroy and Owen	141	143,714
Ship's sails, stay for, C. Freeman	138	143,568
Shutter fastening, J. A. Morris	94	134,585
Skins, machinery for removing dirt from, C. Turner	92	143,733
Soap, surface coating to hard, W. V. Wallace	26	143,601
Spark arrester for locomotives, M. Brasolli	94	143,664
Spirits, distilling pure alcoholic, C. Andersen	47	143,654
Square, protractor, rule, bevel, plumb, and level, combined, C. J. Shoff	97	143,595
Stirrup, N. C. Thompson	72	143,732
Stone, compound for making artificial, W. E. Forelew	153	143,563
Stove, J. G. Widman, (reissue)	154	5,605
Stove, base burning, A. Hathaway	154	143,693
Sugar cane from decay, preserving the stubble of, W. Green	58	143,622
Tag fastener, J. M. Geodridge	146	143,621
Telegraph cable, hydrostatic and electric, T. Tommasi	50	143,597
Telegraph, printing, L. T. Lindsey	50	143,702
Telegraphs, circuit for printing, L. T. Lindsey	50	143,700
Telegraphs, regulator for printing, L. T. Lindsey	50	143,701
Thill coupling, J. C. Thompson	31	143,596
Thrashing machines, separator for, S. E. Perkins	150	143,589
Trap, animal, B. F. Smith	143	143,727
Uterine supporter, A. C. Byam	156	143,615
Waffle baker, S. S. Fitch	88	143 564
Wagon, dumping, Greer and Thomason	31	143,570
Wagon seat, I. Powers	31	143,715
Wash bench, A. G. Emery	91	143,562
Washer cutter, H. E. Whipple	92	143,736
Washing machine, Nixon and Babcock	91	143,709
Watch key, Allen and Hall	36	143,653
Watches, double stop movement for, A. Frankfeld	36	143,619
Water chemically and mechanically, system of purifying, G. Demailly	147	143,676
Water traps, device for forming, W. A. Butler	167	143,665
Wool, &c., apparatus for cleansing dyed, J. E. Ackroyd	28	143,603

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED OCTOBER 14, 1873.

Ackroyd, J. E., Apparatus for cleaning dyed wool, &c	143,603
Adams, P. J., assignee	143,648
Ainsworth, E., Belt clamp	143,604
Allen, F. E., and S. G. Hall, Watch key	143,653
Andersen, C., Distilling pure alcoholic spirits	143,654
Anderson, S. I., P. Walden, and E. P. More, Sash holder	143,655
Andrews, I. C., Portable fire extinguisher	143,605
Anthony, E. and H. T. & Co., assignees	143,606
Armstrong, J., Bottle corking machine	143,606
Averell, J. D., Oxyhydrocarbon burner	143,555
Babcock and Nixon	143,709
Bach, J., assignee	143,623
Baker and Shaw	143,723
Baker, W. M., Refrigerator	143,607
Barker, E. B., Photographic cameo-embossing press	143,608
Barney, C. H., Manufacture of globe holders	143,656
Baylies, E., J. O. Brown, and F. T. Lomont, Harvesting machine	143,609
Bean, B. F., Mail pouch holder and catcher for railroads	143 657
Beandry, J., Tailor's measure	143,556
Beery, S., and J. W. McDonald, Policeman's baton	143,610
Bell, A. H., Bag holder weighing scales	143,658
Bettersworth, A. P., Pruning implement	143,659
Bignall, S. L., Door hanger	143,557
Blackstone, W., Plow	143,660
Blake, L. R., Hydraulic hose	143,661
Boyd, J. H., Reducing ore	143,662
Boyer, W. H., Sewing machine table	143,611
Boyle, R. K., Electric apparatus for signaling between railway trains	143,663
Braud, C. F., Machine for bending sheet metal	143,558
Brasoli, M., Locomotive spark arrester	143,664
Britt, J. L. and T. R., Churn	143,612
Brooks, J. W., trustee, assignee	143,690
Brown, Lomont, and Baylies	143,609
Bucklin, C. S., Apparatus for filling cans with tomatoes, &c	143,613
Burton, B. and W. G., Breech loading and magazine gun	143,614
Bushfield, S. B., Sewing machine treadle, (reissue)	5,595
Butler, W. A., Forming water traps	143,665
Byam, A. C., Uterine supporter	143,615
Carlisle, G., Rotary brush	143,666
Carr, G. W., Corn husker	143,667
Carter, W. R., Copy holder	143,616
Clark, J. W., Rein holder	143,668
Clayton, H. and H., Jr., and F. Howlett, Peat machine	143,617
Colburn, G. F. J., Composition of matter, (reissue)	5,597
Combs, J. H., Carriage top joint	143,669
Compton, I. B., Churn dasher	143 559
Connable, R., Machine for making curved earthen pipes	143,670
Connable, R., Process of making curved earthenware pipes	143,671
Connolly, J. D., Striker for paper ruling machines	143,672
Cooper, A. F., Car wheel	143,560
Corey, J. H., Culinary boiler	143,673
Crowell, L. C., Paper bag machine	143,674
Davison, D., Gas retort	143,675
Demailly, G., System of purifying water chemically and mechanically	143,676
Dietrich, C., Fire escape	143,677
Dobbs, T. J., Harness attachment for hitching and unhitching horses	143,678
Doolittle, T. B., Electric vote annunciator	143,679
Doubleday, H. H., assignee, (reissue)	5,606, 5,607
Doyle, R., assignee	143,673
Dunbrack, C. S., Boot and shoe channeling machine	143,561
Edmonds, G., Car coupling	143,680
Emery, A. G., Wash bench	143,562
Emery, E. E., Gage for marking cloth for cutting	143,681
Evenden, J. G., Oil can, (reissue)	5,597
Evenden, J. G., Can for oils, &c., (reissue)	5,598
Evenden, J. G., Sheet metal can, (reissue)	5,599
Fairfield, H. P., and W. W. Messer, Jr., Machine for finishing boot and shoe sole edges	143,682
Faxon, J. W., Cock	143,683
Ferguson, W. H., Manufacture of boots	143,687
Forslew, W. E., Compound for making artificial stone	143,563
Fitch, S. S., Waffle baker	143,564
Fletcher, H., Cutter head	143,565
Flory, M. K., Revolving horse rake	143,684
Flynn, M. B., Screw cutting machine	143,685
Ford, L., assignee	143,738
Forehand, S., and H. C. Wadsworth, Revolving fire arm	143,586
Foster, T. N., Harvester, (reissue)	5,606
Foster, T. N., Harvester, (reissue)	5,607
Foster, W. A., Oil can	143,567
Fox, J., Cracker machine	143,686
Frankfeld, A., Clock calendar	143,618

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *five-sixths* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 300 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,060 pages per month: 9,600 pages of specifications, 3,120 pages of drawings—12,720 pages.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	408
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS, complete, about	3,500
ELECTRICITY, (in progress,) to July, 1871	888
TEXTILE, (in progress,) to July, 1871, about	4,200

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 17. TUESDAY, OCTOBER 21, 1873. PRICE { $5,00 per year—single. $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

INTERNATIONAL PATENT CONGRESS.

VIENNA.

[The following letter of the President of the Patent Congress of Vienna, and the address (from phonographic report) of the Honorable J. M. Thacher, Assistant Commissioner of the United States Patent Office, and United States representative at said congress, are of sufficient interest to require their publication here. The resolutions of the congress are to be found on page 209 of the current volume of the OFFICIAL GAZETTE.—EDITOR.]

[Copy.]

42 PRATERSTRASSE 11,
VIENNA, *am 6 August*, 1873.

To the Honorable J. M. THACHER, *the Assistant Commissioner of the Patent Office, Washington:*

SIR: I beg leave to inform you that the Patent Congress, over which I have the honour to preside, passed this day, unanimously, the following resolution, and I hope that you will kindly consent to the request expressed by that assembly.

I have the honour to be, sir, your obedient servant,

C. WILLIAM SIEMENS.

Read and resolved to be sent:

"It has been publicly announced that the American Government, in consequence of an official notification from the Imperial and Royal Government, appointed the Honorable J. M. THACHER, Assistant Commissioner of Patents of the United States, to represent them at this Congress, but that Mr. THACHER, on his arrival, finding that the Austrian and other Governments were not officially represented, had declined to take his seat.

"In view, however, of the great interest for this Congress in the views and practice prevailing in the United States as bearing upon the questions now before us, this Congress respectfully ask Mr. THACHER to favour them with a statement of his views upon this subject, and that half-past two o'clock, on Thursday, the 7th inst., be appointed by the Congress for this purpose."

ADDRESS OF HON. J. M. THACHER BEFORE THE INTERNATIONAL PATENT CONGRESS.

Mr. President and Gentlemen:

I wish to return my hearty thanks to you for the invitation so courteously extended to me to address you here, and to assure you that my interest in the debates of this congress is not in the least affected by the fact that owing to unfortunate circumstances I have not participated actively therein. I regret exceedingly that I find myself placed in a position such that I have felt it would be improper for me to take my seat as an active member of the congress; but my sympathies—my whole heart—has been with you, and I hope that the final conclusions and resolutions of this congress will be fraught with great and important interests to the entire civilized world.

Permit me, gentlemen, briefly to explain what I understand to be the foundation of patent protection for inventions. And first, I believe that patent protection is founded in justice to the individual. One of England's greatest jurists has said, in substance, that it is universally conceded that man has the right of property in whatever he bestows labor upon. This was spoken with reference to manual labor, but when this principle is applied to invention, by so much as the mental faculties are higher than the physical, by so much does the individual seem to me to have a stronger and more righteous claim to property in the product of those mental powers than in the product of the physical. So, then, I am prepared to make this my first proposition—and I think it may be sustained before the whole world—that the protection of inventions by some good patent system is founded in justice to man himself, by granting to him the right of property in the product of the highest faculties which God Almighty has given to him. I should be glad to elaborate this point; it is one full of interest to us, full of interest to the great mass of inventors throughout the world, but there is so much pressing upon me in the short time which I can constant

to detain you from your legitimate discussions that I can only briefly notice this point with others. I wish to say simply this, that comparing the completeness of possession which the inventor has of his inventions with that which one has of the product of his physical powers, there can be found no higher right to the complete control of anything coming into the possession of man than that which he has to this product of his intellect. He has made it himself. If he keeps it to himself it is entirely and solely in his possession. No man can take it away; no process of law can extort it from him. He has a stronger and more valid right to it, based on possession, than even to his landed estates. Now, gentlemen, if this be the case, if man has such complete control over his invention, I can see no obligation on his part to impart it to others, unless it be for his own interest. I can see no obligation on his part to disclose it to others, unless he is permitted to control and use it as he would other property.

But I believe that patent protection is founded not alone upon individual right of property, but that it is based, secondly, on expediency, or a proper regard for the public good; in other words, that it is not only the right of the individual inventor to receive some protection, some legal recognition of his right to property in his invention, but also that the public welfare is advanced, and demands that he should thus be recognized. It is unnecessary before this assembly of intelligent men, who have thought upon and discussed these subjects, to say one word in support of this proposition. That inventions are beneficial to the world is conceded by all, both those who sustain the policy of patent protection and those who oppose it. The progress of the industrial arts is desired by every people. Now then, if progress in the industrial arts is desirable, and if inventions are conducive to that end, any system by which inventions shall be stimulated, and thereby greater and more substantial progress shall be attained, is a great and lasting public benefit. But patent protection is desirable on grounds of public policy, not only on account of the general benefits that arise from inventions, but because in this way only can inventors be induced to fully disclose to the public the products of their inventive genius. Give a man no protection, give him no inducement to disclose his invention, and how does he seek to secure some remuneration for the important discovery he has made? The only way open to him is to maintain it a secret. So long as he can keep it concealed from all the world and work it in secret he has some hope of securing benefit therefrom, but the moment he discloses it he loses dominion over it, and it becomes the property of mankind. So that if the inventor has no protection whatever his only hope of securing some reward for a valuable discovery is to keep it concealed and work it in secret. I need not stop long to prove the undesirability of such a practice; it is almost universally conceded. First and greatest of all objections to such a course is the fact that the manufacture becomes in this way one of the most odious monopolies that can be established, for just so long as the invention can be kept secret and can be practiced in secret, and is a desirable product, just so long can the inventor or manufacturer demand from the public whatever price he thinks best. An article may be held up in price, the public may be compelled to pay any demand, and the possession of the secret handed down from generation to generation, one of the most odious monopolies that can be suggested; or what would be equally disastrous, lost to the world entirely by the death of the inventor. It is necessary then to the progress of the arts, to the substantial welfare of the public, that measures should be adopted which shall induce the inventor to make the fullest disclosure possible of the invention he has made. But we have not reached those millennial days when men shall be influenced by motives of philanthropy alone. Unfortunately it is the pocket that controls men more or less in every station and in every country, and it is only from hope of reward, only from hope of substantial reward, that inventors, as business men, can be induced to disclose their discoveries, and thereby give them to the world as a public benefit. I say then, for the purpose of making the invention a public benefaction by securing its disclosure fully and completely to the world, open to all those who may wish to manufacture under suitable laws, some protection must be afforded, either by patent laws or by some other means.

Passing from this second fundamental principle, which I cannot stop to elaborate, the next inquiry is, if protection is just, and is desirable on the ground of public policy, what is the best system for securing the rights of the inventor and promoting the public welfare? Well, the only means, except by patents, that has been suggested with any show of reason, or really with any support, is that of giving the inventor a certain gross sum as a reward for the disclosure of his invention. It seems to me that the moment this plan is presented to practical minds its defects must be apparent. In the first instance it is impossible to determine the value of an invention when it is first made. Why, the history of inventions in our country, and in all others, so far as I know, is to this effect—that some of the most important have been least valued when first disclosed. The facts are familiar to you, and I need not refer to instances. All through the history of inventions in the world we find instances of inventors struggling from year to year to introduce their inventions. Some of them have gone down to the grave impoverished by their exertions, by the expense of time and money which they incurred in their attempts to convince the public that they had produced something valuable, and it has been left for future generations to take up their inventions, introduce them, prove their great utility to the world at large, and receive the reward. I think, then, it is utterly impracticable to determine the value of an invention when it is first disclosed. Suppose it might be approximately determined, the inventor on the one hand might at times receive too large a reward, for not only does history show that inventions have been under-estimated at first, but what has appeared to be valuable and promised to be of great utility and benefit to the world has sometimes proved to be utterly useless. And, on the other hand, if the invention be under-estimated, and the inventor sees it coming into general use without adequate reward to himself, the injustice done him is great, and the stimulus to further effort is taken away. The impracticability of this means of rewarding the inventor for his time and expense, it seems to me, must be so patent to every practical mind that it needs no further comment, and I dismiss it with the remark that, so far as our country is concerned, I believe it would be utterly impracticable and impossible to establish such a system there.

The grant of letters patent for a limited term is the only other mode which has been adopted as the means of rewarding the inventor and benefiting the public. It appears to me to be the only just and practicable manner of securing these ends. The inventor being secured in the exclusive right to his invention has a fair opportunity to place it on the market the same as any other property, with the hope that the demand will be such as to afford remuneration for his time and expense, while to the public is secured the full disclosure of the invention and its introduction into use. It may seem to follow from what has already been said that the inventor's right must be indefeasible; but just here the public good comes forward and demands that a perpetual monopoly shall not be created, and, therefore, that the exclusive privilege shall exist only for a reasonable term of years.

But there are important considerations to be taken into account in establishing a system of protection by patents. What are some of the elements of a good patent system? I say, first, that patents should be granted only for new and useful inventions; for new inventions only, because no man has the right to enter the public domain and obtain an exclusive privilege for what is already public property; and for useful inventions only, because no man has the right to obtain an exclusive privilege for that which will not work a substantial benefit to the public at large. Now, it seems to me that these propositions are so self-evident that they hardly need elaboration. They must commend themselves to the common sense of mankind to such an extent that they hardly need argument in their support. Grant that the inventor has the right of property in his invention, and that right exclusive, and it necessarily follows as a corollary to this proposition that he cannot have an exclusive right to whatever already belongs to another or to the public. Grant, too, that he should have an exclusive right to his invention, but that he should have that exclusive right only because public policy demands that he should have protection for his property, and it necessarily follows as a corollary of that proposition, that he should not have an exclusive protection for that which is injurious to the public. I think, gentlemen, I may leave this point with the assurance that it is generally accepted by you, for I am happy to know that in the resolutions you have already adopted it is distinctly recognized and asserted.

I pass, then, to a second point, and say that patent protection should be granted only to the original and first inventor. This may seem to be included in and to follow necessarily from the first proposition, and yet a moment's reflection will show that it is not so included, for if the law of any country should permit the introducer of the invention of another to secure an exclusive right thereto, the first requirements—to wit, that patent protection should be granted for new and useful inventions only—would not be violated. I therefore maintain, as a second requirement, that patent protection should be given to the original inventor only. This appears to follow logically and conclusively from the first proposition suggested—to wit, that patent protection is founded in justice to the inventor in his natural right as an individual to the product of his mental faculties. If that is so, he alone has that right, and he alone, or his legal representatives, can have the right to exclusive patent protection. Therefore, if he disclaims that protection—if he says "I do not wish to obtain any exclusive privilege for this invention, but prefer to give it to the world," it belongs not to some introducer, who takes it from one country and carries it to another, but to the *public*. I know of no legal right, of no legal principle, by which the mere introducer of an invention from one country to another can justly obtain an exclusive right to such invention. The natural right belongs to the inventor only; and, if he neglects to secure it for any reason whatever, it reverts to the public, and should become a part of the public domain. In former times there may have been reason for encouraging the bringing of inventions from one country to another by favoring mere introducers. In the then imperfect means of communication commercial transactions were attended sometimes with great difficulties, and even great danger; and it can readily be seen that it would be just and politic for a government, in order to secure the advantages resulting from the transfer or communication of a foreign invention to its own inhabitants, to grant some exclusive privilege to the introducer thereof. But in these days, when means of communication have been so largely and so wonderfully improved, so that two continents can exchange ideas in the twinkling of an eye, and citizens are continually passing from one country to another, and mingling freely with each other, the reason for the extension of such privilege no longer exists; and I believe that no country has a just right longer to hold out any encouragement to the introducer of a foreign invention by granting to him any exclusive right therein. The moral effect of such a provision of law should not be forgotten. Perhaps we have seen more of it in America than you have here upon the Continent, owing to the greater number of our inventions, and the greater number of patents which we grant. While we give no exclusive privilege whatever to the introducer of a foreign invention, there are some countries which do extend this privilege, and there are men who make it a business to carry inventions from one country to another. Now, I know of nothing in connection with patents that has so decidedly an immoral influence upon general business habits as this practice. These persons, some of them our own citizens, and some of them citizens of other countries resident with us, watch the issue of patents from our office, and immediately upon such issue *steal* the valuable inventions—I cannot apply a milder term—and carry them to other countries as mere introducers, to the great injury of the rightful owners. One of our leading attorneys, a few days before I left Washington for this country, told me that but a week before a gentleman came into his office and suggested that, as he had a large practice before the Patent Office, and was taking out patents for inventors every week, he would like to arrange with him so that if anything came which was valuable it would be communicated so soon as patented, to be taken to those countries granting privileges to the introducer, and the profits divided. Can one conceive a more immoral practice? I appeal to you, gentlemen, as business men, can you imagine a

more vicious and demoralizing practice than this? I am happy to say that the attorney told me he instantly rose, opened the door, and suggested to that gentleman that he should find his way out of the office as soon as possible.

But I proceed to say, thirdly, that I believe the two requirements suggested can be complied with only by establishing a preliminary examination. I do not know but here I shall meet some objection. It seems to be a point upon which some of my friends disagree. But it appears to me so logically necessary that I can hardly conceive that a man, granting the two propositions that a patent should be granted only for a new and useful invention, and only to the original inventor, can fail to arrive at the conclusion that there must be a preliminary examination; otherwise, how are you to know that you are not infringing upon the public domain by granting the patent? How do you know whether you are granting it to the inventor or the introducer? You may establish a form of oath for the applicant, but we know that false oaths are sometimes readily taken, and a man who is willing to steal the invention of another will not hesitate long to swear that it is his own. It seems to me absolutely necessary that the granting of patents should be attended by a prior thorough searching investigation to determine whether the invention is new and useful, and whether the privilege is sought by the true and original inventor.

If an examination is necessary, by whom shall it be made? It can be made by the inventor, by his attorney, or by a corps of official experts appointed by the government for that purpose. Let us consider for a moment by which of the three ways it is probable the greatest measure of justice may be secured. I think it will be granted by every gentleman that the more disinterested the tribunal the more impartial will be its decision. If this be so, the inventor is not the man to make a preliminary examination, and determine whether his invention is new and useful, for if any of you gentlemen have had experience in patent offices, either in obtaining patents or in granting them, you will probably agree with me that inventors, as a class, very generally fail to see the difference between their own inventions and those of others. It is natural that it should be so—the father is always proud of his child. I think, then, you will concede that the inventor is not that disinterested party who should determine whether he has the right to a patent. Although his attorney is somewhat farther removed from an interest in the invention, still, as a matter of business, he must be more or less influenced by the wishes of his client; and in his discussions with that client over the result of his examination he must necessarily yield to some extent to the opinions of the latter. He is working for a fee, and that fee frequently depends very much upon the opinion that he gives. We all know how this comes about. It results from an unfortunate weakness of human nature; and, although we might wish it were different, we are compelled to take circumstances as they are. It seems to me, therefore, that this work should be done by some person more completely disinterested than either the inventor or his attorney. It follows, then, that there must be some body of experts, call them examiners or what you will—some official body of experts—to take this question into consideration, and determine between the public on the one hand and the inventor on the other. For we must remember that a patent is somewhat in the nature of a contract, by which in exchange for the full disclosure of the invention on the one hand, the public on the other agrees that the inventor shall have for a certain number of years a monopoly or exclusive right to its manufacture and use. To determine what is just and equitable between the inventor and the public, what better tribunal can there be than a corps of examiners appointed by the government, and entirely disinterested in the question at issue? Given such a corps of experts, with scientific attainments sufficient to enable them to determine intelligently questions relating to the working of a mechanical or chemical invention, and also such legal knowledge as shall enable them to properly construe description and claims, entirely disinterested in the result, and it does seem to me that we should have reason to expect them to hold the scales of justice evenly between public right on the one hand and individual right on the other, and that their decisions would in general be more satisfactory to all parties interested than those of any other body of men. I believe, then, not only that the grant of a patent should be preceded by a prior careful examination, but also that it should be made by disinterested persons appointed for that purpose by the government of the country in which the patent is issued.

This method will also be much cheaper for the patentee than when he seeks the services of a professional expert outside of officials. The cost of patents in the United States, as compared with that in England, bears me out in this assertion. The cost of making an examination in our country is a mere trifle of $15, (£3,) while in England I suppose it is from £10 to £50, or even £100, according to the reputation of the expert employed. Some members of this congress have had experience in different countries, and can state more accurately the relative cost in each. While the expense of an examination in America is less than in any other country, I believe I am safe in saying the work is performed equally as well, and with as reliable results.

With the provision for official preliminary examination there should be coupled a liberal system of appeals. An examiner may sometimes err in judgment, and the grant of a patent should never rest upon the decision of one man. Let there be provision for appeal, so that the decision of the first tribunal, if adverse, may be reviewed once or more, and the rights of all will be amply protected by a patent system as nearly perfect, in my opinion, as can be devised.

But I wish to add, in general terms, that whatever system may be adopted in any country, to be really beneficial, it must be liberally administered. A system of preliminary examinations, although judiciously organized, may be so conducted as to become one of the greatest hardships to which an inventor can be subjected. Prussia affords an illustration in point. Prussia has an examining system which might answer every purpose, but is so administered that it is a common saying among inventors in America that the examination in Prussia is for the purpose of refusing patents for all inventions. And in that country where it seems to me inventions should be fostered and cherished, and where we might expect the most remarkable results from the

scientific and technical knowledge of her people, we find, in fact, the fewest inventions made and patented; perhaps I ought not to say *made*, but certainly the fewest inventions patented. Her inventors seek other countries, where their rights are more generously accorded and their hope of reward has better foundation, while foreign patentees have been taught by the experience of others to shun her patent office as a delusion and snare.

The full benefit of a patent system can be obtained only when liberally administered, and by this I mean to include not only liberality in the granting of patents, but also a liberal policy toward the inventor subsequent to such grant. Give the inventor all to which he is entitled, even though the invention should seem small, and then let the judiciary so construe the patent as to fully protect his rights and encourage his efforts. Such a course will be found in the end to be the best, not only for the patentee, but also for the public. The matter of judicial action in relation to patents may be outside the province of this congress, but I cannot forbear an allusion to it in passing, for it must necessarily have an important influence upon the success of a patent system in any country.

Permit me now to refer briefly to our patent system in America, for I suppose it will be interesting to you to know something of its workings, although I find less necessity for explanation on my part than I expected. Many of our German friends in this congress appear to have a full understanding of our system, a just appreciation of its beneficial influence, and I cannot commend it more strongly than they have already done. The history of patent protection in America is almost coincident with our existence as an independent nation. The first American Congress in 1790 enacted a law for the protection of inventions based upon the principles which I have already suggested. This law was amended from time to time as public interests seemed to demand. It was not until 1836, however, that our system as it now exists may be said to have been established. In December of that year the Patent Office, with all its records, was destroyed by fire. During the session of Congress that year the patent law was carefully revised, and a new law enacted which has not been materially modified by subsequent legislation. By the law of 1836 the Patent Office was completely organized, a corps of examiners established, and all the machinery of our system, as it now exists, put into operation. We may therefore be said to have taken a new departure in 1836, for up to that time the working of the office had been somewhat irregular, the preliminary examinations desultory in character, and the number of patents granted small in comparison with subsequent results. Since 1836 the development of inventive talent and the advancement of the industrial arts among us has been marvellous even to ourselves. The number of patents granted since 1836 is about 140,000. I happen to have in my hand a copy of our OFFICIAL GAZETTE for 1st July, 1873, and I find the number of the last patent of that date to be 140,567. The number of applications for patents has steadily increased from year to year, until it now averages from 20,000 to 21,000 per annum, and the number of patents granted annually is from 13,000 to 15,000. To perform the work of examining this large number of applications, the corps of expert examiners has been increased from time to time, until it now numbers about 100—to wit, 24 principal examiners, and the same number of first, second, and third assistant examiners, together with a special examiner of trade-marks and also of interferences. The clerical force has been correspondingly increased, so that the officials of all grades now employed in the office may be stated in round numbers as about 500.

The bare statement of the number of patents granted since 1836 is sufficient to bear me out in the statement that our system has proved to be a most remarkable stimulant to inventive genius, not only in our own country, but throughout the world. But you will very naturally inquire, how many of these patents are valuable? Of course it is impossible to obtain statistical information that shall be entirely reliable on this point, but my official experience has given me such data that I am enabled to form an opinion approximately correct. I have discussed the matter with others, and have sought information from manufacturers, patentees, and legal gentlemen who have made a specialty of the practice of patent law, and I think I do not exaggerate at all when I say that one-half of the patents granted in our country may be considered remunerative. Now I do not wish to be understood by this that one-half of these 140,000 patents have brought fortunes to the pockets of the patentees. They have become remunerative to a certain extent—that is, they have paid expenses and something more. A small proportion of them have become largely remunerative, and the patentees, or their representatives, have obtained large fortunes from them. I think, therefore, it may be said that the influence of our system upon inventions and inventors themselves has been beneficial beyond all expectation.

But you will also ask, what has been the influence of our patent system upon the manufacturing interests of our country? I have taken occasion to make some inquiries upon this point also. A short time before I left Washington the Secretary of State sent out to inventors, manufacturers, and others interested in patents, a series of inquiries, among which were some as to the influence of our patent system upon manufacturing interests of the country. With scarcely an exception, so many of our manufacturers as responded answered that the patent system was beneficial, beyond all manner of doubt, to the manufacturing interests of the country. It is estimated, both by myself and others who are qualified to judge of this matter, that at the present time from six to seven eighths of our enormous manufacturing capital is based upon patents, either directly or indirectly. In fact it is almost impossible to organize a company for manufacturing purposes in America without first securing the control of patents for some valuable invention.

I think, then, that we may be said to have reached this conclusion, that our inventors, patentees, and manufacturers have all been benefited greatly by our patent system. At the same time the public welfare has been greatly promoted by the general introduction of many valuable inventions, which otherwise would have remained undeveloped, and by the cheapening of many articles by the invention of new and improved modes of manufacture. At the same time we believe the whole world has been benefited by the liberality of our law. We make no distinction between foreign and native

applicants, but invite inventors from the whole world to give us the benefit of their inventive genius upon the same liberal terms that we grant to our own citizens, putting upon them no restriction as to time or place of manufacture, or introduction of the invention into public use.

But, gentlemen, while saying this, I do not wish to commend our system above others in all its details. We do not seek to engraft it upon that of other countries; indeed, it seems to me that it would be unadvisable for this congress to suggest for general adoption the patent law of any one country. But we should be glad if the deliberations of this congress should result in the acceptance of a few principles like our own, and the recommendation of those principles as the proper basis for patent legislation in the different countries here represented.

These principles I have already suggested. Should they be adopted and sent forth to the world with the indorsement of this congress, I believe important reforms may in time result therefrom. But the details of a patent system should be left to the different countries to work out for themselves.

Gentlemen, I congratulate you upon the assemblage of this congress, and trust that your deliberations may result in substantial benefit to the world. It may be some time before the reforms you seek are secured; but the agitation of these questions has here been inaugurated in such a manner that, if continued hereafter, success must eventually crown these efforts. To this end let me express the hope that you will not adjourn without establishing a permanent committee as the representative of this congress, so that an organization may be created by means of which the discussion of this subject may be continued from time to time until finally civilized governments shall become convinced of the righteousness and expediency of the principles here advanced, and there shall be universal recognition of the rights belonging to, and the public benefits conferred by, the inventors of the world.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,599.—Defecating and Clarifying Cane-Juice.—Granted to RICHARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 3, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,177.—Rubber Belting.—Granted to DENNIS C. GATELY, November 28, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,178.—Making Rubber Belting.—Granted to DENNIS C. GATELY, November 28, 1859. Application filed August 18, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,209.—Manufacture of Paper-Pulp.—Granted to JOHN B. PALMER and GARDINER HOWLAND, November 29, 1859; and reissued July 2, 1867. Application filed August 30, 1873. Testimony closes October 21, 1873. Hearing November 5, 1873.

26,243.—Water-Closet Basins.—Granted to WILLIAM BOCK, Sr., November 29, 1859. Application filed June 10, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,244.—Machines for Registering Music.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 29, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,262.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. FERRY, November 29, 1859. Application filed August 30, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,321.—Molding for Metal Casting.—Granted to JOHN P. BROADMEADOW, November 29, 1859. Application filed August 15, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,327.—Nursing-Bottles.—Granted to FRANCIS J. LA FORME, November 29, 1859, and reissued January 14, 1868. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,329.—Boot and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 22, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,339.—Water-Wheels.—Granted to JAMES F. COLLINS, December 6, 1859; reissued June 12, 1860, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,401.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 22, 1860. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,408.—Composition for Kindling Fire.—Granted to ELIZABETH BELLINGER, December 13, 1859, and reissued August 7, 1866. Application filed September 15, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,410.—Seed-Planters.—Granted to WILLIAM BLESSING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,454.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, Jr., December 13, 1859, and reissued April 3, 1860. Application filed September 13, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,475.—Breech-Loading Fire-Arms.—Granted to BETHEL BURTON, December 20, 1859, and reissued December 21, 1869. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 12, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,486.—Pipe-Molding.—Granted to JOHN FENTH and JOHN INGHAM, December 20, 1859, and reissued April 28, 1863. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,487.—Screw-Taps.—Granted to WILLIAM and ROBERT FOSTER, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Trap.—Granted to JAMES A. LOWE, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,513.—Nail-Plate Feeder.—Granted to JOHN NEWELL, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KENDALL, December 27, 1859. Application filed August 28, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,580.—Harvesters.—Granted to JOHN GOSS, December 27, 1859, and reissued January 15, 1861. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to JONATHAN P. GROSVENOR, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to SAMUEL LEEDS, December 27, 1859. Application filed September 29, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Porous Ware.—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, December 27, 1859. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to BENJAMIN F. STUNTEVANT, December 27, 1859. Application filed September 25, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,674.—Clothes-Driers.—Granted to B. B. HAWES, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to FRANCIS C. LOWTHROP, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,808.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 20, 1869. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,822.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,860.—Machines for the Manufacture of Tinware, granted to SAMUEL J. OLMSTED, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,908.—Stitches.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROBERT O. MELDRUM and AMOS B. PAXSON, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860, and reissued August 1, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,943.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,953.—Lamps, granted to GEORGE NEILSON, January 24, 1860. Application filed October 18, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOMINSKY, January 31, 1860, and reissued March 28, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,035.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOFT, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

30,467.—Apparatus for Singeing Pigs, granted to ABRAHAM and EDWARD M. DENNY, October 23, 1860. Patented in England February 9, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,263.—Fare-Boxes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

25,874.—Breaking-Machine, granted to GEORGE H. BABCOCK, October 25, 1859.

Claim.—1. In combination with mechanism for conveying the sheet, the use of rubbing-cylinder E and brush F, one or more of each, for the purposes and operating substantially in the manner herein described.

2. The use of one or more stationary rubbers, H, or their equivalents, for the purposes specified.

3. The wires *s s s s*, or their equivalents, for freeing the brush from the powder.

4. Constructing the griper in the manner described, whereby to obtain the advantages above set forth.

5. Inclosing the rubbing and brushing cylinders in a case for the purpose of retaining the powder and preventing waste.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date October 21, 1873.]

6,962.—Grape-Arbor.—CHARLES H. CRUMP, Boston, Mass., assignor to WILLIAM E. BAKER, same place. Application filed September 29, 1873. Term of patent 7 years.

6,963.—Clock-Pendulum.—HENRY J. DAVIES, Brooklyn, N. Y. Application filed June 16, 1873. Term of patent 3½ years.

6,964.—Breast-Pin, &c.—GEORGE W. LOOMIS and ALFRED T. GOODELL, New York, N. Y. Application filed September 25, 1873. Term of patent 3½ years.

6,965.—Cooking-Stove.—EDWARD MINGAY, Boston, Mass., assignor to BOSTON AND MAINE FOUNDRY COMPANY, same place. Application filed September 3, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date October 21, 1873.]

1,503.—Sauces.—ANGIOLO P. AGRESTA, and ANTONIO MEUCCI, New York, N. Y. Application filed July 9, 1873.

"a circle with rays; a human face within it, and with three legs in running position extending out from it in different directions, the letters 'A. M.' on the left hand, and the 'M.' being on the right hand, side of the sun."

1,504.—Razors.—HERMANN BOKER & Co., New York, N. Y. Application filed October 11, 1873.

"an elliptical figure, inclosed by an ornamental border of curved and other lines, with the words 'O. K.'"

1,505.—Rubber Goods.—MARY A. CATELY, New York, N. Y. Application filed June 10, 1873.

"A cut of a sea-shell with the letters L. P. R. G. in a monogram. The words 'La Perle Rubber Goods,' 'New York.'"

1,506.—Champagne.—W. CHILLINGWORTH & SON, London, England. Application filed August 21, 1873.

"'Carte Bleue' on a blue card or label."

1,507.—Umbrellas.—A. M. and R. DAVIES, New York, N. Y. Application filed September 15, 1873.

"a 'Sunburst,' and the number '142' in the central space."

1,508.—Preserved and Canned Food.—GORDON & DILWORTH, New York, N. Y. Application filed October 11, 1873.

"An oval figure inclosing an oval space traversed by a band nd bow, and surrounded by a fancy border."

1,509.—Oatmeal.—JOHN MCCANN, Beamond Mills, near Drogheda, Ireland. Application filed August 11, 1873.

"a sheaf of oats tied with a band, the words 'John McCann, Beamond Mills,' and a wreath of shamrocks."

1,510.—Snap-Hooks.—THE NEW YORK WIRE-SNAP COMPANY, New York, N. Y. Application filed October 2, 1873.

"A snap-hook with the words 'New York Wire-Snap Co.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date October 21, 1873.]

ORIGINAL PATENTS.

143,740.—Paper-Feeding Machine.—JOHN T. ASHLEY and FREDERICK ASHLEY, Brooklyn, N. Y. Application filed May 24, 1873.

The paper is placed in the tray A^1, which has previously had its side and back pieces adjusted to the size thereof. The tray and paper are then run into the part A of the frame upon bed A^2. The machine is then set in motion through the shaft S, when the picking-up fingers become exhausted of air by means of an exhausting-engine connected with the nozzles of the trunk B. This causes the fingers to pick up the topmost sheet of paper from the pile on the tray, and to hold it until carried, by a movement imparted to the trunk by the cam *a*, to the rollers E and dischargers *i*, which convey the sheet to the feed-board L. The dischargers *i*, being flexible and disk-shaped, tend to smooth the sheet as it passes under them. As the sheet moves on the feed-board the side-registering device *t* draws it over to the side guide L^1, and the front registering devices t^1 move it forward to be ready for the gripers of the cylinder S of the printing-press. While this operation is proceeding the elevating-screws *g g* are turned sufficiently, by the agency of the endless chain H^1, pawl and ratchet-wheel, and worm-gearing, to cause the table and paper to rise a distance equal to the thickness of a single sheet of paper.

Claim.—1. Picking-up fingers adjustably applied to and combined with a movable trunk, B, substantially as described.

2. Picking-up fingers C' C', arranged longitudinally with respect to the sides of the feeder for picking up the sides of the sheets, substantially as described.

3. The combination of one or more forward-projecting fingers, C C, for picking up the front edges of the sheets, with the longitudinal fingers C' C', for picking up the sides of the sheets, substantially as described.

4. The guides J' J' on longitudinally-moving trunk-carriers J J, combined with arms I and cams on the shaft *c* for vibrating these arms, and with springs s s^2, substantially as described.

5. The depressing-hooks n^1, eyes n^x, levers n^2, springs s^1, and cams *l*, combined with the vertically-movable trunk B, for depressing this trunk and its picking-up devices at the termination of the back strokes of the same, substantially as described.

6. The feed-board L, composed of laterally-adjustable sections *m*, substantially as described.

7. The adjustable feed-board side guides L^1, substantially as described.

8. The longitudinally-rotating and laterally-adjustable registering-fingers t^2 t^1, working over the adjustable guide-rests *w w*, leading from the feed-board to the impression-cylinder S, substantially as and for the purpose described.

9. The extended bracket-nuts g^1, attached to the sides of the adjusting table-bed A^2, which moves up and down within the part A of the frame, in combination with the elevating-screws *g g*, worms g^2, worm-wheels g^3, and a ratchet and pawl, all arranged outside of the frame of the machine, substantially as and for the purpose herein described.

10. The paper-tray A^1, having side and back pieces a a^1, which are adjustable, applied upon a table-bed, and made removable from said bed at pleasure, substantially as and for the purpose described.

11. Flexible pipes *d' d'*, combined with laterally-adjustable picking-up fingers on a trunk, B, substantially as described.

12. A circular flexible discharging device confined between concave clamps, for the purpose set forth.

13. The laterally-adjustable and laterally-rotating flexible finger *t*, combined with the side guide L^1 and feed-board, substantially as described.

143,741.—Tuck-Creaser for Sewing-Machines.—SYLVESTER P. BABCOCK, Adrian, Mich. Application filed May 17, 1873.

The material to be creased rests on the stud on the plate. The presser-plate is forced down against it by the presser-arm, and further movement of the arm turns the rocker-arm so that its forked or notched end pinches the fabric against the presser-plate.

Claim.—The movable pressure-bar C and plate $C C^1$, the latter carrying the stud *d*, the plate C^2, parts E E, presser-arm F, spring *e*, and tie-piece *f*, the creaser-bar H, creaser-plate I having the rock-shaft *h* journaled in its lugs *i i*, the rocker-arm J having a notch, *j*, in its shorter arm, and the spring *k* in connection with the base-plate A and gage-plate B, constructed and operating as and for the purpose set forth.

143,742.—Sewing-Machine Table.—JOSEPH BENNER, Philadelphia, Pa., assignor to NESBITT D. STOOPS and JOHN B. MYERS. Application filed August 27, 1873.

Arms are pivoted on each side of the table-top, which swing around and engage with lug-bearing plates which are attached to both ends of the cover, thereby supporting the cover as an extension.

Claim.—The combination of the swinging arms C C, brackets D D, and plates E E, with the table-top A and the ends of the cover B, substantially in the manner and for the purpose above described.

143,743.—Endless Band.—LEONHAM BINNS, Oakenshaw, near Bradford, England. Application filed August 25, 1873.

The core is obtained by winding sufficient material after the manner of skeining, and then properly securing the ends. Strands of suitable material are then either wound, woven, or braided around it to form a covering.

Claim.—Endless bands, cords, or ropes, made complete and entire by first forming the core of a suitable number of strands and then covering said core, substantially as described, with strands of fibrous material or wire wound around it.

143,744.—Spring for Wagons.—DAVID A. BOYLE, Attica, Ohio. Application filed June 18, 1873.

To avoid lateral and end play, the center of the seat being held rigidly in place by the roller-rod.

Claim.—In combination with the seat A, spiral springs G, and spring-board F, the rods D D, plates *d d*, roller-rod C, and brackets B B, all constructed as described, and for the purpose set forth.

143,745.—Coal-Breaker.—HEZEKIAH BRADFORD, Reading, Pa. Application filed April 8, 1873.

Claim.—1. The method of breaking coal by concussion in a revolving cylinder containing lifting shelves or blades and perforations for discharging the coal as broken, substantially as set forth.

2. A revolving cylinder of perforated staves, bound together by hoops, and connected to open heads, in combination with the lifting shelves or blades, the supply-chute, and the delivery-lifter *m*, substantially as set forth.

3. The screw-blade or sectional blades, in combination with the revolving perforated cylinder and lifting shelves or blades, substantially as set forth.

143,746.—Anti-Freezing Fire-Extinguisher.—WILLARD C. BRUSON, Chicago, Ill. Application filed January 30, 1873.

The generating-tank is surrounded by a larger tank, the space between them being filled with suitable non-conducting filling. The chargers containing the chemicals are placed one above the other in cases within the generating-tank, all the parts being insulated from each other by non-conducting material.

Claim.—1. In combination, the cases A L A F and tank E of a fire-extinguisher, with the interposed non-conducting packing, as set forth.

2. The combination and arrangement of the two chargers I and S within the same case E of a fire-extinguisher.

3. The chargers I and S, arranged one above the other, with a packing, J, of non-conducting material between them.

4. The case L A F, constructed with two parts to contain the two chargers I and S, and made detachable from the case A, as and for the purpose set forth.

143,747.—Wagon-Brake.—WILLIAM PERSLEY BUCKNER, Union county, Tenn. Application filed August 23, 1873.

Claim.—In combination with the sliding tongue B, provided with hole *e* and pin *d* for arresting its backward movement, and the crank-shaft D, connected with the rubber-bolster E by rods F, the connecting-rod C, jointed at one end directly to said tongue, and at the other end to said crank-shaft, as shown and set forth.

143,748.—Fastening for Coffins.—WARREN S. CRANE, Rome, Ga. Application filed September 10, 1873.

A curved slot in a swinging plate, which is secured on the lid, passes around the head of a screw which passes up through from the body of the coffin. A cap on the swinging plate covers the slot, thus forming a concealed fastening.

Claim.—The combination of the cap E and slot G, perforated plate F, and screw C as a coffin-fastening, substantially as described.

143,749.—Washing-Machine.—GEORGE G. CURTISS, Rochester, N. Y. Application filed March 17, 1873.

A washing-machine constructed in ordinary form, with its upper roller and bed, with an equalizing-spring of one piece of wire connected with the journal-boxes, and by a coil to the cross-bar, by which the rolls are held and allowed motion for passing through the clothes being washed.

Claim.—The automatically-acting equalizing-spring F, when composed of wire, and so made and applied as to be retained in position with relation to the roller B, cross-bar D, and follower-boxes *c*, without screws, bolts, or other similar appliances, in the manner and for the purposes set forth.

143,750.—Steam Fire-Engine.—WILLIAM C. DAVOL, Jr., Fall River, Mass. Application filed August 27, 1873.

A circular perforated pipe is placed around the bottom of the boiler; water flows through it onto the burning cinders on the ground.

Claim.—The combination of the conduit B and foraminous or perforated ring C with the fire-box of a steam fire-engine, all being substantially as set forth, and for the purpose of protecting its wheels, as specified.

143,751.—Pump.—JACOB EDSON, Boston, Mass. Application filed September 18, 1873.

The cover of the air-chamber has an inwardly-projecting flange, which prevents the escape of the air, and a projection which acts as a stop to a projection on the stuffing-box, preventing the latter from turning when the pump is in operation. Pipes leading to different parts of the ship are so arranged that a single pipe can be used to connect any one of them to the mouth-piece of the induction-port.

Claim.—1. In combination with the shaft *a*, the stuffing-box *f*, having a lug, *g*, and the stationary projection A on the cover *i*, as and for the purpose set forth.

2. The combination of the curved beam *e*, shaft *a*, and stuffing-box *f*, as and for the purpose set forth.

3. The cover *i*, provided with the projecting flange *l* and perforated bolt-sockets *m m m m*, as herein set forth and described.

4. The movable induction-tube *r*, in combination with the mouth-piece *p* and one or more pipes, *q q q q*, as and for the purpose described.

5. In combination with the mouth-piece *p*, flange *s*, and one or more pipes, *q q q q*, the hooked bolt *t* and nut *u*, or their equivalents, for the purpose herein shown and described.

143,752.—Car-Coupling.—FRANK A. FLEMING, Curwensville, Pa. Application filed March 12, 1873.

The bar C has hinged to it, by means of a shoulder-joint, the link D, which may rest on said bar when not in use, or be thrown forward to enter the approaching draw-head. The coupling-pin rests in a cavity in the bar C in such a manner that it can be driven back by the entering link, and thus couple automatically.

Claim.—1. The bar C, pivoted at its rear end to the draw-head, and carrying the link D at its front end, hinged thereto by the shoulder-joint *d*, substantially as shown and described.

2. The swinging coupling-pin E, with its rounded head *e* engaging with the crescent-shaped depression *c* and the inclined hole C^2 in the lower side of the bar C, substantially as shown and described.

143,753.—Sample-Bottle.—SAMUEL H. GILMAN, New Orleans, La. Application filed September 26, 1873.

A thin extension is formed upon one side of the bottle, with direct communication between this extension and the interior of the bottle proper. This allows the light to pass through a thin film of the liquid so that its quality may be the better determined.

Claim.—The new article of manufacture, a sample and testing bottle, constructed with a thin extension of its interior or chamber, said extension being in full communication with the main chamber of the bottle, substantially as and for the purpose described.

143,754.—Apparatus for Refining Sugar and Sirup.—SAMUEL H. GILMAN, New Orleans, La. Application filed September 26, 1873.

The object is to heat the saccharine solution to any given temperature before it reaches the bone-black or filtering medium.

Claim.—1. A filter or purifier composed of the cylinders A and B, the inner one being filled with bone-black or other purifying agent, and the outer one with water to be heated, substantially as set forth.

2. The inverted cone at the bottom of the vessel B, into which the solution to be filtered is first received before passing up through the bone-black or purifying agent, substantially as described.

3. The feed-pipe *j*, immersed in hot water, substantially as and for the purpose described.

4. The draw-off cock C, substantially as and for the purpose described.

5. The combination of the vessels A and B, hot-water chamber E, feed-pipe *j*, and steam heating or blow-up pipe G, substantially as and for the purpose set forth.

143,755.—Manufacture of Alkaline Carbonate.—HECTOR DE GROUSILLIERS, Berlin, German Empire. Application filed October 2, 1873.

Chloride of sodium or potassium, together with an alcoholic solution of carbonate of ammonia are introduced into a closed vessel lined with lead and heated by steam until a pressure of five atmospheres is obtained, whereby the alkaline carbonate is precipitated, the chloride of ammonium remaining in solution.

Claim.—The process for the production of alkaline carbonates from their haloid salts, by treating the latter with carbonate of ammonia dissolved in strong alcohol or wood spirit, substantially as hereinbefore described.

143,756.—Car-Coupling.—JOSEPH GUM, Marseilles, Ill., assignor of one-half his right to FREDERIC KANE, same place. Application filed January 7, 1873.

The distance of the plate C from the draw-head is regulated by the V-shaped bar D and loop E' of the strap *d*.

Claim.—1. The adjustable bent or Y-shaped device D, secured to the bumper-shank by means of the strap *d*, having loop E', in combination with the combined link and pin lifter, constructed substantially as herein shown and described.

2. The combined link and pin lifter, consisting of the plate C, having the arms *b* hinged to the bent rod D, the loop I pivoted to the arms *b* between the plate C and rod D, the transverse bar H having the handles K, the arm G' supporting the loop I, and the bent or Y-shaped adjustable device D secured to the bumper-shank by means of the loop E' of the strap *d*, all substantially as and for the purpose specified.

143,757.—Wrench for Bung-Bushings.—GEORGE W. HARRIS, New York, N. Y., assignor to GEORGE W. GILBERTS, same place. Application filed April 19, 1873.

A tapering plug, operated by a handle, is provided with spiral threads and a longitudinal furrow with an eccentric surface. A roller, arranged and pivoted lengthwise, is caused to move over this eccentric surface, which gradually forces the opposite side of the plug into the bush.

Claim.—1. The combination, with the tapering plug A having a longitudinal furrow, C, in one side, of the roller D, connected to the plug, and moving on the eccentric surface *a* in its furrow, substantially as and for the purpose specified.

2. A friction-wrench or key, of the character described, the tapering plug A of which is provided with spiral threads *a*, substantially as and for the purpose specified.

143,758.—Dumping-Platform for Railroad-Cars.—JOHN W. HARRISON, Niles, Mich. Application filed August 9, 1873.

To be used upon the running-gear of cars and wagons.

Claim.—1. The combination of the strip A', frame B B, C C C, friction-rollers *x x*, bulk-heads F F, and the shaft D, having pinion-wheels *d d*, all substantially as and for the purpose set forth.

2. The combination of the sliding floor K, clog-bars L L, gage-bars M M M, pivot-shaft N, and rollers *n n*, all substantially as and for the purpose set forth.

143,759.—Pump.—AARON L. HATFIELD, Clyde, Ohio. Application filed July 25, 1873.

The piston-rods are connected to the pitmen by links and jointed guides, the latter being hung on a bolt passing through the stock.

Claim.—The combination of pitmen F F, guides D B, links E E, rods C C, and guides *i i*, as and for the purpose specified.

143,760.—School-Desk.—CHARLES J. HIGGINS, Indianapolis, Ind. Application filed May 10, 1873.

The desk end is formed of one piece of wood, having the lower part slotted and bent so as to form a sufficient base, and having the central part solid.

Claim.—As a new article of manufacture, a bent wood desk end formed of one piece, having the lower part slotted and bent so as to form a sufficient base, and having the central part solid, substantially as specified.

143,761.—Steam-Trap.—JAMES W. HODGES, New York, assignor to himself and JOHN W. HARWAY, Bay Side, N. Y. Application filed February 21, 1873.

A tubular slide valve fits over a seat with suitable openings to allow the condense water to escape. Said valve is operated by a float attached thereto, and so balanced that it operates with equal freedom under any pressure. The case has several chambers, and the speed of the discharge-water is regulated by suitable screw plugs or valves.

Claim.—1. The openings 3 in the tube *i* above the tubular seat *o*, in combination with the tubular seat *o*, openings *h*, float *l*, and chamber *g*, substantially as set forth.

2. The arrangement of the partitions *e f* in the vessel *a*, to form the chambers *g h k*, in combination with the stop-plugs *v w*, and blow-off cock *x*, float *l*, and tubular valve *i*, substantially as set forth.

143,762.—Cooking-Range.—WILLIAM HOPKIN, Jr., Philadelphia, Pa. Application filed March 5, 1873.

A series of rising and diving hot-air flues, warmed by the side and back plates of the oven of the range, connect with the air-space partly surrounding the chimney, for purpose of supplying warm air to apartments above.

Claim.—The combined arrangement of the fresh-air flues E E and hot-air flue C, with an air-heating range, the said flues being constructed to operate together, substantially as and for the purpose hereinbefore set forth.

143,763.—Car-Axle Box.—WILLIAM B. HOWE, Troy, N. Y. Application filed August 1, 1873.

An oil-receptacle, with its inlet-tube, is cast solid with the box. Wick-tubes, having perforations in their lower end, are arranged to be inserted beneath the box. Metallic wicks are used, which are made of volute spiral spring combined with common flat cotton wick.

Claim.—1. In combination with a housing, D D, the oil-reservoir E, having its upper shell *a a'* made solid with the housing and box, and inclining from the lateral sides of the same downward toward their juncture, central with the housing, and directly beneath and parallel with the lower side of the axle to be lubricated, and an oil-receiving cup, G, communicating with the oil-chamber H, with its mouth on a plane with the lowest dip of the top shell, substantially as and for the purpose set forth.

2. A lubricator consisting of a wick-tube, J, with a closed bottom, *c*, and ports *p p*, and a wick, M, having an elastic support, and provided with a ball or screw-threaded base, for application to an oil-box from beneath, substantially as shown and described.

3. The combination of the extension-tube K with the wick-tube J, carrying an elastic supported wick, substantially as and for the purpose set forth.

4. The volute metallic-fabric wick M, composed of alternate coiled sheet metal *m* and fabric *n*, substantially as and for the purpose set forth.

5. The combination of a lubricator consisting of a wick-tube having a closed bottom and feeding-ports, and a wick having an elastic support, with an oil-box made with a housing, when said lubricator is applied from beneath, substantially as and for the purpose set forth.

143,764.—Gate-Hinge.—Wesley Hull, Fort Wayne, Ind. Application filed August 11, 1873.

Attaching to one plate or leaf of the hinge a horizontal frame, bent at right angles, so as to carry on its opposite sides two conical-shaped friction-rollers.

Claim.—The hinge-plate or leaf B, provided with the horizontal frame F or its equivalent, bent at right angles, and carrying on its opposite sides the two conical-shaped friction-rollers R R, in combination with the spiral or anger plate S and spiral tracks T T of the hinge-plate or leaf A, all constructed, arranged, and operating substantially in the manner and for the purpose set forth and described.

143,765.—Gasalier-Extension.—Liverus Hull, Charlestown, Mass. Application filed August 18, 1873.

The clamping device, for holding the central sliding portion of a gasalier at any required depression, is made adjustable.

Claim.—The adjustable friction apparatus, substantially as described, consisting of the lever F, one or two jaws, G G, the spring H, screw I, and nut K, all combined and arranged as set forth.

143,766.—Sewing-Machine.—George W. Hunter, Washington, D. C., assignor of part of his right to Wm. F. Stone, Henry M. Baker, and James H. Vermilye, same place. Application filed June 7, 1873.

The needle-bar is attached to one end of the cam-slotted piece that receives the crank-pin, and the cam is of such shape that as the needle penetrates the cloth the crank-pin is in a line with the needle-bar. A guide projecting from the slotted piece enters a groove in the head, and serves to steady the movement of the slotted piece and needle-bar.

Claim.—1. The combination of the cam upon the driving-shaft, the forked connecting-rod, provided with its spring and fixed fulcrum, and the feed-lever, provided with its adjustable fulcrum, substantially as and for the purpose set forth.

2. The combination of the straight driving-shaft A, the vibrating arm B^3, and the angularly-bored cylindrical sleeve L with its attached cam $B^{2\prime}$, for operating the shuttle and the connecting-rod of the feed mechanism, substantially as shown and described.

3. The combination of the needle-bar, the slotted cam, and cam-guide, when arranged substantially as shown and described, so that the needle-bar may be caused to move near that side of the needle-head which is next to the operator.

143,767.—Wheelbarrow.—Joseph M. Jones, Paris, and James L. Jones, Lexington, Ky. Application filed August 30, 1873.

Claim.—In a wheelbarrow, a sliding wheel to work in slots in the hangers, from a point forward of the bed to a point under its center, to be operated by crooked or inclined handles, substantially as above described.

143,768.—Filter for Oils, Acids, &c.—Josiah Jowitt, Brooklyn, N. Y. Application filed January 24, 1873.

Claim.—The vacuum-chamber V, steam-pipe S, and escape-cock E, in combination with the check-cock C and cock A, all arranged and operating substantially in the manner and for the purpose set forth.

143,769.—Pump.—Stephen Lane, Jr., Englewood, N. J. Application filed September 12, 1873.

The valves upon the pistons work independently of each other, from the outward ends of the pistons.

Claim.—In combination with the cylinder A, induction and eduction ports E and D D, and pistons B B', the valves *d* and *e*, arranged to work independently of each other from the outward side of the pistons, all constructed and operated substantially as described.

143,770.—Process of Lining Oil-Barrels with Glue.—Edward W. Leggett, New York, N. Y. Application filed September 22, 1873.

Prepares glue from any suitable glutinous substance, which is allowed to attain a certain liquid consistency, and is then applied directly to the inside of the cask, &c., when, after due evaporation, the cask is lined thoroughly, when a pressure of steam, generated by the heat applied, is sufficient to force the fluid into the pores and recesses of the wood.

Claim.—The within-described process of coating or lining the inside of barrels, casks, &c., with glue, wherein the glutinous material, instead of being produced by reduction from a previously solid state, is permitted to attain only a certain liquid consistency, and is then applied to the package and permitted to harden thereon for the first time, substantially as herein set forth and described.

143,771.—Sealing-Wax Package.—William J. Lumb, Zanesville, Ohio. Application filed October 3, 1873.

An ordinary box, of paper fabric, is filled with melted wax. While the wax is cooling it adheres firmly to the sides of the box.

Claim.—As an article of manufacture, the within-described sealing-wax package, composed of the box A, wax B, which has been poured in a melted state into the box, and permitted to harden therein and adhere to the sides thereof, and the cover C, substantially as described and shown.

143,772.—Collodion Compound.—John A. McClelland, Louisville, Ky. Application filed June 12, 1873.

A loose plate of zinc lines each wall of the mold; a strip of iron is placed on the bottom of the mold; upon the latter one or more pads of absorbent material; next, sufficient collodion to give a block of the desired size, coated upon the top and bottom with thin paper; and finally absorbent pads and metallic plate. Pressure is then applied, and may be continuous or intermittent.

Claim.—1. The process of drying said converted preparations by the alternate application of pressure and exposure to the atmosphere, to admit of the escape of the solvents.

2. Pads of felt-cloth or other absorbent material, employed to absorb the solvents of said converted preparations while the latter are under pressure.

3. Pads of felt-cloth or other absorbent material, employed to absorb the solvents of said converted preparations while the latter are under pressure in a closed vessel.

4. Paper or other equivalent material, employed to protect said converted preparations from contact with the pads or walls of the mold, substantially as and for the purpose specified.

143,773.—Lumber-Marker.—Washington Merritt, Weymouth, Mass. Application filed September 24, 1873.

Claim.—As a new or improved manufacture, the described timber-marker, consisting of the detachable gouge-blade C, and the separate handle B, and shank A provided with the blade-seat and shoulder, the studs, and clamp-screw, all constructed and arranged as set forth.

143,774.—Sewer-Inlet Trap.—George R. Moore, Philadelphia, Pa. Application filed September 25, 1873.

Within an outer case is placed a sediment-receiving box, B, held in place by corner guides and supports *b*. A screen and mouth-piece are placed above the receptacle, and a tight joint effected by mortar or cement.

Claim.—1. The improved sewer-inlet, consisting of an outside casing, A, a removable sediment-receptacle, B, and a removable flaring mouth-piece, C, extending at its inner edge low enough into the receptacle B to form a foul-air trap, and at the same time having its upper rim so fitted to A that a tight joint can easily be made with any kind of mortar or cement, all the parts being arranged substantially as shown.

2. The box B with rings *c c*, in combination with the guides *b b b b* and outside casing A, substantially as shown.

3. The flaring mouth-piece C, jointed to the casing A by the cement joints *a a*, substantially as shown.

143,775.—Horse Hay-Fork.—Aaron J. Nellis, Pittsburg, Pa. Application filed August 22, 1873.

The seat for the stop, which limits the slide between the sheath and the rod carrying the projecting and retracting barbs of a harpoon-fork, is formed to one side of the joint between the hinged jaws, so as not to be interfered with by the blows caused by discharging the elevated load.

Claim.—The solid or unjointed seat *g'*, formed by the hole *e'* in one of the jaws of the hay-elevator described, substantially as and for the purposes set forth.

143,776.—Wheel for Vehicles.—James O'Connor, Jackson, Mo. Application filed July 7, 1873.

Claim.—A wheel provided with spokes *b*, having their lower ends made in a conical concavo-convex form, with straight grooved sides, in combination with the hub A, constructed with an annular groove, *a*, in which the spokes are fitted, and the flanges *a a'*, having ribs *e*, which extend into the grooves *f* in the spokes, substantially as and for the purposes shown and described.

143,777.—Draft-Cock for Soda-Water and Other Liquids.—James D. O'Donnell, Washington, D. C. Application filed October 3, 1873.

In one position of the horizontally-working valve a small stream of fluid is allowed to pass through an orifice into a receiving-vessel. In another position a larger stream passes through another orifice against a ledge provided to obviate the splashing usually incident to the operation of such cocks.

Claim.—1. The combination of the tube B, the horizontally-working valve D, having two orifices, the one of which is enlarged at its outer end, with the valve-seat C provided with lug *k*, washer *w*, cylinder *a*, and nut F, substantially as and for the purpose specified.

2. The combination of the horizontally-working valve D, provided with two orifices, washer *w*, cylinder *a*, the tubular eccentric stem *g*, and the ledge E, substantially as and for the purpose specified.

3. The combination of the casing A, the tube B, the valve-seat C, lug *k*, the washer *w*, the valve D, provided with two orifices, one of which is enlarged at its outer end, and provided with stem *r*, with the hand *b*, the washer *x*, the tubular eccentric stem *g*, the ledge E, and nozzle G.

143,778.—Manufacture of Stemmed Glass-Ware.—John Oesterling, Wheeling, W. Va. Application filed September 9, 1873.

Portion of stem cast with bowl and portion with foot joint when united being in stem.

Claim.—A stemmed article of glass-ware in which the joint between the bowl and the foot is formed in the stem, substantially as described.

143,779.—Washing-Machine.—Noah J. Parsons, Cortland, N. Y. Application filed June 25, 1873.

To the sides of the machine, on the standards, are hung, by rods, segmental bars, and on these the journals of the rollers of the wash-bed are placed. The journals are held in their proper relative position by metallic plates so cut on the lower edges as to cap the journals.

Claim.—The combination of the movable segmental bars *c c*, plates D D, and rollers F F, substantially as and for the purpose set forth.

143,780.—Card and Ticket Printing Press.—George E. Peck, Du Quoin, Ill. Application filed April 21, 1873.

Bed reciprocates vertically to stationary platen. The inking-table I is attached to the bed, and moves up and down with it. The vertical movement of the bed causes lateral reciprocation of the inking-roller frame by means of compound lever L K. To give a dwelling impression an elastic washer, A, is placed between nut *g* and tumbling-box G. The card-holder is a frame, M, the sides *m* of which are adjustable. The cards are fed forward by a feeder, P.

Claim.—1. The moving bed C, crank F, pitman E, and elastic washer A, constructed and combined substantially as set forth.

2. The combination of a moving bed, C, with an adjustable ink-table, attached to and moving therewith, and the lever K, jointed at one end to a stationary part of the frame, and at the other linked to the ink-roller, with the connection-rod L jointed to said moving bed and lever K, as and for the purpose set forth.

3. The card-holder M, constructed with plates *m* made laterally adjustable, the pressure-board Q, and the compressing-spring R, substantially as set forth.

143,781.—Horseshoeing-Machine.—Charles H. Perkins, Providence, R. I., assignor to The Rhode Island Horseshoe Company, same place. Application filed September 5, 1873.

A clamp or presser fixed to a shaft carried by the sliding table, and having attached a lever carrying a friction-roll that rides up an inclined way. The heel of the shoe is clamped and held while the rollers operate on the toe, and is released after the operation is performed, and a drag, held down by a weight, slips over the toe, and, on the return of the table, removes it from the die.

Claim.—In a horseshoe machine, the combination of the sliding bed C, the presser-bar *c*, the lever-arm F, and track G for clamping a horseshoe-blank to the bed near the heels while the toe is being plated out, substantially as described.

143,782.—Horseshoe-Machine.—Charles H. Perkins, Providence, R. I., assignor to The Rhode Island Horseshoe Company, same place. Application filed September 5, 1873.

The bar, cut to the proper length, is placed between the spring-guides S S', and two swages, F F', advance and compress the metal near the ends, after which the former I advances and bends the metal by carrying it between the rollers N N', which are thrown forward to form the heel, by inclines, pressing outward the ends of two levers, to which the rollers are attached.

Claim.—The combination and arrangement of the swages F F', sliding pattern-block I, stationary blocks H H', and laterally-moving bending-rollers N N', substantially as described, whereby the operations of swaging the ends of a bar-blank for a horseshoe and bending the same can be consecutively performed, as set forth.

143,783.—Machine for Crimping and Folding Leather.—George Platts and Joseph Walden, Newark, N. J. Application filed May 3, 1873.

The folding-blade presses the folded edge of the leather into the groove between the ram and shoulder, and holds it until the ram is moved forward, pressing it firmly against the shoulder, establishing the form of the fold.

Claim.—1. The shoulder, the ram, the gage, and the folding-blade, combined, as shown and described, to perform the functions in folding and pressing the leather herein set forth.

2. The heating attachment, in combination with the shoulder and ram, substantially as described.

143,784.—Carpet-Fastener.—Bradley D. Kestad, Glen, N. Y. Application filed December 16, 1872.

The carpet-fastener is constructed to be attached to the base or mop board by hinges, and has upon its lower side pointed hooks, in a recess or rabbet, which, by turning down the hinged device, pass through the carpet, and is firmly held to the floor by screws.

Claim.—The combination of the recess B, hooks *c*, and hinges H with the edge-strip S and the screws T, whereby the said strip, when hinged directly to the base board, will be capable of turning the hooks toward the same and permit the edge of the carpet to enter the recess in the said strip, substantially as and for the purposes set forth.

143,785.—Spindle-Bolster.—George Richardson, Lowell, Mass. Application filed September 22, 1873.

Claim.—The bolster provided with the reservoir or trough *a*, one or more capillary inducts, *c*, one or more helical grooves, *b*, and the educt *d*, constructed substantially as specified.

143,786.—Jack for Nailing, &c., Boots and Shoes.—John G. Ross, Philadelphia, Pa., assignor of one-half his right to Thomas P. Smith and Samuel S. Smith, same place. Application filed November 25, 1872.

The last is constructed in two parts, both detachable, the toe-piece being made adjustable by means of a screw-rod. The last-standard is attached to a swivel-plate which is hinged to the top of a platform or table.

Claim.—1. A jack having detachable heel and toe pieces E and E', in combination with the plate D, provided with a regulating-rod, F, substantially in the manner and for the purpose set forth.

2. The inclines *k k* of the head *i* of the screw-rod F, in combination with the pins *l l*, for the outward movement of the toe-piece E', substantially as and for the purpose specified.

143,787.—Lawn-Mower.—William Sellers, Haverhill, Mass. Application filed September 24, 1873.

A circular cutter is mounted upon laterally-adjustable fingers attached to a common plate, the whole capable of vertical adjustment.

Claim.—1. The improved lawn-mower, as described, the same consisting essentially of the frame A A, driving-wheels B B, supporting and guide wheel C, the rotary cutter-carrier and its series of knives, and the turning finger-plate G, constructed, arranged, and combined together substantially in manner as shown and described.

2. In a lawn-mower provided with a turning finger-plate, as described, the combination, with the latter, of the guide and supporting wheel C, substantially as described.

143,788.—Chain Suspension-Bridge.—Edward W. Serrell and Edward W. Serrell, Jr., New York, N. Y. Application filed April 1, 1873.

The supporting-cable is formed of links placed side by side, and connected at the joints by a joint-bolt passing through all the links. In order that the cables may hang in inclined planes converging toward the bridge, as in wire suspension-bridges, and yet not suffer unequal strains, the saddle-blocks supporting the cable at the several points are made with inclined seats, normal to the suspension-rods and perpendicular to the plane in which the cable hangs, by which construction said suspension-rods draw on the joint-pins at right angles thereto, with a direct pressure on the saddle-blocks.

Claim.—1. A saddle connecting the two portions of a chain cable at the tower, made with eyebolts, arranged substantially as set forth, so that the chain between the towers may hang in a plane that is inclined to the vertical, substantially as set forth.

2. The saddle for the intermediate tower of the chain suspension-bridge, made with a convex surface inclined at a right angle to the plane of the cable, substantially as set forth.

3. The chain cables for bridges hanging in inclined planes, so as to be closer together at the bottom of the catenary that at the towers, and the joint-pins perpendicular to such inclined planes, substantially as set forth.

143,789.—Grand Piano.—George Sieck, New York, N. Y. Application filed July 31, 1873.

The frame has deep braces, the pull of the strings being arranged lengthwise, centrally of its width, and the sound-board attached directly to the frame allows the whole to rest upon lugs inside the shell or case of the instrument.

Claim.—The iron frame for grand pianos having the longitudinal braces A, B, C, D, and E, arranged in relation to the plane of the strings as set forth; in combination with the solid sounding-board H and wrest-plank J, substantially as herein described.

143,790.—Railway-Rail-Joint Fastening.—George A. Sturgis, Delhi, N. Y., assignor to himself and Dexter Pettehill, same place.—Case A. Application filed May 2, 1873.

Claim.—The combination of the plates B C, constructed as described, and rail A, screws *a a* and *d*, and nuts *a' a' d'*, and the single bent spring-key *g* holding the several nuts, all substantially as and for the purpose described.

143,791.—Car-Coupling.—Philip Swinerord, Middleburg, Pa. Application filed July 10, 1873.

The coupling-link has a beveled head, which, when it strikes in the narrow portion of one of the slots in the slide which works in grooves in the draw-head just behind the series of openings, wedges the slide up and passes into the wider portion of the slot, and the narrow portion catches behind the link-head. To uncouple, an angular lever is used, one arm of which rests beneath the bottom of the slide, and to the other arm chains are attached, one leading to the platform of the car and the other to the engineer.

Claim.—1. In a draw-head having a series of jaws, B B' B'', the vertical slide C, having a series of slotted openings, and the bent lever M, the whole adapted to the link G, and constructed and combined substantially as and for the purpose set forth.

2. In a draw-head having a series of jaws, B B' B'', the vertical slide C, bent lever M, chains P Q, the whole constructed and combined substantially as and for the purpose set forth.

143,792.—Pantaloons.—EDWARD T. TAYLOR, Philadelphia, Pa. Application filed June 19, 1873.

Pantaloons provided with short vents at the hip portions, having adjusting tabs and buckles.

Claim.—The combination of the side openings or vents O and O', tabs or straps T and T', adjusting-buckles B and B', and facing-strip F, all combined and arranged to operate substantially in the manner and for the purpose herein shown and described.

143,793.—Endless-Chain Propeller.—THEODORE TEED, Alexandria, Va., assignor of one-half his right to L. H. CHANDLER and C. P. CULVER, Washington, D. C. Application filed March 26, 1873.

The curved shape of the paddles prevents the lateral displacement of the water, and their incline with reference to the belt serves to buoy the boat and to facilitate their lift out of the water.

Claim.—The endless belt C, having the paddle *c c c c*, of the peculiar form and inclination shown and described, substantially as and for the purpose set forth.

143,794.—Automatic Fire-Extinguisher.—ISAAC P. TICE, New York, N. Y. Application filed January 28, 1873.

The reservoir swings on a bracket, and is held in an upright position by means of stops attached to the reservoir and to the wall, and a combustible line which passes over pins fastened to the walls to a point where it is secured. In case of fire, the line would be burned, when the reservoir would be reversed, causing the chemicals arranged therein to unite, and the gas evolved to be discharged through the alarm and escape pipe.

Claim.—The combination of a gas-generating apparatus, in which the gas-producing materials are caused to mingle by the reversal of the apparatus, with a combustible line communicating with all parts of the space to be protected, so that the burning of the line will permit the automatic reversal of the apparatus, and the consequent liberation of a fire-extinguishing gas, as shown and described.

143,795.—Heating-Drum.—ISAAC P. TICE, New York, N. Y. Application filed March 1, 1873.

Both the heated air and the products of combustion are carried into the chimney-flue and through the heating-drum.

Claim.—The furnace B, having the draft-pipe *k*, and the radiating-chamber *n n*, having the outlet and inlet pipes *l* and *m*, in combination with the flue E and radiators C, to produce the effect described.

143,796.—Wash-Boiler.—LEWIS W. TAUBENDELL and FRANK CURTIS, Owego, N. Y. Application filed June 19, 1873.

Claim.—The detached spouts B, in combination with the adjustable perforated false bottom C, formed in sections, and connected with wire springs, the extensions of which form legs, substantially as shown and described.

143,797.—Corn-Husker.—JOHN URE, Saginaw, Mich. Application filed September 10, 1873.

Upon the table which supports the husking mechanism is placed a sliding frame, for holding the stalks and bringing them within convenient reach of the operator.

Claim.—1. The arrangement of the table A with seat B and the slides C, having standards D D, for the purposes herein set forth.

2. The combination of the table A, seat B, slides C, standards D, bar E with foot-piece G, spring *a*, arm *b*, knife *f*, and rods *d*, all substantially as and for the purposes herein set forth.

143,798.—Machine for Gumming the Edges of Elastic Shoe-Gores.—JOSEPH WALDEN and GEORGE PLATTS, Newark, N. J. Application filed April 7, 1873.

The jaws *c c'* have their bearing in the ends of the trough I, which is partly filled with liquid gum. The jaws are immersed in the gum, raised, and opened to admit the edge of the fabric, when it is properly gummed on both sides and ready for insertion between the vamp and lining of the shoe.

Claim.—The gumming-jaws *c* and *c'* and gum-trough I, made and combined with reference to each other, to gum the fabric, as set forth.

143,799.—Game Apparatus.—PERSBURY WEST and GEORGE S. LEE, Worcester, Mass. Application filed June 6, 1873.

Wire pockets fastened to the ground, something in the order of croquet-arches, are played at with balls and mallets.

Claim.—1. The combination and relative arrangement of the devices marked and described as throne, castles, and bastiles, for playing an outdoor or field game, substantially as and for the purpose set forth.

2. The combination and relative arrangement of the devices marked and described as sortie, porte, throne, castles, garde, and bastiles, for playing an outdoor or field game, substantially as and for the purposes set forth.

3. The combination, with the parts A and B, of metal or other suitable material, constructed and combined together as shown and described, of the part *d*, to form a bastile and sections of the throne and castles, substantially as and for the purposes set forth.

143,800.—Reciprocating Churn.—EMERY T. WHEELER, Canelton, Ind. Application filed April 24, 1873.

Two vertical vibrating dashers, journaled in a frame on top of the churn-cover, are operated by a horizontal rod provided with two studs, which engage with a cam-wheel on the end of a horizontal driving-shaft. The rod is pivoted at its ends to wrist-pins on collars which surround the dasher-shafts.

Claim.—The construction and arrangement, with relation to a churn-cover, A, of the paddle-shafts B B, each carrying a slatted paddle, C, the frame D D', crank-shaft E, cam-wheel F, collars *a a*, connecting rod *b*, with studs, and wrist-pins *c c*, as and for the purpose set forth.

143,801.—Dandy-Roller for Paper-Machines.—JOHN WHITEHEAD, Manchester, England. Application filed July 21, 1873.

Claim.—The dandy-roll constructed with the bent or ring-shaped wires, arranged in planes radial to the axis of the roll, and secured by solder to the central shaft of the roll, and to the wires constituting the outer or circumferential portions provided to sustain the wire-cloth covering, substantially as and for the purpose specified.

143,802.—Apparatus for Lowering Weights.—THOMAS WRIGHTSON, Teesdale Iron Works, Stockton-on-Tees, England. Application filed September 13, 1873.

Coupled to a lever-beam is a piston working in a small hydraulic cylinder, in such manner that the piston must rise in the cylinder to allow the bell, which is coupled to the other end of the beam, to descend, and this is regulated by opening a valve in a pipe leading from one end of the cylinder to the other to allow water to pass at any required speed.

Claim.—1. The combination, substantially as before set forth, of the bell, the locking-rod, and stop, the hydraulic cylinder, the piston therof, and the regulating-tap.

2. The combination, substantially as before set forth, of the bell, the locking-rod, and stop, the hydraulic cylinder, and piston, and the means for forcing water beneath the hydraulic piston.

143,803.—Child's Carriage.—ALBERT F. R. ARNDT, Detroit, Mich., assignor to himself and W. DOELTZ, same place. Application filed June 21, 1873.

The ends of the handle are locked within the sockets by means of spring-catches.

Claim.—The socket B *d*, handle C *a'*, and spring-catch D *a*, combined and applied to a child's carriage, as and for the purpose described.

143,804.—Office-Slate.—CORNELIUS BOYLE, Washington, D. C. Application filed September 16, 1873.

Claim.—In combination with a frame or backing, A, the slate *f*, pivoted thereto by screws or journals *g*, arranged to pass through and slide up and down in slots *h* in said frame, for the purpose of drawing out and inclining said slate, so as more easily to be written upon, and of returning it to its recess, substantially as described and shown.

143,805.—Shutter-Fastening.—JAMES P. BUSH, Boston, Mass. Application filed August 18, 1873.

An elbow-lever, formed with a slotted end, and operating as a gravitating catch, is pivoted within a recess in the lower stile of the blind, and operated by a chain. The fastening has a stop-plate on the under side of the stile, and two catches.

Claim.—The elbow-lever C, provided with the operative chain F, and pivoted within a recess in the lower stile or part of the blind, and having a slot, G, in its lower end, in combination with the stop-plate H and the two catches D E, arranged in manner as specified, all being to operate as explained.

143,806.—Brick-Machine.—JOHN D. BUSH, Elyton, Ala. Application filed April 21, 1873.

A horizontally intermittingly rotating mold-table, an intermittingly-rotating receiving table, G, stationary table J, pressing and discharging plungers operated by means of tappet and tappet-wheel, a stop-bar, R, for holding the table during the pressing and discharging operation, said lever being provided with an anti-friction roller, and operated by means of a toe on plunger *g'* and the spring-finger *v* on bar R.

Claim.—1. The pressing-plunger *b'* and discharging-plunger *g'*, in combination with the intermittently-rotating mold-table G, stationary table or bed J, and receiving-table T, all arranged and operating substantially as described.

2. The double cam-shaft D, tappet *j*, and tappet-wheel *a*, combined with the pressing and discharging plungers *b' g'* and mold-table G, substantially as described.

3. The stop-bar R, provided with an anti-friction-roller, *s*, and operated by means of the toe *t* on the plunger *g'*, and the spring-finger *v* on the said bar R, substantially as described.

143,807.—Valve for Steam-Engines.—ADAM CARR, Paterson, N. J. Application filed August 1, 1873.

A plate with inlet and outlet ports is arranged between the main valve and the seat, and operated by tappets on the piston-rod. A piston-valve connected to the back of the main valve operates it, and the exhaust therefrom is opened at the same instant that the steam is cut off. A pipe connects the exhaust and steam-pipe with the cylinder, so that the steam-chest can be removed without disconnection.

Claim.—1. The ports S S in the valve-seat of the cylinder a, in combination with the connections for the pipes *w* and *s* upon opposite sides of said cylinder, substantially as described.

2. The slide-valve a, provided with the ports 12 and 14, and the secondary valve *i*, with the ports 11, 13, and 15, constructed and arranged as specified, so that the motion of the main valve a closes the port to the valve-moving cylinder *g*' or *g*², and simultaneously opens the exhaust from that cylinder, as and for the purposes specified.

143,808.—Ferry-Boat for Trains of Cars.—FRANK CAZE, New Orleans, La. Application filed August 9, 1873.

Claim.—The combination, with a navigable float or the hull of a vessel, of a vertically-adjustable deck or platform extending the entire length of the vessel, and carrying a railroad-track, substantially as and for the purposes set forth.

143,809.—Building-Block.—FRANCIS W. COLBY, Streator, Ill. Application filed April 11, 1873.

The perforation is available for flues, and the adjacent cavity is closed at the bottom for strength.

Claim.—The improved building-tile, having the open inner cell A and the outer cell B provided with a bottom, substantially as described.

143,810.—Oil-Can.—WILLIAM G. COWELL, Wallingford, Conn. Application filed August 30, 1873.

Consists of an oil-can with a heating-pipe attachment passing through it to conduct steam or other hot vapor or fluid in at the top and out at the bottom; also of an ejecting-pump, used for the purpose of pumping the oil into other small cans for use.

Claim.—The combination, with an oil-can, of a pump, C, and a pipe, B, the latter entering near top and passing down by the side of and under the pump C, as described, to maintain the oil in a state of sufficient fluidity to pass through and be discharged by said pump.

143,811.—Apparatus for Puddling Iron.—JOSEPH DAVIES, Knoxville, Tenn. Application filed August 9, 1873.

The puddling-tool is mounted near the middle on a support in front of the furnace. The tool can revolve within its support. The support slides laterally on its stand, and the stand is pivoted to swing toward or from the furnace, whereby universal motion of the tool is attained.

Claim.—The puddling-tool shaft D, pulley C, jointed revolving and sliding stand C' F, and the slotted and jointed bench H, combined and arranged substantially as specified.

143,812.—Smoke and Spark Conduits for Railroad-Trains.—THOMAS DE CODEZO, New York, N. Y. Application filed August 21, 1873.

A funnel-formed pipe in front of the uptake is inclined and combined with a pipe extending over the cars, and opens into the uptake above the level of the bottom of the conduit-pipe. This pipe is provided with elastic joints of flexible fire-proof material, having an internal spiral coil, and connected with the pipe by bayonet-joints.

Claim.—1. In combination with the uptake and pipe B, a funnel-formed pipe, E, opening in front of the uptake, inclined and opening into the uptake above the level of the bottom of the pipe B, substantially as set forth.

2. In combination with the uptake and sectional pipe B, the connections C, formed of a flexible fire-proof casing and internal spiral coil C², and connected with the pipes B by the bayonet-joint C¹, substantially as set forth.

143,813.—Vehicle-Wheel.—DANIEL DERRICK, Orwell township, Bradford county, Pa. Application filed October 2, 1873.

Claim.—The combination of the hub *c*, having the perforated flanges *c*, spokes *d*, and recessed nuts *e* in the felloe, substantially as shown and described.

143,814.—Machine for Forming Hat-Frames.—BIAGIO ERTOLA and ANGELO CASELLI, New York, N. Y. Application filed April 12, 1873.

The lower die is rotated by a crank-pin and lever working in a spirally-grooved vertical shaft. The upper die is supported in a sliding frame, to the lower cross-bar of which is attached a pivoted pressure-lever. The material is fed from a reel to the dies by means of a pair of feed-rolls, and passes in contact with a sponge fed from a trough by which it is damped. The bonnet-form is covered from the web by a rotating knife swiveled to the lower die.

Claim.—1. The grooved or slotted vertical shaft B, pin D, foot-lever E, and spring F, in combination with the circular table G for folding and rotating the lower form or mold H, substantially as herein shown and described.

2. The combination of the circular table J, short shaft K, cross-bar L, rods M, cross-bar N, foot-lever O, springs Q, and levers R, with the table G, grooved or slotted shaft B, pin D, foot-lever E, and spring F, for applying the pressure while allowing the molds or forms to be rotated together, substantially as herein shown and described.

3. The device for damping and feeding the hat material, consisting of the arms W, rod V, frame X, water-vessel Y, perforated pipe Z, rod B', sponges A', and adjustable elastic rollers C', substantially as shown and described.

4. The combination of a revolving knife, E', with rollers C' and formers H I, for clamping the fabric, as and for the purpose specified.

143,815.—Automatic Railroad-Signal.—JANE D. EVANS, West Chester, Pa., executrix of HENRY S. EVANS, deceased. Case B. Application filed July 29, 1873.

A signal-arm operated by chains passing over a shaft from which it projects, and connected with levers extending under the rails. A trip-wheel upon one side of the engine moves different levers, according to the direction the train is going. Each signal is connected with and operates another at a distance.

Claim.—The arrangement of the signals C, connecting chains or wires D, chains or wires F, levers G and H M, and the inclines K and L with each other, substantially as herein shown and described.

143,816.—Grinding-Mill.—PRICE EVANS, New York, N. Y. Application filed August 4, 1873.

Stationary stone pivoted upon its support, so that it can be turned in a horizontal position for dressing.

Claim.—A fixed stone, J, combined with a standard, L, as described, the former turning vertically in and horizontally with the latter.

143,817.—Harness-Mounting.—THOMAS FAWCETT, New York, N. Y. Application filed May 5, 1873.

Claim.—The terret-ring *a*, having the inside-edge grooves *c c* and intermediate rib, combined with the leather covering *d*, having its edges fitted in said grooves, and the inner ring *e*, having its edges forced down upon the leather edges, in the manner and for the purpose described.

143,818.—Child's Carriage.—THOMAS GALT, Rock Island, Ill. Application filed August 30, 1873.

Claim.—The body of a child's perambulator mounted on the frame with rockers, so that it can be used as a cradle, and provided with hooks to prevent rocking, substantially as specified.

143,819.—Slide-Valve Mechanism.—EBENEZER E. GILBERT, Montreal, Canada. Application filed May 10, 1873.

Within end tubes formed in the slide-valve two guide-rods, closely fitting therein, are held movably in position between guide-brackets to permit it to lower itself as fast as the friction causes wear. The auxiliary valve, operated by means of a rock-shaft connected by a pitman to the reciprocating rod of the piston, (arranged alternately to admit steam between the aforesaid guide-rods and end tubes,) is so constructed as to form a cushion for the prevention of noise.

Claim.—1. The combination, with main valve C, having end tubes D², of guide-rods D¹, having flanges *d* arranged loosely in brackets *b*, as and for the purpose described.

2. The auxiliary slide-valve E, having the subjacent cavities *e e* and partition *e*¹, combined with the main slide-valve C, having passage *g*, and recesses *f' f'*, and tubes D² with passages *f*, as and for the purpose set forth.

143,820.—Wheel for Vehicles.—JOSEPH H. GLOVER, Freedom, Ky. Application filed June 28, 1873.

The tire may be readily removed and replaced and tightened by the contraction and expansion of the wheel, and the wheel may be lubricated without being taken off the axle.

Claim.—The rim I, made convex upon its inner side, and concave upon its outer side, in combination with the forked spokes E, the plate D, the plates F, nuts G, and tube A, substantially as herein shown and described.

143,821.—Flour-Bolt.—WILLIAM GOSEHORN, Waterloo, Pa. Application filed July 19, 1873.

Flour is bolted through stationary cloth by centrifugal force, imparted by the rotating fans, which also cools the material and prevents cloth clogging.

Claim.—The rotary fans *g h h' i* on vertical shaft, combined with a stationary vertical cloth, C, as and for the purpose described.

143,822.—Ice-Cream Freezer.—MILLER F. GRAVES, Sunbury, Pa. Application filed August 9, 1873.

The perforated tube permits direct contact between the cooling medium and the cream-vessel, but prevents the falling of the ice, &c., when the cream-vessel is withdrawn.

Claim.—The tube B, placed between the ice and cream-vessel, reticulated or side-perforated, as and for the purpose described.

143,823.—Implement for Edge-Trimming Soles.—ARTHUR P. HAZARD, North Bridgewater, Mass. Application filed September 2, 1873.

Claim.—1. The gage D, having compound adjustments, as described, in combination with the blade B, the furcated block C provided with the guard *c*, chip-throat *b*, and clamp-screw *e*, substantially as and for the purpose set forth.

2. In a sole-trimming device, constructed as set forth, the guard *c*, as made with a convex bearing-surface, as and for the purpose stated.

143,824.—Steam Pumping-Engine.—WILLIAM CLEVELAND HICKS, Summit, N. J. Application filed May 23, 1871.

On the shaft of a steam-pump is secured a gear-wheel, meshing into a pinion on a secondary shaft. This shaft is provided

with a weighted lever, which is to assist the revolution or reciprocating movement of the piston, over its centers.

Claim.—The combination, substantially as set forth, of a steam-cylinder, with its piston, piston rod and valve, and valve apparatus; a water-cylinder, with its valves, piston, and piston-rod, connected with said steam-piston and piston-rod; a crank, and a continuously-revolving crank-shaft provided with a toothed gear, with a counter-shaft provided with a pinion having one half the number of teeth meshing into said gear in the said main crank-shaft, and also provided with a crank to which is connected a weight or spring, in such manner as to cause the crank on the main shaft to pass over its centers, substantially in the manner described.

2. The combination, substantially as herein described, of a reciprocating piston-rod, connected to a crank on a revolving crank-shaft, provided with a toothed gear, with a counter-shaft provided with a pinion having one-half the number of teeth meshing into said gear on the main crank-shaft, and also provided with a crank to which is connected a spring or other elastic force, in such manner that the said spring is strained by the revolution of the main shaft, and exerts its force in the opposite direction to cause it to pass its centers twice each revolution, substantially as herein set forth.

143,825.—Safety-Valve.—James Hoffman, Belvidere, N. J. Application filed February 8, 1873.

The safety-valve is raised and steam admitted into a cylindrical space in which a loose piston is fitted, which rises independent of the valve, and allows steam to escape through side apertures in the cylinder.

Claim.—The enlargement B of the escape-pipe, with lateral escape-passages C, above the seat of the safety-valve, and the valve F combined with the valve D, substantially as specified.

143,826.—Corn-Planter.—Charles Hutchins, Aubrey, Kans., assignor to himself and Abram Large, same place. Application filed August 30, 1873.

To the front bar of the main frame is pivoted an additional frame, carrying the seed-dropping mechanism and the driving and marking wheels, which are raised from the ground at pleasure by a foot-lever. The main frame rests upon wheels having concave rims for covering the seed.

Claim.—1. As an improvement in corn-planters, the combination of main frame A, having concave wheels C, lever L, and seat M, with the pivoted frame B, having plows F and the seed-dropping and row-marking mechanism, substantially as specified.

2. The combination of cross-beam E, pivoted frame B, hoppers G, slide-pieces H, and springs *g*, with front wheels C, having notched pieces *h'*, forming the seed-dropping mechanism, as described.

143,827.—Reciprocating Engine.—Samuel J. Jones, Helena, Montana, Ter. Application filed May 31, 1873.

The shuttles are thrown by steam admitted between them and the piston, and, by contact with the pins, operate the valves governing the ports opening into the atmosphere. The steam thus admitted is condensed to form a vacuum, into which the piston is forced by atmospheric pressure.

Claim.—1. The cylinder C, constructed with steam-inlet ports L M, water-port N, and air-ports F G', combined with a reciprocating piston, B, and disks D E, to allow the piston to be operated by steam, air, and water, in the manner described.

2. The disks D E, arranged loosely on rod C, and on each side of piston B, combined with the pins K, for the purpose of operating the valve mechanism, as set forth.

3. The springs U V, arranged one on each side of piston B, and both upon the rod C, to take up the shock from the impact of piston upon the disks, as specified.

143,828.—Car-Coupling.—Richard Lloyd, Cleveland, Ohio. Application filed July 5, 1873.

The coupling-bars are so jointed to the draft-bars that they may be capable of elevation, but not of depression, and the inner faces of the hooks are V-shaped to prevent accidental uncoupling when turning curves.

Claim.—The coupling-bars B, provided with V-shaped and inclined or dovetailed shoulders *b'* upon their upper and lower sides, and at different distances from the points of said bars, and jointed to the ends of the draw-bars A, substantially as herein shown and described.

143,829.—Machine for Scouring, Glassing, or Setting Leather.—Frederic A. Lockwood, Winthrop, Mass. Application filed June 9, 1873.

Claim.—1. In machinery for scouring, glassing, or setting leather, or beaming hides, the combination, with the table or bed for supporting the skin, of a tool carrier or stock arranged and operated to move or travel to cause the tool or tools carried by said stock to properly act upon the skin substantially as shown and set forth.

2. In machinery for scouring, glassing, or setting leather, or beaming hides, the combination, with the work-supporting table or bed, and a tool carrier or stock capable of variable movements over said table, and mechanism for imparting said movements to said stock, of a sliding head carrying said tool-carrier and its operative mechanism, and vertically adjustable with respect to the table, substantially as and for the purposes shown and set forth.

3. In machinery, the combination, with the tool-carrier and its operative mechanism, of an expansible crane supporting said parts, substantially as and for the purpose shown and set forth.

4. In combination with the expansible or variable frame or crane G, and rod or shaft H, the swinging beam I, whereby a uniform altitude of the stock or carriage, with respect to the plate D or other support of the crane, is maintained, substantially as and for purposes stated.

5. In combination the plate D or its equivalent, variable crane G, and beam I, substantially as and for purposes stated.

6. In combination the carriage K and the variable crane G, substantially as and for purposes stated.

7. In combination with the crane G and the rod H or its substitute, the pulleys *f f*, &c., or their equivalents and bands *g g*, &c., for imparting motion to the tool-stock, substantially as and for purposes stated.

8. In machinery for scouring, glassing, or setting leather, or beaming hides, the combination of a rotary work-supporting bed or table and a tool carrier or stock, arranged and operating to move in any direction over or with respect to said table, substantially as and for the purpose shown and set forth.

9. The epicycloidal wheels M and O, for imparting reciprocating motions to the tool-stock in a horizontal plane from the rotary motion of the shaft or rod H, substantially as and for purposes stated.

10. The channels Q, formed, as described, with a central partition or guide, *n*, substantially as and for purposes stated.

11. The latches *p p*, or their equivalents, in combination with the channels Q, substantially as and for purposes stated.

12. In combination with the tool-stock B and channels Q, the ears *l' l' l' l'*, or their equivalents, for determining the altitude of each tool during its traverses, substantially as and for purposes stated.

13. The brush *w*, mounted within or upon the tool stock or carrier, substantially as herein shown, whereby it may be raised or lowered with respect to the tools, substantially as and for purposes stated.

14. The combination of the knocking-over or tripper arms *c'* and spring-latches *f'*, or the equivalents of the same, whereby, while the tool-stock is in motion, the raising or lowering of the brush may be effected, substantially as and for purposes stated.

15. The combination, with the latches *p p*, of the bails or handles *g'*, or their equivalents, whereby, while the tool-stock is in motion or otherwise, the course of the ears *l l'* and tools are changed with respect to two portions of the groove Q, substantially as and for purposes stated.

16. In machinery for scouring, glassing, or setting leather, or beaming hides, a carriage susceptible of universal freedom of motion and supporting a tool-stock, and a tool-stock traversing such carriage in reciprocating rectilinear movements, substantially as and for purposes stated.

17. In machinery for scouring, glassing, or setting leather, or beaming hides, a tool-stock reciprocating in an arbitrary horizontal path upon a suitable carriage, and one or more tools or tool-holders under the arrangement and for operation as shown and described, so that during the reciprocation of the stock the slope of the tools with respect to the stock may be varied, in order not only that the tool may be lowered upon the skin when moving in one direction, and raised therefrom when moving in the opposite direction; but, if desired, elevated entirely above the skin and out of action during both traverses, substantially as and for purposes stated.

18. The grooves *f'*, for guiding the tool stock in a horizontal path, in combination with the channels Q and latches *p p*, substantially as and for purposes stated.

19. The combination, in a machine for scouring or setting leather or working hides, of a brush capable of being lowered into working position or raised therefrom, and one or more reciprocating tools which are susceptible of acting upon a skin or traversing a path above such skin and free from contact, substantially as and for purposes stated.

143,830.—Lubricating Pulley.—J. King McLanahan, Hollidaysburg, Pa. Application filed August 1, 1873.

The wire feeder is secured to the inner periphery of the wheel, and the tube to the hub of the pulley. By the revolution of the pulley the oil within the chamber will be thrown against the wire feeder, and thus carried to the journal.

Claim.—The wire feeder *d*, in combination with the tube *b*, connected with the inner periphery of the wheel within the oil-box B, as shown and described, to operate as specified.

143,831.—Seal-Lock, &c.—Daniel K. Miller, Philadelphia, Pa. Application filed July 14, 1873.

The spring-tumblers are provided with notches so inclined in respect to the direction of the movement of the fence on the dog or bolt as to automatically eject the said dog or bolt in locking. The bolt or hasp is also provided with a recess for the reception of a seal, and the device for destroying or defacing the said seal is arranged so as to move with the said bolt or hasp.

Claim.—1. A lock having spring-tumblers with notches inclined in respect to the direction of the movement of the portion of the dog or bolt adapted to the same, and serving as automatic ejectors for the said dog or bolt in locking, all substantially as described.

2. A seal-lock in which the seal and the device for destroying or defacing the same are attached to and move with the bolt or hasp, substantially as herein described.

143,832.—Seed-Planter and Fertilizer-Distributer.—Richardson Montfort, Butler, Ga. Application filed May 24, 1873.

The hoppers and feeding-shoes are so formed that, when the shoes are raised, the feed can be entirely stopped, if desired, when moving from one point to another.

Claim.—The vertically-adjustable supplementary distributing hoppers G and an adjusting apparatus, as described, in combination with the stationary receiving-hoppers I, having a form at their lower ends corresponding with that of the movable hoppers, whereby the discharge of seed may be regulated in quantity or entirely arrested, as set forth.

143,833.—Means of Keeping Open the Navigation of Canals, &c.—John Mullaly, New York, N. Y. Application filed April 11, 1873.

Claim.—1. A vessel provided with a furnace, boiler, superheater, and tank, or equivalent device, for discharging superheated steam into or upon the water of the river or canal, for the purpose of raising the temperature of the said water to prevent the formation of ice, as set forth.

2. A boat or movable water-vessel provided with a furnace or heater, and with external radiating pipes, arranged substantially as shown, to receive heat from said furnace or heater and diffuse it into or upon the water of a navigable stream for the purpose of keeping the navigation open, substantially as specified.

3. A boat or movable water-vessel provided with a furnace, steam-generator, and means for discharging steam into or upon the water in sufficient quantities to open or prevent the closing of navigation on canals or other navigable streams in winter, substantially as and for the purpose specified.

143,834.—Machine for Melting Snow.—John Mullaly, New York, N. Y. Application filed April 11, 1873.

Movable plates are so combined with the furnace that they may be alternately heated and lowered, and against which the snow is thrown by a revolving brush-cylinder.

Claim.—The combination, in a machine for melting snow, of a furnace, a movable plate or plates receiving heat from said furnace, and a brush or brushes so arranged as to throw the snow against said plate or plates to be melted, substantially as specified.

143,835.—Toy Block for Object-Teaching.—Nicholas Muller, New York, N. Y. Application filed July 5, 1873.

Claim.—The combination of two sets of toy blocks, one being formed of acute-angled and the other of obtuse-angled blocks, all the sides which embrace the obtuse and smallest acute angle being equal, as set forth, whereby pentagons, pentagrams, and an almost infinite variety of proportional geometrical forms can be constructed.

143,836.—Standard for Stools, Tables, &c.—Samuel H. Newcomb, Port Williams, Nova Scotia. Application filed June 28, 1873.

The legs are hinged together and to a central shaft, and are provided at their outer top ends with projecting lugs, which enter recesses made in the under side of the supporting-top. Wedged-shaped pins on the shaft enter corresponding holes in the legs, and secure the connection between the shaft and legs.

Claim.—The hinged legs *a*, the center shaft *b*, and the support B, constructed and combined, as shown and described, to form a stand for a piano-stool, center-table, work-stand, clothes-rack, or analogous article.

143,837.—Car-Starter.—Benjamin F. Oakes, Milford, Me. Application filed May 31, 1873.

To the short arms of a T-shaped lever, which may be attached to the draw-head of a car, are pivoted clamping-levers, the ends of which have a grooved foot to clamp the rail. By moving the main lever horizontally, the car may be either drawn or pushed.

Claim.—The lever B, having a head adapted to be pivoted directly or indirectly to the draw-head of a car at its middle, and provided at each end with an arm, D, having a gripe, F G H, so that the lever may be vibrated horizontally to each clamp-arm, acting alternately to hold the rail and give purchase to the operator, as set forth.

143,838.—Street-Sweeping Machine.—Lemuel J. O'Connor, Chicago, Ill. Application filed August 23, 1873.

An adjustable train of gearing connects the main driving-wheel with the shaft of the brush, which is adjusted vertically by a sliding rack-bar without interrupting the rotary motion of the brush. A curved sheet-metal hood is placed over the brush, and is connected with the fan by a pipe, through which the dust and dirt are drawn.

Claim.—1. The curved hood E, arranged over and covering the front upper portion of the rotary brush or broom, and having a pipe, U, connected to it at the center, and leading upward to the fan, as shown and described.

2. The arrangement of the driving-wheels N O P said bars Q with the sweeper-shaft and the adjustable supports F, substantially as specified.

143,839.—Automatic Gate.—George W. Olbert and William Young, Barr's Store, Ill. Application filed July 19, 1873.

A pendent gate is connected by cranks and rods with treadles arranged parallel to and on opposite sides of the road, which treadles, when depressed by the wheel of a vehicle, swing the gate up and clear of the passage-way.

Claim.—The combination, with the gate-frame A, of the gate B, cranked shaft C, connecting-rods E, and treadles F, substantially in the manner described.

143,840.—Milk-Cooler.—James Pearl, Lawrenceville, N. Y. Application filed July 19, 1873.

The water-chamber is formed by an upper and lower surface of sheet-metal, painted on both sides to prevent oxidation, and having longitudinal partitions pierced at the ends to form a continuous channel.

Claim.—The two metallic plates clamped over and under the section B by a bolted top and bottom, in the manner described, to enable all parts of the device to be conveniently taken to pieces cleaned, and again readily put together.

143,841.—Paint Compound.—James Quarterman, Flushing, assignor to Adaline M. Ingersoll, Brooklyn, and Fredk. J. J. Quarterman and Elizabeth Quarterman, Flushing, N. Y. Application filed April 16, 1873.

A.—Water, nine gallons; soda-soap, eight pounds. Dissolve by heat, and use hot.

B.—Water, nine gallons; sal-soda or borax, two and a quarter pounds; gum-shellac, four ounces; molasses, two and a half pints; sugar, three pounds. Dissolve by heat; use cold.

C.—French zinc or white lead ground in linseed-oil, one hundred pounds; boiled linseed-oil, four gallons; japan-varnish, one gallon; patent drier, two pounds; ultramarine blue, half ounce; turpentine, two gallons; formula B, four gallons; formula A, two gallons. Mix well, and is ready for use.

Claim.—As a new article of manufacture, a liquid paint composed of the ingredients herein described in formulæ A B C, and compounded and prepared in the manner specified.

143,842.—Sectional Steam-Generator.—David Renshaw, Philadelphia, Pa. Application filed February 4, 1873.

A tubular chamber around the reverberatory furnace, forming a base, and also a mud-drum, communicates with the hollow shell and suspended segmental pipes, which latter are cast together in sections, forming a furnace-chamber and generator, and are surmounted with the usual steam-drum.

Claim.—The combination of the base B, the sections A' E, made with the projections and caps *a*, and the steam-drum G, placed outside, substantially as shown.

143,843.—Sectional Steam-Generator.—David Renshaw, Philadelphia, Pa. Application filed February 4, 1873.

Claim.—1. The internal section E, formed of a continuous curved pipe with inner arches F', as described, said arches being of less diametrical dimensions than the pipe E, so as to produce circulation, as specified.

2. In a reverberatory furnace, the combination of the sections F, formed of a continuous curved pipe, made with the inner arches F', the tubular water-chamber E, and steam-drum B, substantially as shown.

143,844.—Sectional Steam-Generator.—David Renshaw, Philadelphia, Pa. Application filed February 4, 1873.

Claim.—1. The flat stay-bolted sections D, arranged laterally within the furnace, and crossing the longitudinal center thereof, and having communication with the longitudinal water-chambers beneath, said sections being arched above and below, substantially as shown and described.

2. The combination of the reverberatory furnace and steam-drum E with the flat stay-bolted sections D, arranged laterally within the furnace, and crossing the longitudinal center thereof, and having communication with the longitudinal water-chambers beneath, said sections being arched above and below, substantially as shown and specified.

143,845.—Sectional Steam-Generator.—David Renshaw, Philadelphia, Pa. Application filed February 4, 1873.

Claim.—1. The base C, constructed of flat sections, stay-bolted, as set forth, being of the same width as the upper part of the furnace, and connected therewith by means of flanged projections, substantially as set forth.

2. The horizontal internal sections E, constructed as shown, each section extending from the front to the rear of the furnace, and communicating with the base and upper sections by means of the curved pipes *e e'*, as described.

3. The combination of the base C, upper sections B, inner sections E, and drum F, substantially as specified, said base C and section B being of the same width and stay-bolted, and each of the sections E extending from the front to the rear of the furnace, as specified.

143,846.—Superheater.—David Renshaw, Philadelphia, Pa. Application filed February 4, 1873.

Steam enters at the branch pipe, ascends the larger pipe D, where the volume is broken, and again broken into jets on passing through the perforations into the superheating globe, where the temperature becomes equalized, and the steam superheated passes off through the eduction-pipe to the cylinder, the said eduction-pipe being smaller than the induction, for the purpose of retaining the steam longer in the superheater.

Claim.—1. In a superheater, an induction-pipe, arranged partly above and partly below the grate, substantially as specified.

2. In combination with a supply-pipe of a superheater, an induction-pipe of greater diameter than said supply-pipe, as and for the purpose set forth.

3. In combination with an inner induction-pipe, a superheater, receiving steam from the former, as specified.

4. The induction-pipe, constructed as described, with perforations, in combination with the superheater, within which it is arranged, substantially as and for the purpose set forth.

5. The superheater-globe, provided with an inlet and outlet extension, as described, the latter being of less capacity than the former, for the purpose specified.

143,847.—Electric Clock.—Frederick J. Ritchie, Edinburgh, Scotland. Application filed October 8, 1872.

The pendulum-rod, suitably insulated, and, in connection with subsidiary dial movements, actuated by means of electro-magnetic attraction of its bob, vibrates between two spring-contact points for reversing the current, and operates the escapement or ratchet wheel by a gravitating impulse-pallet on one side, with a notched detent arm on the other side.

Claim.—1. The insulated springs B C, with their respective connections d^5 e^1, in combination with master pendulum A and the connection e^3 a^3 to one or more sympathetic clocks, as herein specified.

2. The positive detent M′, as constructed with notch k, in combination with ratchet-wheel L, pendulum F, and impulse-pawl M, as shown and described.

143,848.—Tenoning-Machine.—William M. Sack, Oakland, Cal. Application filed January 24, 1873.

The wide tenons previously formed on the ends of the rail are cut by rotary cutters moved to the middle, while a boring-tool is automatically moved up to bore the slot in the middle for the end of the slat-bar to fall into.

Claim.—1. The tracks *b b*, with their adjustable permanent frames *c c* and sliding frames E E, in combination with the rod *d*, with its right and left hand screws and screw-rod A, operated from the rod by means of the toothed wheels *f f*, substantially as and for the purpose above described.

2. The adjustable frames *c c*, in combination with the sliding frame E with its short shaft *f*, cutter *g*, and stop bar I, substantially as and for the purpose above described.

3. The operating crank-shaft I, with its fixed arm *m*, the extremity of which is connected with the screw-rod A and universal joint *o*, substantially as and for the purpose above described.

4. The transverse vertical frame S, with its sliding frame *w*, carrying the vertical shaft V with its hollow screw-tipped auger Z and its operating mechanism, substantially as and for the purpose above described.

5. A machine for relishing the end rails of blind-frames, the same consisting of two adjustable sliding frames, E and C, carrying revolving cutters, and a vertical transversely-moving frame carrying a vertical side-cutting auger, all constructed, arranged, and operated substantially as and for the purpose above described.

143,849.—Mode of Securing Wheel-Hubs to Shafts.—Edwin Sanford, Hartford, Conn. Application filed July 19, 1873.

The bore in the hub is larger than the shaft, having grooves in which the gibs or keys secure the wheel and true them on the shaft by set-screws.

Claim.—The screws E, nuts G, and gibs D combined, as described, with the hub A, having three or more radial and equally-distant inside grooves, C, as and for the purpose described.

143,850.—Measuring-Faucet.—Jacob Schalk, Jr., Guttenberg, N. J. Application filed June 14, 1873.

A tank has an interior measuring-chamber, the plug of whose outlet-cock projects inside, terminating in a gear-wheel which takes into another gear on the plug of its inlet-cock. Opening the outlet closes the inlet and opens a vent-tube connected therewith, and vice versa.

Claim.—1. The two cocks, having their hollow plugs terminating in the open frames E J, connected by gears K L, in combination with reservoir and interior measure B, substantially as described.

2. The vertical cock D, operated by a gear connection with an outlet-cock of measure B, in combination with the air-tube G, substantially as described.

143,851.—Hot-Air Furnace.—Charles J. Shepard, Brooklyn, N. Y. Application filed January 16, 1872.

Claim.—1. The combination of the grate G and fire-bed I, located as described and shown, with the dome K, for the purposes stated.

2. The suspended ash-pit F placed between the flues D^2, substantially as shown.

143,852.—Stove-Pipe Thimble.—Thomas D. Slauson, Havana, N. Y. Application filed August 16, 1873.

The inner casing is designed to project through the plastering of the wall, while the adjacent end of the outer casing is notched or slit, so that when the slit portions are bent at right angles they form a support for the mortar of the plastering between the ends of the lath and the inner casing. The outer casing is perforated for ventilation, and it is secured to the inner one by metal strips.

Claim.—The stove-pipe safe, consisting of outer casing B, with face-pieces D and side apertures *a*, inner casing C, connected by strips E, and held thereby in position in partition A, arranged substantially as and for the purpose described.

143,853.—Truck for Carrying Bricks.—Robert A. Smith, Newburyport, Mass. Application filed June 25, 1873.

Designed to transport bricks from a molding-machine to a brick-yard, or from a brick-yard to a kiln.

Claim.—The transporter I, provided with the transverse bearers *l* and the folding plank or shelves *m*, combined with carriage-platform *a*, substantially in manner and to operate as described.

143,854.—Spring-Bed.—Samuel Smith and John H. Gill, Williamsburg, N. Y. Application filed July 25, 1873.

The top and bottom portions of the bed have helical springs between them, each formed of a pair joined at their apices, their bases above and below. Some of these are in cases of the same outer form for the purpose of stability.

Claim.—The cases D and coiled conical springs E, in combination with the bottom and top straps A B of a spring-bed, substantially as herein shown and described.

143,855.—Revolving Fire-Arm.—William S. Shoot, Ilion, N. Y., assignor of one-half his right to E. Remington & Sons, same place. Application filed August 2, 1873.

Claim.—1. As an improvement in revolvers, the barrel, bridge-stop, lock-frame, and upper portion of the handle made of a single piece, in combination with the guard-strap, united thereto by a longitudinal joint, substantially as described.

2. The center-pin C held in place by the spring *l* of the ejector-rod I, substantially as described.

3. The center-pin C, provided with the projecting guide or eye *d*, in combination with the sliding ejector I, the said parts being constructed and arranged to operate as set forth.

4. The recoil-shield F, provided with an opening, *b*, in its edge, and arranged to turn in rear of the cylinder far enough to open or close the passage through which the cartridges are inserted or removed, substantially as described.

5. The rotating shield F, having on its face a projection, *a*, which extends in a reduced or narrow strip around the central hub on which the shield turns, substantially as and for the purpose set forth.

6. The shield F, in combination with the spring *n*, arranged to hold the shield in position when opened or closed, as set forth.

7. The stop L, provided with the rounded shoulder or projection *p*, in combination with the spring *o* located upon the hammer, said parts being constructed and arranged to operate substantially as described.

143,856.—Grate for Stoves, Furnaces, &c.—Samuel Smyth, East Bridgewater, Pa. Application filed July 19, 1873.

The two-part grates are revolved by means of connecting-gearing on the ends of the shafts upon which they are mounted, so that they separate and allow the clinkers at the bottom of the fire to drop, while the curved bars or rear portions of the grates are brought into position between the falling clinkers and the coal above, which is thereby sustained.

Claim.—The two-part grates *d* with the curved bars *a*, and each sectional grate mounted on a separate shaft and capable of being rotated, as and for the purposes set forth.

143,857.—Watchmaker's Staking-Tool.—John Stark, Waltham, Mass. Application filed June 25, 1873.

The standard is arranged eccentrically, with the bed and the arm carrying the tool provided with a slot and set-screw for adjustment with either of two or more rows of concentric holes arranged in the bed.

Claim.—1. The improved staking-tool, constructed substantially as described, viz., with a slotted arm, B, and its clamp-screw E, combined with the guide A, as explained, and with an arm-supporter or post, C, arranged eccentrically on the stationary bed D, at or near the edge thereof, all as shown.

2. Two or more series of bed-holes, arranged concentrically with the post C or the pivot of the slotted arm.

143,858.—Alarm Safety-Valve.—Ferdinand Stehle, Brooklyn, N. Y., assignor to himself, Herbert S. Jewell, and Edward M. Jewell, same place. Application filed March 6, 1873.

The valve is held down by removable weights in a case which surrounds the valve-stem. Steam lifts the valve, passes through the case, and blows the whistle. A push-pin is used to raise the valve.

Claim.—The pressure-alarm composed of the whistle surrounded by a perforated cap, *i*, and attached to the cover *l* of the cylinder *d*, in combination with the case *e*, removable weights and valve *b*, that are within the cylinder *d* and above the valve-seat, and the push-pin *o*, the parts being secured by the locking-rod, as set forth.

143,859.—Pen and Pencil Case.—Charles H. Streightoff, New York, N. Y. Application filed September 27, 1873.

The slots are so arranged that the case may be extended farther when the pencil is drawn in than when it is out.

Claim.—The slot c^1 of the inner sliding tube E, made with an offset, c^2, in the middle part of the tube E, and with its rear part parallel to but not in line with its forward part, substantially as herein shown and described.

143,860.—Check-Rein.—George J. Townley, Parma, Mich. Application filed May 24, 1873.

The check-rein, which is indirectly attached to the driving-reins, acts upon the forehead of the horse, through the head-stall.

Claim.—The check-rein *a*, pulley *e*, and strap *f*, in combination with the head-stall of a horse, when arranged to operate as and for the purposes described.

143,861.—Picture-Frame.—John L. Warren and John W. Addersley, Detroit, Mich. Application filed March 6, 1873.

The fillet is made of a separate piece, which is afterward inserted in a rabbet of the body, and permanently attached thereto by brads, glue, or both.

Claim.—The combination of the molding A, having the rabbet *a*, with the fillet A′, as and for the purpose described.

143,862.—Lightning-Rod.—Joseph S. White, Juliustown, N. J. Application filed May 31, 1873.

The rod, having the form of an I-beam, is joined at its ends by means of a slot in the central or web portion of each, allowing them to interlock when the said webs are at right angles to each other. The ends are secured together by rivets or pins.

Claim.—A lightning-rod composed of sections grooved on two opposite sides, split at each end in a plane bisecting the grooves, and having full faces on the other sides, as described, so that they will form a rectangular joint, in the manner described.

143,863.—Process of Forming Orifices and Necks on Glass Articles.—Joseph Wing, Boston, assignor to New England Glass Company, East Cambridge, Mass. Application filed August 6, 1873.

Article—lamp, for instance—being formed, a portion of hot glass is placed on spot where orifice and neck are desired, which softens the glass underneath and renders it fit for manipulation with a proper perforating or forming tool.

Claim.—The above-described process of forming the filling necks and orifices on glass lamp-fountains, &c., the same consisting in superimposing at the desired point of the fountain, when formed, a quantity of molten glass, sufficient to form the neck, and subsequently inserting the superimposed and the underlying portions in manner as stated.

143,864.—Mold for Glass Lamp-Fountains.—Joseph Wing, Boston, assignor to New England Glass Company, East Cambridge, Mass. Application filed August 6, 1873.

Mold constructed to form central tube of an argand lamp complete with body of fountain at one operation.

Claim.—In a mold for forming glass argand-lamp fountains, constructed substantially as described, the core F, the spindle or auxiliary core *e*, and the male die or pressor D, constructed, combined, and operating together in manner and for the purpose set forth.

143,865.—Preparing Soluble Cotton for the Manufacture of Collodion.—Henry T. Anthony, of New York, N. Y., assignor to E. and H. T. Anthony & Co., same place. Application filed October 7, 1873.

The cotton is prepared by the acid mixture, washed and dried in the usual manner, after which it is subjected to the fumes of ammonia or other volatile alkali, to neutralize any remaining free acid.

Claim.—The method of preparing soluble cotton by subjecting the same to volatilized alkali after the ordinary acid treatment and washing, substantially as set forth.

143,866.—Mold for Sealing-Wax.—Isaac L. Baker, Dayton, Ohio. Application filed April 11, 1873.

Claim.—The grooved metallic plate A and congealing-bars C, constructed and arranged substantially as described, and for the purpose set forth.

143,867.—Grinding-Mill.—John G. Baker, Philadelphia, Pa., assignor to The Enterprise Manufacturing Company, same place. Application filed July 5, 1873.

Devices for securing grinding burr and shell in casing, so as to be readily removed when necessary.

Claim.—1. The combination, substantially as described, of the fixed shell G and its lugs with the slotted lugs and recesses in the upper and lower halves of the casing, between which the said shell is retained, as set forth.

2. The combination of the flange F′ of the shell with the partition N, cast in the upper portion A of the casing, and forming, with the said flange, a chute, as set forth.

143,868.—Ventilator for Buildings.—George E. Barker, Philadelphia, Pa. Application filed August 2, 1873.

The vitiated air flows down through adjustable openings around the hot-air pipe into a conduit-pipe leading to the chimney, within which pipe is arranged a valve, to allow the hot air, when the room becomes too warm, to pass out.

Claim.—In combination with the hot-air flue A and its ventilating-plate D and register-plate *d*′, the surrounding vitiated-air chamber B and exit-pipe b^{10}, and the surrounding series of openings in the floor-plate with their annular register-plate *d*′, the said parts being constructed to operate substantially as and for the purpose set forth.

143,869.—Washing-Machine.—John Bennett, El Paso, Ill. Application filed May 27, 1873.

In a rectangular box is a wash-board resting upon Z-shaped springs. Above is a rubber moved by arms that move in wire guides attached to side boards on the top of the box.

Claim.—The combination and arrangement of the wash-board H, having the Z-shaped side pieces, rubber head F, brackets F^1 F^1, rails F^2 F^2, guide-rods *g g*, attached to the removable guide-boards G G, and the wash-box A, all constructed and operated substantially as and for the purpose set forth.

143,870.—Machine for Making Earthenware Pipe.—James Bingham, Philadelphia, Pa., assignor to himself, F. L. Carnell, and D. K. Carnell, same place. Application filed February 19, 1873.

A cylinder in which clay is put in at the top and forced down by propelling-knives attached to a central revolving shaft, through a die at the bottom to form the pipe.

Claim.—1. The combination of the cylinder A with flange *b*′, the die D with flange *b*, the core E, ring *a*, and rods *d e*, all constructed substantially as and for the purposes set forth.

2. The combination of the cylinder A with shaft B and stirrers C C, the die D, core E, ring *a*, clamps G G, and knives H H, all constructed and operating substantially as set forth.

143,871.—Knife Polisher and Sharpener.—Theodore Bootsmann, Tompkinsville, N. Y. Application filed July 1, 1873.

Claim.—The strips G G, of hardened steel or equivalent material, attached to the jaws C D, which strips are arranged on the side of such jaws, and intersect each other when the same are closed, so that the sharpening and polishing processes may be accomplished simultaneously.

143,872.—Apparatus for Transferring Embroidery-Patterns.—Charles Bordas, New York, N. Y. Application filed June 14, 1873.

Apparatus for transferring embroidery-designs from a perforated pattern, which is held at the proper tension in a hinged frame upon a table. The blank sheets to receive the transferred design are placed upon the table under the perforated pattern on the frame. As the pattern is printed on each one the frame is opened, and it is removed in order to print the next, and so on.

Claim.—1. A frame, B, a removable clamp, H, and a sliding clamp, L, combined with a table, A, to enable the pattern-sheet to receive tension, in the manner described.

2. The eyes S, the cord C, and the spiral springs R, combined to enable the clamp to be conveniently adjusted to the proper degree.

3. A sheet-stretcher, L, constructed with a ribbed bed-piece, and provided with a grooved and hinged clamp, as, and for the purpose specified.

143,873.—Means of Raising Floating Timber and Loading Vessels therewith.—Adam Bulman, Newburg, N. Y. Application filed April 19, 1873.

Claim.—The floating steam-scow C^1 C^2 C^3 with hoistways Y^1 Y^2 E E, carriages D^1 D^2, with rollers *e e*, yokes T^1 T^2, with the attachments to hold the scow to the vessel, in connection with steam-engine B, boiler C, and hoisting-rigging Q, substantially constructed as described, and for the purpose as specified.

143,874.—Manufacture of Cast-Iron for Car-Wheels, &c.—Charles Burgess, Portsmouth, Ohio. Application filed September 9, 1873.

Claim.—1. The composite cast-iron herein described, consisting of fined or partially-refined cast-iron and soft-gray cast-iron fused together, substantially as set forth.

2. The combination of a fined or partially-refined cast-iron with a soft-gray cast-iron for the production of chilled castings, or for other purposes.

143,875.—Composing-Stick.—Leopold Buschmann, Newark, N. J., assignor to William Quail, New York, N. Y. Application filed September 4, 1873.

Claim.—The combination, with the angle or knee B of a composing-stick, of an adjustable stop or shoulder, G, to prevent said angle or the back from yielding to the pressure of the type as the lines are composed or justified, substantially as described.

143,876.—Grain-Bag.—William B. Carlock, Wareham, Va., assignor to himself and John Graham, New York city. Application filed March 25, 1873.

At a suitable point near the mouth of the bag a strong cord is inserted, by hand or otherwise, in a shed consisting of a few of the warp-threads, and so woven into the fabric as to effect a secure connection, while at the same time the ends of the cord are left free to serve as tie-strings. To prevent it from slipping lengthwise, a knot is formed on the part of the cord which is incorporated with the fabric.

Claim.—A woven bag having a knotted or bunched string placed under and secured by the warps in the process of weaving, as herein specified.

143,877.—Machine for Shaving Shingles.—Thomas H. Carter, Bremen, Ky. Application filed September 11, 1873.

The shaving-knives are placed in pairs around a circular table and the shingles forced through between them by rotating driving-arms.

Claim.—1. The combination described, with a supporting-table, B, of pairs of knives H, guides F G, spring I, and rotary drivers E, for the purpose specified.

2. The combination, as described, with a radial driver, E, of blades H, set in the direction of chords less than the diameter of the circle in which the driver is rotated, to enable the blades to shave the shingle gradually from butt to point, as specified.

3. The combination, with table B, of a series of knives, H, and a series of drivers, E, the knives and drivers being each at uniform distances apart, but there being a less number of one than the other, as described, so that no two pairs of knives can operate simultaneously, but must act upon their respective shingles at different times.

143,878.—Card-Mount.—James H. Catherson, Philadelphia, Pa. Application filed March 20, 1873.

The card-mount as constructed admits of the picture being readily and accurately centered.

Claim.—1. A card-mount consisting of the rear portion A', having a slot, *s*, for admitting the picture, and the front portion A, which has an opening for the exhibition of the picture, and which conceals the said slot, all as set forth.

2. The said card-mount, having an opening, *c*, for the display of the picture in its front portion, and an opening, *b*, in the rear portion for the adjustment of the picture, as specified.

143,879.—Shaft-Coupling.—RODNEY S. CATHCART, Cincinnati, Ohio. Application filed August 11, 1873.

Claim.—1. The sections A and A, provided with studs *c*, the collar B, the recesses *b*, and the spurs *b'*, in combination with each other and with the shaft ends E, provided with the openings *a*, substantially as and for the purpose specified.

2. The sleeve A, constructed in interlocking sections, as shown, and provided with the studs *a*, the collars C and C, fitted upon or over said sleeve, and the bolts D passing through said collars, combined with each other, and with the shafts E provided with the openings *c*, substantially as and for the purpose set forth.

143,880.—Dressing-Pad.—LOUIS G. CHAPDT, New York, N. Y. Application filed April 3, 1873.

Claim.—1. A self-feeding pad so constructed that a fresh supply of the bronze powder, or other dry coloring matter contained therein, is obtained by a blow or pressure of the pad in the hand of the workman upon the material operated upon, substantially as described.

2. The hollow holder A, combined with the brush-stock B, with or without springs C, substantially as described.

143,881.—Alarm-Clock.—DAVID M. CHARTERS, Xenia, Ohio. Application filed August 29, 1873.

A lamp-lighting apparatus is operated by a suitable arrangement of levers and rods connected with an alarm-clock, or will be operated at any time if a supplementary trip is pulled, by means of either of a number of cords or chains attached thereto, which cord or chain is afterward designated by a collar which is moved thereon.

Claim.—1. The levers *c d*, spring *e*, and rods 9 2, actuated directly by cam *g* and arm of lever *d*, arranged in connection with an alarm mechanism, substantially as and for the purpose set forth.

2. The slotted slide or carriage 4, in combination with the serrated clamp 5, springs 3 and 6, rod 2, and frame 1, constructed and arranged as and for the purpose specified.

3. The lamp *n* and clamp *o*, in combination with the slide or carriage 4, clamp 5, springs 3 and 6, and connecting-rod 9, as and for the purpose herein set forth.

4. The catch 7, in combination with the spring 8, frame 1, rods 2 and 9, when constructed and arranged for operation as and for the purpose set forth.

143,882.—Apparatus for Raising Water.—LORENZO CHASE, Portland, Me., assignor of one-half his right to CHAS. W. CARSON, same place. Application filed September 24, 1873.

Steam is admitted alternately into two air-chambers, forcing the air therefrom through pipes leading to the water-chambers, from which the compressed air forces the water through a discharge-pipe. The air-chambers have valves for the admission of air, and a steam-exhaust valve which is common to both.

Claim.—1. Two or more chambers, provided with suitable openings and apparatus for the automatic and alternate admission of steam and air, in combination with two or more water-chambers provided with ingress and egress openings and valves, substantially as and for the purpose specified.

2. The construction and relative arrangement of the air-chambers A and A', provided with the air-passages H and *a* and steam-ports *d* and E, and the water-chambers I and I', provided with the water-passages *i* and *k*, and discharge-pipes K and L, substantially as and for the purpose shown.

143,883.—Valve for the Waste-Pipes of Sinks.—JOHN CHILCOTT, Brooklyn, N. Y. Application filed April 25, 1873.

Claim.—The oscillating valve B, perforated as described, its perforated segmental seat *s*, the packing C, the central pin or stud F, and the nut N, all combined and organized substantially as described, for the purpose set forth.

143,884.—Water-Ejector.—HUGH COLL, Millvale, Pa. Application filed August 22, 1873.

The receiving-chamber is formed by a diaphragm extending across the lower portion of the shell, and having an opening at the rear end of the steam-nozzle. The discharge-chamber is circular in cross-section, the eccentric portion of the shell being the receiving-chamber.

Claim.—1. A siphon-pump in which the receiving-chamber is formed by means of a diaphragm extending across the lower portion of the shell, such diaphragm forming part of the shell, and having an opening, *c*, at the rear of the steam-nozzle, whereby the water is admitted into the discharge-chamber, substantially as described.

2. The shell *d*, cast in one piece, of a regular spherical form, in cross-section, having a diaphragm, *c*, which, with the upper portion of the shell, forms a circular discharge-chamber, *b*, of smaller diameter, the receiving-chamber *a* being the lower or eccentric portion of the shell, substantially as described.

143,885.—Chalk-Holder for Billiard-Tables.—HUGH W. COLLENDER, New York, N. Y. Application filed August 12, 1873.

Claim.—1. A chalk-box or receptacle for billiard-table, composed of a stationary holder suitably patterned and located, and provided with a cover, which, when closed, forms part of the holder, and covers its contents.

2. A stationary chalk-box provided with an automatically-closing cover or lid, substantially as described.

143,886.—Wagon-Jack.—ALFRED G. COOLEY, Hillsborough, Ohio. Application filed April 3, 1873.

Claim.—The combination of the lever A, bar B, plates C, lugs *c*, and rest D, substantially as and for the purpose set forth.

143,887.—Feeding Device for Middlings-Purifiers.—ROBERT CRAIK, Money Creek, Minn. Application filed March 25, 1873.

Conveyer regulates the feed of the middlings to the stones to be reground.

Claim.—The conveyer G, with a series of secondary flights, *o o*, for feeding the middlings evenly to the pipe P, as herein described.

143,888.—Revolving Shelf.—JOHN DANNER, Canton, Ohio. Application filed September 15, 1873.

A series of shelves are secured to a frame having several sides, which is supported by and turns on a series of flanged wheels which run upon a circular track laid upon the floor.

Claim.—The revolving shelf herein described, and composed of the frame *a b*, shelves *c*, flanged wheels *d*, and circular rail *e*, constructed and arranged to turn or revolve without any central shaft or support, as described and represented.

143,889.—Coffee Substitute.—EDWARD DUGDALE, Griffin, Ga. Application filed October 13, 1873.

Claim.—As a new article of merchandise, the partially-carbonized persimmon (*Diospyros Virginiana*) seed, either reduced to minute particles or entire, as and for the purposes set forth.

143,890.—Coffee Substitute.—EDWARD DUGDALE, Griffin, Ga. Application filed October 13, 1873.

Claim.—The process of separating the seed of the persimmon (*Diospyros Virginiana*) from the pulp or fruity substance, cleansing it, partially carbonizing and fitting it to be reduced to minute particles, or used entire, as the base or constituent element of a beverage, substantially as set forth.

143,891.—Means for Fastening Buttons.—ISAAC F. EATON, Brooklyn, N. Y., assignor to himself and EDWIN BOLITHO, same place. Application filed March 24, 1873.

A button has its shank flattened parallel with its face. The flattened portion is slotted to receive a metallic ribbon, which secures it to a shoe or other article.

Claim.—The combination of the button having its shank flattened parallel, or approximately parallel, to its face, and the metallic ribbon, substantially as and for the purpose herein set forth.

143,892.—Button-Fastening.—ISAAC F. EATON, Brooklyn, N. Y., assignor to himself and EDWIN BOLITHO, same place. Application filed August 4, 1873.

Claim.—The button-fastening composed of a loop or eye on the button, a flat link applied thereto, as described, and a metallic ribbon fitting in a pocket provided in the edge of the shoe or garment to which the button is applied, substantially as herein set forth.

143,893.—Turning-Tool.—JOSEPH W. ELLIS, Camden, N. J. Application filed June 17, 1873.

At the front is an adjustable cutter for reducing the rod to the proper size to enter the bushing, when it is acted upon by two adjustable cutters, one of which can be guided, when required, by a plate, K, having upon it a form or guide engaging with a pin on the cutter-holder, which is made to follow the shape of the groove. The plate K is moved within the stock by connecting it to the head of the lathe.

Claim.—1. The combination and arrangement, substantially as described, of the bushing D and cutters C^1 and C^2 with their adjusting mechanism, consisting of the mandrels G G' and screws H H', as and for the purpose set forth.

2. In combination with the cutter C^1 and mandrel G, the guide-plate K, provided with a screw, L, as and for the purpose set forth.

3. The central shoulder *l* on the end of the mandrel G', for the accurate setting of the cutter C^1, substantially as described.

4. The lever F, in combination with the stock A, cutter C^1, holder G, and form-plate K, substantially as and for the purpose set forth.

5. The combination-tool, constructed substantially as described.

143,894.—Car-Coupling.—JOAB ENCS, Chicago, Ill. Application filed August 7, 1873.

Improvement on patent No. 89,203. The sliding block has a recess on each side, and a stop-bolt passes through the draw-head and the recesses.

Claim.—The sliding block F, having the open recess D L K I and slots H H at the sides of said sliding block, in combination with the bolts T T, extending through the draw-head and said slots, the whole being constructed, arranged, and operated in the manner and for the purpose set forth.

143,895.—Scroll-Sawing Machine.—MICHAEL FOLEY, Appleton, Wis. Application filed June 13, 1873.

Two saws are operated by cranks placed at the opposite ends of a shaft, in such a manner that when one saw is ascending the other is descending, the saws being connected at their upper ends by a band passing over pulleys, and which is strained by an adjustable tightening-pulley.

Claim.—In combination, the hanging frame E, provided with the pulleys K K', slides F, F', and G, the latter having pulley L, lever M, and ratchet N, the bats J, saws O O', slides P P', pitmen V V', and shaft S, provided with crank-wheels T T', constructed and operating substantially as and for the purposes hereinbefore set forth.

143,896.—Steering-Propeller.—FRANK G. FOWLER, Bridgeport, Conn. Application filed November 22, 1870.

Varying the pitch of the propelling-surface of the blade.

Claim.—The curved steering-propeller blade A, in combination with the arms, eccentric, and sleeve of a steering-propeller, substantially as and for the purpose herein set forth.

143,897.—Bag-Holder.—NEWTON A. GREENGER, Coopersburg, Pa. Application filed July 22, 1873.

A bar having a slide and adjustable hinged arms can be applied to any ordinary truck as a bag-holder.

Claim.—The bag-holder, consisting of the bar *b*, slide B, and hinged and adjustable arms *a a'*, constructed and adapted for application to a truck, as set forth.

143,898.—Screw-Cutting Attachment for Lathes.—WILLIAM GLEASON, Rochester, N. Y., assignor of one-half his right to KIDD IRON WORKS COMPANY, same place. Application filed, September 22, 1873.

The pivoted lever B is connected at its lower end to a double rack, into which works a pinion on the shaft that closes the divided nut on the feed-screw of the lathe. The feed-screw of the tool-stock is longitudinally adjusted to withdraw the tool from the work by means of the cam-groove *g* on the face or upper end of lever B operating upon a projection or pin on the sleeve *a* on the feed-screw *b*.

Claim.—1. As an improvement in screw-cutting attachments to lathes, the cam-lever B, in combination with the sliding sleeve *a*, feed-screw *b*, and tool-stock *h*, all acting conjointly, substantially as and for the purposes set forth.

2. The longitudinally-adjustable tool-stock feed-screw *b* and adjusting-cam B, or its equivalent, in combination with the shear-nut N and intermediate mechanism, operating conjointly, substantially in the manner and for the purposes set forth.

143,899.—Machine for Burnishing the Heels of Boots and Shoes.—CHARLES W. GLIDDEN, Lynn, Mass., assignor to JAMES W. BROOKS, trustee, Boston, Mass. Application filed September 3, 1873.

Claim.—1. In combination with a boot or shoe holding mechanism, a series of pivoted rotary burnishers, held against the heel as they pass by the curved edge thereof, and away from said heel as they pass by the breast of the heel.

2. In combination with the burnisher-levers *w*, the ligature spring s^6 and the cam-plate *z*, for actuating the levers, substantially as described.

3. The gas-tube g^6 and jet or flame orifices h^3, in combination with the series of rotary burnishers, arranged and operating substantially as described.

4. The method of burnishing boot and shoe heels, consisting in subjecting the curved heel-edge to the progressive frictional action of a series of burnishers passing over its contour from breast to breast without break.

5. In combination with the rotary burnisher-levers *w*, the stationary cam-plate *z*, substantially as described.

143,900.—Tobacco-Knife.—ISAAC S. GOLDMAN, Winterset, Iowa. Application filed January 18, 1873.

The knife is attached to a lever pivoted centrally, and acts with a fixed upper blade, both blades being detachable for the substitution of other antagonizing tools, a twine ball being arranged in a cavity in the frame immediately over the tool-end, and the loose end passing out through a front perforation or bore.

Claim.—The frame E F B, centrally recessed to receive the lever G, and having a hollow front, B, to receive a ball of twine, and also adapted to hold interchangeably the cutting and pressing tools, as described, the several parts being constructed and arranged as specified.

143,901.—Clothes-Pounder.—SAMUEL F. HAWLEY, Sandy Hill, N. Y., assignor to himself and JAMES M. WHITMOR, same place. Application filed September 6, 1873.

Within a cone-shaped pounder is another of the same form, but much smaller in size, and projecting below it. It is attached to a cylinder that slides on the handle, and has a spiral spring, which allows to yield by pressure and spring back to its place when relieved.

Claim.—The pounder constructed as described, having pounders B and C, rigid stem A, and sliding stem D, and spring E, the smaller being forced upward by a downward stroke, and forced downward by the spring when raised, all arranged for operation as and for the purpose specified.

143,902.—Treadle.—LEOPOLD HEINS, Brunswick, Ga. Application filed October 10, 1873.

The treadles are connected by links to levers, the inner ends of which are pivoted to the frame. To the opposite ends a chain is secured. The chain passes over a grooved pulley secured on the fly-wheel shaft. The pulley, by means of a pawl and ratchet, is locked to the shaft when turned in one direction. To one of the levers is attached a weight. One of the treadles is used to raise the weighted lever, which, in descending, imparts rotary motion to the grooved pulley.

Claim.—1. The combination of the treadles C C', pivoted levers D D', weight J, chain *k*, and wheel or pulley G, all substantially as and for the purposes herein set forth.

2. The combination, with the wheel G, operated by the chain *k* and levers D D', as described, of the ratchet-wheel *f*, pawl *i*, and cog-wheel I, or its equivalent, substantially as and for the purposes herein set forth.

143,903.—Track-Circuit for Electric Railway-Signals.—STEPHEN C. HENDRICKSON, Brooklyn, N. Y. Application filed April 25, 1873.

Connection to rail formed by a copper plate, to which conducting-wire is soldered, bent around rail, and interposed between it and its chair.

Claim.—The metallic plate F, in combination with the rails A or A' of a railroad-track and the conducting-wire or conductor W, substantially as and for the purpose specified.

143,904.—Registering Attachment for Printing-Presses.—ANTON HILDEBRENER, New York, N. Y. Application filed July 31, 1873.

As the bed or platen A moves back and forth on the ways B, the fingers on the shaft C are moved up and down by a pinion on the end of the shaft, gearing with a rack, and thus rocking the shaft.

Claim.—The reciprocating platen A, carrying the shaft C, having one or more pointers, *c d*, and a pinion, *g*, which gears with the rack-bar A, all combined and arranged to operate substantially as described, for the purpose specified.

143,905.—Corn-Planter.—WILLIAM HOUSE, Aurora, Ind. Application filed September 4, 1873.

The dropping-wheel is operated by a pitman connected to an adjustable pin in a rotating disk within the driving-wheel, the disk having notches to engage with a pawl within the wheel, by which motion of the seed-slide is produced only while the machine is moving forward.

Claim.—In combination with the reciprocating seed-slide H A and recessed ground-wheel R r S of a corn-planter, the pitman I, M, rotating disk N *n* O, one or more apertures, P, stud-shaft Q, pawl U, and spring V, when arranged with reference to each other, and adapted to operate in the manner herein explained.

143,906.—Reciprocating Churn.—ABIEL D. HUNTLEY, Smyrna Mills, assignor of one-half his right to BENJAMIN F. NICKERSON, New Limerick, Me. Application filed October 29, 1872.

A bisected dasher-shaft having spiral beaters is detachably secured around a longitudinal driving-shaft within the churn. To the extremities of said shafts are pulleys, over which pass, in opposite directions, belts operated by two treadles. A vertically-adjustable frame is secured to the side of the churn for steadying the operator.

Claim.—1. The longitudinally-bisected sleeve G, provided with spirally-arranged arms *d d*, and held on the shaft *b* by pins and hooks or other equivalent means, substantially as and for the purposes herein set forth.

2. The arrangement, with the shaft *b*, of the belts E E', wheels H H', shaft b^1, straps *f f'*, and treadles J J', all substantially as and for the purposes herein set forth.

3. The up-and-down adjustable frame I, arranged on the box A, as and for the purposes herein set forth.

143,907.—Stench-Trap.—JAMES P. HYDE, New York, N. Y. Application filed March 5, 1873.

The pipe where the followers bear is oval. Two wedge-like pieces project from opposite sides of the pipe and serve to close the corners when the two sides are pressed together.

Claim.—1. The arrangement of an india-rubber or elastic pipe, B, in a suitable casing, when the upper and lower ends of said elastic pipe are circular, and the central part of said pipe is made oval or elliptical in its horizontal section, substantially in the manner and for the purpose set forth.

2. The arrangement of the projecting tongues or pointed lips *c c* in the inside of the central part of the pipe B, substantially as and for the purpose hereinbefore set forth.

143,908.—Pipe-Wrench.—DAVID D. INGHAM, Manistee, Mich. Application filed July 8, 1873.

A serrated block formed to fit within the hooked end of the stationary jaw is pivoted eccentrically thereto.

Claim.—The tool described, having the shank A', with the pivoted eccentric B, and serrated jaw D, combined and arranged as described, for the purpose set forth.

143,909.—Combined Brake and Starter for Street-Cars.—CORNELIUS L. IRVING, Indianapolis, Ind. Application filed April 25, 1873.

To operate the starter the handle must be moved one way; and to operate the brake the handle must be moved the other way.

Claim.—1. The combination of the cone and socket frictional cylinder attached to the front axle, with the spring-pawl and ratchet-cylinder attached to the rear axle, and the elliptic spring, substantially as and for the purpose specified.

2. The combination of the ratchet *r'*, the pawls *r''*, and spiral springs *r'''*, substantially as shown and described.

3. The combination of the elliptic spring *s*, rod *w*, and shifter *p*, with the cone and socket frictional cylinder, substantially as set forth.

143,910.—Fleur-Belt.—Rebecca J. Mortehland, Nevada, Mo., administratrix of Joseph G. Kaufman, deceased. Application filed April 11, 1873.

Belting-reel with interior beaters revolving in the opposite direction from that of the reel.

Claim.—In combination with the bolt B, the wire beater constructed as shown, and revolving in a direction opposite to that of the bolt, substantially as set forth.

143,911.—Cotton-Bale Tie.—Benjamin Kimball, St. Louis, Mo. Application filed October 2, 1873.

The fastening-plate has a rectangular slot cut in one end for the reception of one end of the band, while upon the other end of the plate two lugs are formed, between which the tongues upon the other end of the band are secured.

Claim.—The combination of the plate A, having a slot, *b*, and ears *a a'*, hoop D, provided with one or more tongues, E, constructed for joint operation substantially as and for the purpose shown and specified.

143,912.—Kiln for Drying Lumber.—Stephen R. Kirby, Detroit, Mich., assignor to Jesse Hoyt, New York, N. Y. Application filed August 11, 1873.

An exhaust-steam pipe is arranged in the blast-trunk to heat the air in it. The blast-trunk opens into a kiln on either side by means of branches provided with dampers. The saturated air is admitted to exit-flues by means of valve-plates *b b'*.

Claim.—1. The arrangement of the exhaust-steam pipe C within the blast-trunk F, and with relation to the blast-fan E, tubular heater A, and casing D, substantially as and for the purpose set forth.

2. The combination of the blast-trunk F, the kilns G G, in pairs, the transoms F' F', gates *d d*, flues I, and valve-plates *b' b'*, all constructed and arranged substantially as described and shown, for the purpose set forth.

143,913.—Name-Plate for Stoves.—Philip Klotz, Baltimore, Md., assignor to Bentley C. Bibb, same place. Application filed September 15, 1873.

Claim.—The supplemental plate *a*, attached to a stove and provided with openings *b b*, in combination with the name-plate *d*, having the lugs *c c* on its rear face, substantially as described, and for the purpose set forth.

143,914.—Machine for Compressing and Punching Heel-Blanks.—Richard C. Lambart, Quincy, Mass., assignor to The Shoe-Machinery Manufacturing Company. Application filed September 25, 1873.

The die-opening, into which the heel-blank is pressed, is of the shape of the finished heel, its flaring sides admitting of lateral compression. As the blank is forced down awls perforate it for the reception of nails, which are to secure it to the sole of a boot or shoe.

Claim.—The die-plate *e*, having the flared receptacle *f*, awl-plate *h*, stripper-plate *k*, and follower *n*, when combined and arranged to operate substantially as shown and described.

143,915.—Vapor-Burner.—John C. Love, Philadelphia, Pa. Application filed April 4, 1873.

The tube incasing the valve-stem is drawn out so thin at its lower extremity that it may be compressed by the hollow conical projection forming part of the nut movable upon the tube, and thereby pack the valve-stem. The induction-pipe is placed in close proximity to the vaporizing-chamber, having a notch cut therein to allow play for the air-regulating nut-valve. The nut-valve moves upon the thread of the main tube, which thread also serves for attaching the vaporizing-chamber, and attaching both to regulating-chamber.

Claim.—1. The within-described metallic packing for valve-stems for gas-burners, consisting of a conical tubular projection, *y*, of the valve-casing, embracing the said stem, and arranged to be tightened upon the same by the corresponding conical projections *d d'* of a nut, H, adapted to the threaded exterior of the casing.

2. The tube I, so combined with the other portions of the burner that its single screw-thread *x* shall serve the threefold purpose of securing the same to the valve casing, of receiving the nut-valve K, and of securing the upper portion of the burner to the said tube, all substantially as specified.

3. The combination, substantially as described, of the nut-valve K with the supply-pipe A, recessed at *y* to permit the operation of the said nut-valve.

143,916.—Mold for Fancy Buttons.—Frederick Maass, Newark, N. J. Application filed September 13, 1873.

The mold for a button has a hole through its center, and is provided with radial grooves on its outer surface. A cord is passed through the hole and drawn into the grooves, and the fabric for covering it may thus be secured without sewing.

Claim.—1. The grooves *a'*, formed in the outer surface of the molds A, substantially as herein shown and described.

2. The cords or threads C, in combination with the grooves *a'* of the molds A, for securing the cover B in place upon said molds, substantially as herein shown and described.

143,917.—Machine for Boring and Facing Cylinders.—John MacDonald, Boston, Mass. Application filed June 26, 1873.

The mandrel *a*, chucked to a lathe face-plate, and rotating with it, carries a tool-holder that may be permanently attached to it at any point, to face the end of a surrounding cylinder, or that may be gradually fed along on the mandrel to turn the interior of the cylinder, the tool for the first operation being gradually set out by the feed-screw *d*, co-operating with a worm-wheel keyed to a shaft connected to the cutter, while the translatory movement for effecting the second operation is caused by clamping the feed-screw with a divided nut attached to the cutter-head; the screw being constantly rotated, while revolving, by a pinion keyed upon it whose teeth interlock with those of a stationary gear-wheel.

Claim.—In combination with the cutting-tool, the mechanism, substantially as described and shown, for imparting to it successively revolving and shifting movements and revolving and radial movements, for the purposes set forth.

143,918.—Article of Food from Cider.—Schuyler W. Mahan, Middlebury, Vt., assignor to himself and Charles E. Cardell, same place. Application filed September 22, 1873.

Claim.—A composition of cider, flour, and sugar, subjected to evaporation and clarification by means substantially as set forth.

143,919.—Churn.—John Masten, Lee, Ohio, assignor of one-half his right to J. P. Coe, same place. Application filed June 14, 1873.

Two vertical dasher-rods, each carrying an ascending series of dashers, and each inclined outwardly toward the bottom, so as to move in line with the conical sides of the churn; said rods operated by pitmen connected with bent cranks from a train of gearing, the dashers passing each other in the reciprocal movements of the rods.

Claim.—1. In a churn, the two dasher-rods C C', diverging from each other at their lower ends, and provided with dashers *c*, and operated by alternate up-and-down strokes, substantially as specified.

2. The arrangement of the wheels I G G' with the bent cranks F F', and connecting-rods E E', working in a vertical plane, the fly H, and the double dash-rods C C', all as herein shown and described.

143,920.—Relief-Valve for Fire-Engines.—Alvarado Mayer, Detroit, Mich. Application filed June 3, 1873.

The pressure in the main pipe becoming too great raises a supplemental valve, which in its turn raises a second valve, this last affording exit to the water, the pressure of which upon a piston attached to the relief-valve stem holds the valve to its seat; pressure being removed the relief-valve rises and the water is allowed to escape.

Claim.—The construction and arrangement of the water-way A, cylinders B B^1, cap B^2, stem C, having the passage *b c c'* formed in it, and carrying the relief-valve D, and pistons F F', with relation to the return-pipe E, cylinder G, rod H, valve I, spring J, arm K, and valve L, substantially as and for the purpose set forth.

143,921.—Bosom-Pad.—Helen M. Millar, Louisville, Ky. Application filed July 17, 1873.

Claim.—The extension-pads B B and shoulder-straps C C, in combination with the busts A A, when constructed and arranged substantially as and for the purpose hereinbefore set forth.

143,922.—Manufacture of Asphalt Pipe.—Adolph Müller, Jersey City, N. J. Application filed September 20, 1873.

The sheets of which the pipe is formed are composed of two layers of strips of veneers, at right angles and sewed together.

Claim.—A pipe constructed of strips of wood veneers sewed together in two layers at right angles and coated with asphalt, substantially as and for the purpose specified.

143,923.—Gage-Cock.—Albert A. Murray, Baltimore, Md. Application filed August 15, 1873.

The valve and seat are arranged with openings to correspond with each other, when the valve is rotated about the stem and is provided with a spiral spring around the stem, that yields sufficiently to allow the ready rotation of the valve, and yet holds it in any desired position.

Claim.—The cock-valve A and seat B, the former arranged to rotate about the stem *b*, and having a passage, a^3, in combination with a spiral spring, D, that yields sufficiently to allow readily the rotation of the valve, and yet hold it in any position desired, as and for the purpose described.

143,924.—Filter.—Godfrey S. Neff, Rochester, N. Y. Application filed June 30, 1873.

The reservoir is bottle-shaped, the neck passing through a hole in the center of the water-pan, and constituting the air-pipe.

Claim.—The combination, in a filter, of the reservoir C and water-pan D, made of stone or earthenware, when the reservoir is made bottle-shaped, and its nozzle extends through a central hole in the water-pan and forms the air-pipe, as herein shown and described.

143,925.—Paper-Bag Machine.—James S. Ostrander, Dayton, Ohio. Application filed July 3, 1873.

The rollers *d d'* and *e e'* are located within the header and at a suitable distance from each other, that the feed-rollers may look between them so that they hold the header in place and serve as friction-rolls to the paper-tube. The header is made adjustable by means of interchangeable sides.

Claim.—1. In combination with feed-rollers D D' and knife B, the header E, fitted with rollers *d d' e e'*, and connected and operating substantially in the manner and for the purpose specified.

2. The header E, having interchangeable sides or edges *g*, substantially as and for the purpose specified.

3. The combination of the knife B, header E, fitted with rollers *d d' e e'*, and feed-rollers D D', the roller D' turning in horizontally-adjustable bearings, substantially as and for the purpose specified.

143,926.—Apparatus for Holding Box-Toes for Boots and Shoes.—David H. Packard, North Bridgewater, Mass. Application filed September 26, 1873.

Claim.—1. In an apparatus for forming boxes for the toes of boots and shoes the combination of the block D, having one or more male dies, G, the sliding clasp J, and the female die, formed in two parts, B C, the whole being constructed to operate as and for the purpose set forth.

2. The adjustable gage-plate O, in combination with the male die G, the clamp-plate J, and the female die B C, as and for the purpose set forth.

143,927.—Loom-Shuttle.—Carl L. F. Pfeffferkorn and Wilhelm Auer, Manchester, N. H. Application filed August 20, 1873.

To stop the loom and prevent "float" when an obstruction occurs in the shed, the weft-thread is severed by means of a cutting instrument placed in a case in the side of the shuttle, and consisting of two jaws or blades pivoted together, one of said jaws being operated in one direction by a spring, and in the other by a trigger-lever so placed as to come in contact with a broken warp thread or other obstruction.

Claim.—The movable jaw *c'*, having the extension *d* formed with a curved bearing-surface, in combination with the fixed jaw *c*, the spring *a*, and pivoted lever *b*, all constructed and arranged and confined within the metal case F, as herein shown and described.

143,928.—Apparatus for Treating the Eye.—Merritt F. Potter, Kanesville, Ill. Application filed September 23, 1873.

A column of water, by its own weight, forces a portion through a tube into a cup of proper shape to fit the eye. For water various other liquids may be substituted, and used for bathing the eye.

Claim.—The combination of the cup C for fitting over the eye, flexible tube B, and reservoir A, to form a fountain eye-cup, as set forth.

143,929.—Thill-Coupling.—Joseph M. Pusey, Wilmington, Del. Application filed September 8, 1873.

Claim.—1. The clip B *b b'*, rubber spring D, and thill or pole iron A *a*, in combination with the pin E, having an eccentric part, e^2, and concentric journals *e* and e^1, one of which is of greater, the other of less, diameter than the eccentric part, substantially as and for the purpose specified.

2. In a thill-coupling of the character stated, the eccentric pin E *e* e^1 e^2, provided with a handle, $E' e^3$, in combination with the spring-catch F, substantially as and for the purpose specified.

143,930.—Hobby-Horse.—John Reinhart, New York, N. Y. Application filed August 15, 1873.

Claim.—1. The swinging lever B having an auxiliary brace, E, for supporting the body A, in combination with the shaft C, spring F, and base D, substantially as and for the purpose specified.

2. The elastic braces E, in combination with the swinging lever B, body A, base D, and spring F, arranged to operate substantially as set forth.

143,931.—Spark-Arrester.—Jackson Richards and Jacob Merkel, Philadelphia, Pa. Application filed September 20, 1873.

Claim.—1. The combination and arrangement of the pipes C and E and conical breaker F with the casing of a smoke-stack, substantially as and for the purpose set forth.

2. In combination with the casing A, a breaker and the perforated pipe E, larger at the bottom than at the upper end, for regulating the draft through the space *s*, and also for turning the sparks to the casing A in their descent, to prevent their falling down into the exhaust, substantially as specified.

143,932.—Car-Coupling.—Timothy W. Ryan and Timothy D. Ryan, Matmas City, Ohio. Application filed May 13, 1873.

The slotted coupling-pin is struck by the ball on the opposite draw-head, and thrown back far enough to allow the ball to pass its point.

Claim.—The coupling-pin *d*, having slot A, in combination with the ball *c* and pyramid *e*, substantially as specified.

143,933.—Plumb and Level.—Samuel Sanderson, New Bedford, Mass. Application filed August 9, 1873.

The frame of a pendulum-level has perforated lugs for fitting it upon a spindle of a spinning-machine, in order to adjust the spindle properly.

Claim.—The combination of the graduated and weighted dial A, and the bar B having flanges *a a*, with marks *a' a'* and perforated lugs *b b*, all substantially as and for the purposes herein set forth.

143,934.—Apparatus for Teaching Geography.—Joseph Schindler, Jersey City Heights, N. J. Application filed August 15, 1873.

Two hemispheres attached to a card, above which painted representations of said spheres are shown, to convey to the learner the idea of the globular shape of the earth.

Claim.—A card or plate for teaching geography, provided with the planispheric maps B C, and hemispheric maps B' C', arranged substantially as described.

143,935.—Circuit-Closer for Railroad-Signals.—George H. Snow, West Meriden, Conn. Application filed May 24, 1873.

Beveled end of I, when pushed up by lever B, closes key L. Piston J is attached to I, and slides in cylinder K. Small air-passages connect upper and lower ends of cylinder so that the fall of J is retarded by the slow escape therethrough of the air confined below it, thus keeping circuit closed for some time.

Claim.—1. The combination, with the key-lever L of a circuit-closing instrument, of a piston, J, and cylinder K, substantially as described.

2. The air-cushion formed in the top of the cylinder K by means of the piston J and the passage P, substantially as described.

3. The air-passages O, Q, and P, communicating with the interior of the cylinder K above and below the piston J, in combination with the piston J and key-lever L, substantially as described.

4. The adjustable valve R, which controls the return of the air from the part of the cylinder below the piston to the part above the piston, substantially as described.

5. The combination, with the outer end of the track-lever B, of a spring, E, whereon the track-lever rests, substantially as described.

6. The packing device H, arranged upon the track-lever, so as to close the opening G of chamber F, substantially as described.

143,936.—Rotary Engine.—James C. Spencer, Phelps, N. Y., assignor of two-thirds his right to Jabez K. Babcock, Caseius M. Miller, and Edwd. C. Hoff, same place. Application filed August 26, 1873.

Claim.—1. The combination, in rotary steam-engines, of the shafts B, geared together, and rotary segmental pistons A, with the contractible heads H and H', and shell or case C, for the purposes set forth.

2. The heads H and H', divided vertically, and provided with an intervening adjustable wedge, D, in combination with the segmental pistons A, for the purposes set forth.

143,937.—Bee-Hive.—John H. Stockwell, Bronson, Mich. Application filed September 5, 1873.

The entire body of frames moves out of the case intact, when they may be opened like the leaves of a book; but, when unhooked, the floor beneath them divides into three equal parts, the close back being hinged so as to let its right and left sections fold backward. Each individual frame, being pivoted in rear to the floor and, by a flange, into the top of the back-board, may be lifted independently from its place.

Claim.—1. The honey-frame B made in separate sections, *b*, turning like leaves on, and lifting singly off, the pivots b^3 *d'*, as and for the purpose described.

2. A bee-hive case in sections, A^1 A^2 A^3, the end ones hinged to the middle one at the back, and provided in front with strips D D, that project over a recess, *d*, of the middle one, as and for the purpose set forth.

143,938.—Malt-Steep.—William W. Stoll, Brooklyn, E. D., N. Y. Application filed October 2, 1873.

The elevator-belt runs under a pulley situated in the well and over one or more pulleys on the growing-floor. The doors between the steeps and well are retained in place by lever-braces consisting of two arms having hooks at their ends catching under studs secured in lugs which project from the door-frame and a central pointed rod which bears on the door.

Claim.—The arrangement of an elevator, working in a well, which is situated between two or more malt steeps, and communicates with each of these steeps by one or more apertures in the partition-walls between the steeps and the elevator-well, substantially as shown and described.

143,939.—Evaporating-Pan.—Georgs W. Stoker, Philadelphia, Pa. Application filed September 30, 1873.

The hollow grate-bars are connected by a lateral pipe which receives the circulating liquid before it enters the hollow bars, and acts as a mud-pipe when such a device is needed.

Claim.—1. In combination with the evaporating-pan A, provided within its double bottom with the chamber D, the hollow grate-bars L, and pipes K and M, substantially as and for the purpose specified.

2. In combination with the pan A, hollow grate-bars L, and the pipes K and M, the pipes N, substantially as and for the purpose shown.

143,940.—Manufacture of Paper-Stock.—ALFRED T. STUDEVANT, Mount Pleasant, N. Y. Application filed January 30, 1873.

A set of elastic rubbers, spirally disposed upon a revolving drum, rub the shavings, introduced at one end, against the rough gauze interior lining of the cylinder and feed them out in a disintegrated state.

Claim.—1. The process of reducing wood cuttings, shavings, or fibers to a condition to be worked into paper-pulp by rubbing them over a rough surface or bed by means of elastic rubbers without passing them through such surface or bed, substantially as herein described.

2. The combination of the cylinder A, having a rough lining or surface, and the elastic rubbers C C, arranged as herein described, substantially for the purpose set forth.

143,941.—Harrow.—CHRISTIAN SVENZEN, Blair, Neb. Application filed February 26, 1872.

A series of cylinders having short radial teeth are set in a frame, forming side runners, with cross-bars connecting them at each end, the radial teeth interlocking with each other. A draft-ring is attached to each end, so that the harrow can be drawn in either direction. The runners are rounded off at both ends and upon both sides. The journals being upon one edge the harrow can be reversed to go to and from the field without having the teeth in contact with the ground.

Claim.—The reversible harrow, as described, consisting of the rounded runners and connecting-bars, the toothed cylinders, the seat and removable cover, the cylinders being journaled at the upper edge of the runners to prevent the teeth coming in contact with the ground when reversed.

143,942.—Grading-Level.—JOHN THORNLEY, Charlottesville, Va. Application filed July 21, 1873.

An ordinary spirit-level has arranged vertically at one end an adjustable rack-bar worked by a pinion with milled-headed shaft. The rack-bar has an adjustable extension piece which, when not in use, is contained in a socket in the bar.

Claim.—In combination with the graduated rack-bar D, operated by pinion C, or equivalent, and clamped by screw E, the extension-bar F, arranged to slide in and out of the same, all applied to a level, A, as shown and described, to operate as specified.

143,943.—Fetter for Cows' Tails.—CHARLES F. TOLLES, Nashua, N. H. Application filed July 23, 1873.

Two clamps connected by a chain; one can be applied to the tail of the cow while the other is put upon the tendons of the hind leg. A spring in each clamp forces its jaws together, and they can be held open by means of a bolt operated by the thumb.

Claim.—The apparatus, substantially as described, consisting of the two-jawed clamps A B, their connecting-chain C, actuating-springs D D, and holding mechanism, all arranged and combined substantially in the manner and to operate as specified.

143,944.—Elevator.—OTIS TUFTS, Boston, Mass. Application filed September 3, 1873.

The auxiliary rope is used only when the main check-rope fails to operate. A lever and clamp mechanism is so arranged that, should the car in ascending meet with an obstruction, the clamp will bind the check-rope and stop the car.

Claim.—1. In combination with the car and its check-rope, the auxiliary stop-rope *g*, having its stops *h i* arranged, respectively, above and below the stops *f f* on the rope *e*, substantially as described.

2. In combination with the car a and its check or stop rope, the clamp *k*, arranged to operate substantially as described.

143,945.—Apparatus and Process for Treating Petroleum.—SAMUEL VAN SICKEL, Titusville, Pa. Application filed July 8, 1873.

To separate the gas from petroleum so as to produce only gas and oil, the oil remaining in the still, that which is carried off being condensed in a column, in the lower part of which are steam-pipes, the oil flowing back to the still.

Claim.—1. The process hereinbefore described of treating crude petroleum with the resultant product of only oil and gas, by effecting the condensation of the oleaginous vapors, and the immediate return of the condensed product to the body of oil in the treating-chamber, and carrying over only the uncondensable gases, substantially as set forth.

2. The arrangement of the condensing apparatus described above, the treating-chamber, with a direct communication from the latter through the former, and in suitable position for the direct reflow of the condensed product, substantially as set forth.

3. The combination of a vertical chamber, *f*, for treating crude oil, furnished at or near its lower end with a pipe or pipes for the admission of steam, and a condensing-chamber arranged above, with condensing-pipes for condensing the oily vapors, and a gas-pipe from the dome or chamber above for carrying off the uncondensed gases, substantially as set forth.

4. The combination of the treating-chamber, the condensing apparatus above, the gas-pipe and steam-jet or vacuum apparatus, arranged and combined substantially as set forth.

5. The combination of the treating-chamber *f*, condensing-flues *c*, pipe *h*, condenser *m*, and jet-pipe *l*, arranged substantially as set forth.

6. In combination with the oil-treating and condensing-column *c*, the supply-pipe *g*, the delivery-pipe *p*, and one or more steam-pipes *o*, substantially as described.

143,946.—Construction of Houses.—WILLIAM WARD, New York, N. Y. Application filed May 20, 1873.

Claim.—In a double tenement house, on a single circumscribed lot of ground, the broken wall X X X X X, so constructed, substantially as described, as to apportion off the corresponding space in successive stories to each dwelling alternately, and give to each tenement both front and rear space on each floor, as set forth and shown.

143,947.—Overalls.—EMIL WEIL, New York, N. Y., assignor to STERN & Co., same place. Application filed August 4, 1873.

Short elastic bands are inserted in the waistband in front and provided with a buckle. A flap covers the front opening, and is held in place by one of the elastic bands passing through an opening in it.

Claim.—The overalls A, having band-piece B and flap E *a*, combined with end-buckled elastic bands C, as described, whereby buttons are rendered entirely unnecessary.

143,948.—Car-Starter.—AMOS WHITTEMORE, Cambridgeport, Mass. Application filed June 3, 1873.

Advantage is taken of the momentum of a moving car, in the act of stopping it, to raise one end of the same, so that when the brakes are released the weight of the raised end will operate to start the car forward.

Claim.—1. The lifting-lever D, and its link D′, actuated by the axle C′ through the medium of the rod E, chain F, wheels H H′, and rack-bars J J′, acting on teeth which are on the said axle C′, substantially as described.

2. The eccentric H′ and its winding-up wheel H, acted upon by the axle C′, and an arm, *b*, and rack-bar L, for raising one end of the car-body, substantially as described.

3. The eccentric H′ and its winding-up wheel H, applied to shafts which have their bearings in a longitudinally-movable frame, G, in combination with the lifting-lever D and link D′, and with the rack-rods J J′ and teeth *c c′* on the axle C′, substantially as described.

4. The vertically and rotary movable brake-rods *n* and the tubes *k* with the teeth and notches *v v′*, combined with the rack-bar L, arm *b*, and the eccentric wheel H′ for bringing the winding-up wheel H in contact with the axle C′, for the purpose described.

5. The rack-bars J J′, connected to the bar E and acting on the axle C, substantially as and for the purposes described.

143,949.—Fruit-Drier.—JOHN WILLIAMS, South Haven, Mich. Application filed March 8, 1873.

Claim.—The air-trunk A, having partition B and adjustable openings in its upper part, shafts D D, chain-wheels and endless chain F, frames G, and dampers *b b*, as described.

REISSUE PATENTS.

5,610.—Treating Offal, Flesh, Entrails, &c., for Preservation, Manure, &c.—WILLIAM ADAMSON and CHARLES F. A. SIMONIN, Philadelphia, Pa., assignors to WILLIAM ADAMSON.—Patent No. 119,000, dated September 19, 1871.—Division A. Application filed October 8, 1873.

Claim.—The extraction of animal oils and fats by hydrocarbon vapors in a closed vessel, substantially in the manner described.

5,611.—Drying Offal, Entrails, Flesh, &c., for Preservation, Manure, &c.—WILLIAM ADAMSON and CHARLES F. A. SIMONIN, Philadelphia, Pa., assignors to WILLIAM ADAMSON.—Patent No. 119,000, dated September 19, 1871.—Division B. Application filed October 8, 1873.

Claim.—The process of drying flesh, offal, &c., by subjecting it, in a closed vessel, to hydrocarbon vapors, as set forth.

5,612.—Manure from Offal, Flesh, &c.—WILLIAM ADAMSON and CHARLES F. A. SIMONIN, Philadelphia, Pa., assignors to WILLIAM ADAMSON.—Patent No. 119,000, dated September 19, 1871.—Division C. Application filed October 8, 1873.

Claim.—A manure or manure ingredient consisting of flesh, offal, or other animal matter deprived of its fatty constituents and retaining the ammonia, as set forth.

5,613.—Press.—RICHARD EDMOND, New York, N. Y., assignor to THE UNITED POWER-PRESS COMPANY.—Patent No. 142,220, dated August 26, 1873. Application filed October 10, 1873.

Claim.—1. The stops *c*, mounted on a right-and-left-hand screw-spindle, which acts, by means of toggle-levers, on the follower, said stops being contiguous to the sides of a single standard rising from the follower of a press through the head-block, substantially as and for the purpose specified.

2. The disks *b b*, having projecting hubs mounted loosely upon the endless screw H contiguous to the standard E, and retained in place by stops *c*, in combination with the toggle-levers F, traveling nuts G, and follower D, all constructed and operating as herein shown and described.

5,614.—Furnace.—DAVID HARGER, Des Moines, Iowa.—Patent No. 70,537, dated November 5, 1867. Application filed September 30, 1873.

Claim.—The method of facilitating the combustion of fuel in furnaces by means of a forced blast of air supplied to the furnace through a pipe or duct extending below and crosswise of the grate-bars, and provided with apertures, located opposite the openings between the grate-bars, to direct the several jets of air discharged therefrom to pass obliquely up through the spaces between the grate-bars and traverse the fuel, substantially as hereinbefore shown and set forth.

5,615.—Wagon-Spring.—EDMOND P. MCCARTHY, San Francisco, Cal., assignor to himself and JOHN B. GRANT, same place. Patent No. 90,861, dated June 1, 1869. Application filed September 13, 1873.

Claim.—1. The elastic elliptical spring F, constructed substantially as and for the purposes herein described.

2. The bolt E, having the enlargement H, in combination with the spring F, substantially as and for the purpose set forth.

5,616.—Bale-Tie.—MARY ANN MCCOMB, Memphis, Tenn., administratrix of DAVID MCCOMB, deceased.—Patent No. 15,142, dated June 17, 1856; extended seven years; reissue No. 4,993, dated July 16, 1872. Application filed April 28, 1873.

Claim.—1. In combination with the hooked ends of metallic ties, a slotted link for the purpose of keeping said ends in position, and assisting to prevent the opening of the hooks by the expansive force of the bale, substantially as specified.

2. The method of baling cotton or other like material by means of a slotted link or tie-plate and metallic ties having their ends bent into hooked form, and held in position by said link and the expansive force of the bale, substantially as is shown.

3. The method of baling cotton or other like material by means of metallic ties having their ends of hooked form, substantially as described, so as to permit of their being united by a sidewise motion, as set forth.

5,617.—Cotton-Bale Tie.—JOHN MCMURTRY, Lexington, Ky., assignor to FREDERIC COOK.—Patent No. 58,445, dated October 2, 1866. Application filed June 7, 1873.

Claim.—1. A bale-tie formed by the attachment of one end of a metallic band or strap to the other by looping it into or onto or engaging it with the same, the end thus engaged with the other being confined in position by the expansive force of the bale.

2. A metallic bale-band having one end formed into a plain or half-twist loop for the reception or interlocking of the other, substantially as hereinbefore described.

5,618.—Varnish for Coating Photographic Negatives.—JOHAN WOLFGANG MORGENHEIER, Sheboygan, Wis.—Patent No. 109,833, dated December 6, 1870. Application filed September 15, 1873.

Composition No. 1.—Gum-sandarac, dissolved in absolute alcohol, with turpentine and oil of lavender. Composition No. 2.—Gum-camphor dissolved in alcohol and ether. Mix the two compositions.

Claim.—A varnish for producing a matt or ground glass surface on photographic negatives and glass, compounded substantially as set forth.

5,619.—Explosive Compound.—ALFRED NOBEL, HAMBURG, Germany, assignor, by mesne assignments, to THE GIANT-POWDER COMPANY, San Francisco, Cal.—Patent No. 78,317, dated May 26, 1868. Application filed October 14, 1873.

The explosive substance—nitro-glycerine—and an inexplosive porous substance, such as silicious earth, are brought together to form a composition which is more safe and convenient for transportation, storage, and use.

Claim.—The combination of nitro-glycerine with infusorial earth, or other equivalent absorbent substance, as a new explosive compound.

5,620.—Exploding Nitro-Glycerine.—ALFRED NOBEL, Hamburg, Germany, assignor, by mesne assignments, to THE ATLANTIC GIANT-POWDER COMPANY, San Francisco, Cal.—Patent No. 50,617, dated October 24, 1865; reissue No. 3,378, dated April 13, 1869; reissue No. 4,616, dated March 19, 1872. Application filed October 14, 1873.

Claim.—1. A charge of gunpowder, gun-cotton, or other easily igniting and exploding substance, surrounding a tube or case containing the charge of nitro-glycerine, as a means of exploding the same, substantially as hereinbefore described.

2. The charge of gunpowder, gun-cotton, or other easily igniting and exploding substance, surrounded by a nitro-glycerine charge, and combined therewith as a means of exploding the same, substantially as and for the purpose hereinbefore described.

3. A nitro-glycerine igniter or exploder, consisting of a tube or case inclosing a minute portion of nitro-glycerine, together with lime and water, or other equivalent substances, which, by combining, will evolve the requisite heat to explode the nitro-glycerine therein, substantially as and for the purposes hereinbefore described.

4. An igniter or exploder, consisting of a tube or case containing rocket-powder mixed with a minute portion of nitro-glycerine, and furnished with a fuse or other means of setting fire to the igniting charge, substantially as hereinbefore described.

5. An electric spark, or heat generated by electricity, within the charge of nitro-glycerine, as a means of promoting an impulse of explosion therein, substantially as herein before described.

6. A capsule or percussion-cap furnished with a suitable means of firing or exploding the same, and suitably arranged in relation to the nitro-glycerine, so as, by its detonation, to impart the necessary impulse of explosion thereto, substantially as hereinbefore described.

7. An igniter for producing the explosion of nitro-glycerine, consisting of a case, of wood or other suitable material, for holding the initial explosion-charge, closed with a cork or plug, and a fuse or other means of ignition, substantially as hereinbefore described.

5,621.—Method of Exploding Nitro-Glycerine.—ALFRED NOBEL, Hamburg, Germany, assignor, by mesne assignments, to THE ATLANTIC GIANT-POWDER COMPANY, San Francisco, Cal.—Patent No. 50,617, dated October 24, 1865; reissue No. 3,377, dated April 13, 1869; reissue No. 4, 815, dated March 19, 1872. Application filed October 14, 1873.

Claim.—1. The mode of utilizing nitro-glycerine as an explosive by means of fire, heat, electricity, or an initial explosion communicated to the mass under a condition of confinement, so as to produce an instantaneous explosion of the entire mass, substantially as described.

2. The mode of utilizing nitro-glycerine as an explosive by means of effecting an impulse of explosion by the detonation of an explosive substance communicated to the mass under a condition, so as to produce an instantaneous explosion of the whole mass, substantially as described.

5,622.—Electric Signaling Apparatus for Railroads.—FRANK L. POPE, Elizabeth, N. J., assignor to himself, STEPHEN C. HENDRICKSON, Brooklyn, N. Y., and JAMES N. ASHLEY and JAMES D. LINCOLN, Greenville, N. J.—Patent No. 129,425, dated July 16, 1872. Application filed May 28, 1873.

System of semaphoric and block signaling, wherein the rails form part of the circuit.

Claim.—1. The arrangement of the ends of two abutting rails of a railroad-track on separate chairs or supports upon a sleeper, whereby metallic contact between the said rails is prevented and the extent of an electrical circuit limited, substantially as and for the purpose herein specified.

2. The combination of a stationary alarm or audible signal, an electro magnet or magnets, a battery, and one or more rails of an insulated section of railroad-track, so arranged relatively to each other that, so soon as a metallic connection is formed between the said rails, as by the axle and wheels of a locomotive or car, the mechanism which actuates the alarm will be caused to operate, substantially as described.

3. The combination of a visual or semaphoric signal, an electro magnet or magnets, a battery, and one or more rails of an insulated section of a railroad-track, so arranged relatively to each other that, as soon as a metallic connection is formed between the said rails, as by the wheels of a locomotive or car, the said signal will be moved, substantially as specified.

4. The combination of the following elements: A visual or semaphoric signal, *L′*, an audible or sounding signal, Q, both under the control of one or more electro-magnets, a battery, and an electrical circuit composed in part of wire and in part of one or more rails of an insulated section of railroad-track, substantially as specified.

5. The combination of the following elements: A visual or semaphoric signal, moved in one direction by one or more electro-magnets and in the other direction by a spring or its equivalent, a suitable mechanism for multiplying the motion derived from the armature of the said electro magnet or magnets interposed between said armature or armatures and the signal, and an electrical circuit composed in part of one or more rails of an insulated section of a railroad-track, substantially in the manner and for the purpose herein specified.

6. The combination of the circuit-closer *m n* with the electrical circuit 4 5 6 H H′ G, substantially as and for the purpose herein specified.

7. The combination, with an insulated rail, which, in conjunction with wires or conductors connected thereto, forms part of an electric circuit, and an adjacent insulated or uninsulated rail of a railroad-track, and a parallel fish bar or bars provided with bolts passing through such bars or rails, of a suitable intervening or interposed non-conducting material, whereby the insulation between said adjacent rails is maintained, and the extent of an electrical circuit, formed in part of one or more rails of a railroad-track, thereby limited, substantially as set forth.

8. The combination of a suitable insulating material, *q*, with the bolts *p p*, whereby the said bolts are insulated from the rails R R′ or from the insulated fish-plates *s s*, substantially as and for the purpose herein specified.

9. The combination with the electrical circuit, composed of wires and the ordinary rails of a railroad-track, and the axles and wheels of a railroad-train, of an electro-motor for operating a signal or alarm, substantially as and for the purpose herein specified.

10. An electro-motor composed of the stationary magnets S S and S′ S′, the revolving magnets T T and T′ T′, and the commutators X and X′, when said two revolving magnets, and also the two commutators, are arranged at right angles to each other, whereby an audible alarm may be operated, without interfering with the action of a magnet, which serves to actuate a semaphoric or visual signal included in the same circuit.

5,623.—Dental Instrument.—Ira A. Salmon, Boston, Mass.

Patent No. 62,504, dated February 26, 1867. Application filed October 11, 1873.

This dental plugger is so arranged that blows are struck when one end is forced against the filling to be compacted, and also when a pull is given with a hooked point attached to the other end. The trip and incline, as well as the hammer and spring, can all be slid out from the outer case, with their relative positions unaltered.

Claim.—1. A combination composed of the hook, or its equivalent, the spindle, the hammer, and mechanism, substantially as described, or its equivalent, for operating such hammer, as and for the purpose set forth.

2. The combination as well as the arrangement of the direct-pressure and back-action pluggers with the hammer, its case, and mechanism for operating such hammer, substantially as and for the purpose specified.

3. The construction and arrangement of the trip *l*, spring-catch *p*, shoulder *h*, hammer *a*, spindle *B*, and incline *m*, permitting the case covering them to be removed without disturbing their relative positions, and this independent of the back-action plugger, substantially as set forth.

5,624.—Machine for Manufacturing Auger-Bits.—James Swan, Seymour, Conn., assignor to Richard P. Bruff.

Patent No. 78,709, dated June 9, 1868; reissue No. 4,516, dated August 15, 1871. Application filed July 24, 1873.

Claim.—1. The combination of clamping-jaws, having dies formed to receive the screw-thread of an auger, with a rotative die for upsetting the auger lips, the jaws and die acting in conjunction to draw the lips, and the combination being substantially as shown and described.

2. The described method of forming or drawing the lips of augers, the auger-blank being first clamped in jaws formed to receive the auger-screw, (the lips extending beyond the jaws,) and the lips being then upset and drawn against the ends of the jaws by the rotative and forward action of a die, the ends of the jaws being formed to shape the lips under the action of the die.

3. The combination of the clamping-jaws B and the stationary or female dies formed therein; the die J, to operate in conjunction with said stationary dies, to bend, compress, and draw the lips of the blank; mechanism to impart to die J reciprocating rotary movements upon its axis; mechanism to force said die J gradually and rectilinearly up to and against the auger-bit, and the spring, or its equivalent, to suddenly force said die away from said bit, the combination being such as to effect the operations here ascribed to it, in the manner substantially as hereinbefore described.

4. The combination of the arbor H and supporting and guiding frame, mechanism to impart to said arbor a rectilinear and also a rotary movement, the spring I, arranged as described, to impart to said arbor reciprocal rectilinear and rotary movements in opposite directions, the die J, the clamping-jaws B, and the stationary or female bit-swaging dies upon or within said jaws B.

5. The combination of cam N, rotating wheel K having vertical pin *d*, arbor H having horizontal pin *e*, the hub *d'* having pin *f*, and the hollow standard G having pin *g*, all arranged substantially as described, to turn the stock *d'* exactly one quadrant of a circle, and no more.

5,625.—Shutter-Fastening.—Benjamin D. Washburn, Boston, Mass.—Patent No. 94,363, dated August 31, 1869. Application filed July 26, 1873.

The ends of the screw-case are projected, and in the projections are slots to pass over the ends of the catch, so that said catch may not be twisted while screwing the case into the blind. The slots in the case at each end also extend laterally for a short distance in the sides of the case.

Claim.—1. The combination, with the catch-piece, of the screw-threaded shell or case, provided with slots 3 and 4 formed in the sides and lengthwise of the shell, at the respective ends thereof, substantially as and for the purposes described.

2. The screw-threaded shell or case, having recessed projecting lips B C, in combination with the catch-piece, substantially as and for the purposes set forth.

3. The combination, with the shell or case A, provided with the external screw-thread *a* and lips B and C, of the catch part D and operating-spring, substantially as and for the purposes set forth.

5,626.—Machine for Crozing and Chamfering Staves.

Henry Welds, Newark, N. J., assignor to Edward Holmes and Britain Holmes, Buffalo, N. Y.—Patent No. 36,186, dated August 12, 1862. Application filed May 29, 1873.

The barrel is placed in two revolving chucks, and the ends of the staves crozed and chamfered by rotating cutters provided with suitable cutting-tools.

Claim.—1. In a barrel crozing and chamfering machine, the combination, with the revolving ring or chuck H, which receives and holds the stave-cylinder, of a driving-wheel engaging with the periphery of the revolving ring, and imparting motion thereto for rotating the stave-cylinder, all constructed and arranged substantially as hereinbefore set forth.

2. The combination, with the revolving ring or chuck and driving-wheel, of the bearing D, surrounding and protecting the same from chips and dirt, substantially as hereinbefore set forth.

3. The combination, with the revolving rings H, of the relatively stationary guides N, for facilitating the chucking of the stave-cylinder, substantially as hereinbefore set forth.

4. The combination, in a barrel crozing and chamfering machine, with the longitudinally-adjustable bed-plate and bearing for the revolving ring or chuck receiving thereto, of the bearings C C of the shaft of the cutter-head, made transversely adjustable on said bed-plate, substantially as hereinbefore set forth.

5. The combination, with the revolving ring or chuck which holds the stave-cylinder, of the driving-wheel and adjustable bearing for the shaft of the latter, by which said driving-wheel is thrown in and out of gear simultaneously with movement of the cutter-bearings, substantially as hereinbefore set forth.

6. The combination, with bed-plate B, revolving ring H, and bearings C D, of the driving wheel and shaft (*f*, arm *l P*, and connecting-link *l*, by which the wheel *i* is adjusted simultaneously with the cutter-head, substantially as hereinbefore set forth.

7. The combination, with the bed-plate B and bearings C C, of the cutter-shaft, the lever *c*, link *c'*, and spring-catch P, substantially as hereinbefore set forth.

INDEX OF INVENTIONS PATENTED OCT. 21, 1873.

	Class No.	Whole No.
Auger bits, machine for the manufacture of, J. Swan, (reissue)	29	5,624
Bag, grain, W. B. Carlock	57	143,676
Bag holder, N. A. Gaisinger	57	143,697
Bale tie, D. McComb, (reissue)	7	5,616
Bale tie, cotton, B. Kimball	7	143,911
Bale tie, cotton, J. McMurtry, (reissue)	7	5,617
Band, endless, L. Binns	81	143,749
Barrels with glue, lining oil, E. W. Leggett	48	143,770
Bed, spring, Smith and Gill	68	143,854
Bee hive, J. H. Stockwell	9	143,937
Billiard tables, chalk holder for, H. W. Collender	143	143,685
Boat for trains of cars, ferry, F. Case	137	143,606
Boiler, wash, Truesdell and Curtis	91	143,796
Boots and shoes, apparatus for molding box toes for, D. H. Packard	16	143,926
Boots and shoes, machine for burnishing the heels of, C. W. Glidden	16	143,899
Boots and shoes, jack for nailing, &c., J. G. Rose	16	143,786
Bosom pad, H. M. Miller	36	143,921
Bottle, sample, S. H. Gilman	161	143,753
Brick machine, J. D. Bush	20	143,806
Bridge, chain suspension, E. W. and R. W. Serrell, Jr.	21	143,788
Bronzing pad, L. G. Chaput	54	143,860
Building block, F. W. Colby	20	143,809
Burner, vapor, J. C. Love	20	143,915
Button fastening, I. F. Eaton	23	143,892
Buttons, mode of fastening, I. F. Eaton	23	143,891
Buttons, mold for fancy, F. Maase	23	143,916
Can, oil, W. G. Cowell	107	143,910
Car axle box, W. B. Howe	122	143,763
Car coupling, J. Enos	122	143,694
Car coupling, F. A. Fleming	122	143,752
Car coupling, J. Gum	122	143,756
Car coupling, R. Lloyd	122	143,828
Car coupling, T. W. and T. D. Ryan	122	143,832
Car coupling, P. Swinesford	122	143,791
Car starter, B. F. Oakes	122	143,837
Car starter, A. Whittemore	122	143,948
Cars, combined brake and starter for street, C. L. Irving	122	143,909
Cars, dumping platform for railroad, J. W. Harrison	122	143,758
Cars, ferry boat for trains of, F. Case	137	143,606
Carbonates, manufacture of alkaline, H. D. Grouailliers	35	143,755
Card mount, J. H. Caterson	146	143,678
Carpet fastener, B. D. Kested	62	143,784
Carriage, child's, A. F. R. Arndt	31	143,803
Carriage, child's, T. Galt	31	143,818
Churn, J. Masten	45	143,919
Churn, reciprocating, A. D. Huntley	45	143,906
Churn, reciprocating, E. T. Wheeler	45	143,800
Clock, alarm, D. M. Chartiers	36	143,681
Clock, electric, F. J. Ritchie	36	143,947
Clothes pounder, S. F. Hawley	81	143,901
Coal breaker, H. Bradford	3	143,745
Cock, gage, A. A. Murray	146	143,923
Coffee substitute, E. Dugdale	35	143,689
Coffee substitute, E. Dugdale	35	143,690
Coffin fastening, W. S. Crane	39	143,748
Collodion compound, J. A. McClelland	35	143,773
Cooler, milk, J. Pearl	45	143,840
Corn husker, J. Ure	75	143,797
Cotton for the manufacture of collodion, preparing soluble, H. T. Anthony	26	143,865
Cows' tails, fetter for, C. F. Tolles	144	143,943
Cylinders, machine for boring and facing, J. MacDonald	106	143,917
Dental instrument, I. A. Salmon, (reissue)	62	5,623
Desk, school, C. J. Higgins	68	143,760
Ejector, water, H. Coll	116	143,884
Electric signaling apparatus for railroads, F. L. Pope, (reissue)	50	5,622
Elevator, O. Tufts	79	143,944
Embroidery patterns, apparatus for transferring, C. Bordas	54	143,872
Engine, reciprocating, S. J. Jones	130	143,907
Engine relief valve, Ira A. Mayer	118	143,920
Engine, rotary, J. C. Spencer	150	143,938
Engine, steam fire, W. C. Davol, Jr	150	143,750
Engine, steam pumping, W. C. Hicks	150	143,894
Engine valve, steam, A. Carr	152	143,897
Evaporating pan, G. W. Storer	89	143,939
Explosive compound, A. Nobel, (reissue)	124	5,619
Eye, apparatus for treating the, M. F. Potter	156	143,929
Faucet, measuring, J. Schalk, Jr	132	143,950
Filter, G. S. Neff	167	143,924
Filter for oils, acids, &c., J. Jowitt	47	143,788
Fire arm, revolving, W. S. Smoot	123	143,835
Fire extinguisher, anti-freezing, W. C. Brunon	35	143,748
Fire extinguisher, automatic, I. P. Tice	35	143,794
Flour bolt, W. Gosshorn	57	143,891
Flour bolt, J. G. Kaufman	57	143,910
Food from cider, articles of, S. W. Mahan	58	143,918
Fork, horse hay, A. J. Mellis	77	143,775
Fruit drier, J. Williams	48	143,949
Furnace, D. Harger, (reissue)	149	5,614
Furnace, hot air, C. J. Shepard	154	143,851
Game apparatus, West and Lee	143	143,799
Gasalier extension, L. Hull	64	143,765
Gate, automatic, Olbert and Young	58	143,839
Generator, sectional steam, D. Renshaw	148	143,842
Generator, sectional steam, D. Renshaw	148	143,843
Generator, sectional steam, D. Renshaw	148	143,844
Generator, sectional steam, D. Renshaw	148	143,845
Glass articles, forming orifices and necks on, J. Wing	66	143,863
Glassware, manufacture of stemmed, J. Oesterling	66	143,778
Grate, S. Smyth	154	143,856
Harness mounting, T. Fawcett	72	143,617
Harrow, C. Svensen	73	143,941
Hat frames, machine for forming, Ertola and Caselli	76	143,814
Heating drum, I. P. Tice	154	143,795
Heel blanks, machine for compressing and pushing, R. C. Lambert	16	143,914
Hinge, gate, W. Hull	24	143,764
Hobby horse, J. Reinhart	143	143,930
Horseshoe machine, C. H. Perkins	60	143,781
Horseshoe machine, C. H. Perkins	60	143,782
Houses, construction of, W. Ward	4	143,946
Hubs to shafts, securing wheel, E. Sanford	87	143,940
Ice cream freezer, M. F. Graves	58	143,892
Iron, apparatus for puddling, J. Davies	85	143,811
Iron for car wheels, &c., manufacture of cast, C. Burgess	85	143,874
Kiln for drying lumber, S. R. Kirby	48	143,912
Knife polisher and sharpener, T. Bootsman	88	143,871
Lamp fountains, mold for glass, J. Wing	66	143,864
Lathes, screw cutting attachment for, W. Gleason	100	143,898
Leather, machine for crimping and folding, Platts and Walden	92	143,763
Leather, machine for scouring, glossing, or setting, F. A. Lockwood	92	143,939
Level, grading, J. Thornley	157	143,942
Lightning rod, J. J. White	50	143,682
Lock, seal, D. K. Miller	93	143,927
Loom shuttle, Pfefferkorn and Aust	95	143,927
Lumber marker, W. Merritt	99	143,773
Malt steep, W. W. Stoll	19	143,938
Manure from offal, flesh, &c., Adamson and Simonin, (reissue)	96	5,612
Mill, grinding, J. G. Baker	57	143,967
Mill, grinding, P. Evans	57	143,616
Mower, lawn, W. Sallers	75	143,787
Navigation of canals, &c., keeping open the, J. Mullaly	82	143,853
Nitro glycerine, exploding, A. Nobel, (reissue)	124	5,620
Nitro glycerine, method of exploding, A. Nobel, (reissue)	124	5,621
Offal, entrails, flesh, &c., for preservation, manure, &c., drying, Adamson and Simonin, (reissue)	96	5,611
Offal, flesh, entrails, &c., for preservation, manure, &c., treating, Adamson and Simonin, (reissue)	96	5,610
Overalls, E. Well	38	143,947
Paint compound, J. Quarterman	107	143,841
Pantaloons, E. T. Taylor	38	143,792
Paper bag machine, J. S. Ostrander	109	143,935
Paper feeding machine, J. T. and F. Ashley	117	143,749
Paper machines, dandy roller for, J. Whitehead	106	143,801
Paper stock, manufacture of, A. T. Sturdevant	106	143,940
Pen and pencil case, C. H. Streightoff	146	143,859
Petroleum, apparatus and process for treating, S. Van Syckel	47	143,945
Photograph negatives, varnish for coating, J. W. Morgeneier, (reissue)	111	5,618
Piano, grand, G. Steck	112	143,789
Picture frame, Warren and Adderly	54	143,861
Pipe, machine for making earthenware, J. Bingham	20	143,870
Pipe, manufacture of asphalt, A. Muller	107	143,929
Planter, corn, W. House	133	143,905
Planter, corn, C. Hutchins	133	143,888
Planter and fertilizer distributer, seed, B. Montfort	133	143,926
Plumb and level, S. Sanderson	97	143,933
Press, E. Esmond, (reissue)	7	5,613
Printing press, card and ticket, G. E. Peck	117	143,780
Printing presses, registering attachment for, A. Hilgenreiner	117	143,904
Propeller, endless chain, T. Teed	139	143,793
Propeller, steering, F. G. Fowler	139	143,686
Pulley, lubricating, J. K. McLanahan	87	143,820
Pump, J. Edson	118	143,751
Pump, A. L. Hatfield	118	143,759
Pump, S. Lane, Jr	118	143,769
Purifiers, feeding device for middlings, R. Cmalk	57	143,627
Railroad rail joint fastening, G. A. Sturgis	139	143,789
Railroad signal, automatic, H. S. Evans	139	143,615
Railroad signals, circuit closer for, G. H. Snow	50	143,935
Railroad signals, track circuit for electric, S. C. Hendrickson	50	143,900
Railroad trains, smoke and spark conduit for, T. De Codesco	94	143,915
Railroads, electric signaling apparatus for, F. L. Pope, (reissue)	50	5,622
Range, cooking, W. Hopkins, Jr	154	143,766
Rein, check, G. J. Townley	73	143,792
Sewing machine, scroll, M. Foley	130	143,695
Sewing machine, G. W. Hunter	134	143,768
Sewing machine table, J. Benner	134	143,742
Sewing machine tuck creaser, S. P. Babcock	134	143,741
Shaft coupling, R. S. Cathcart	87	143,679
Shelf, revolving, J. Danner	68	143,682
Shingles, machine for shaving, T. H. Carter	173	143,677
Shoe gores, machine for gumming the edges of elastic, Walden and Platts	16	143,793
Shutter fastening, J. P. Bush	24	143,695
Shutter fastening, B. D. Washburn, (reissue)	24	5,625
Sinks, valve for the waste pipes of, J. Chilcott	8	143,909
Slate, office, C. Boyle	146	143,894
Smoke and spark conduit for railroad trains, T. De Codesco	94	143,915
Snow, machine for melting, J. Mullaly	138	143,854
Soda water, &c., draft cock for, J. D. O'Donnell	1	143,777
Sole edge trimming, implement for, A. P. Hazard	16	143,761
Spark arrester, Richards and Meehl	94	143,931
Spindle bolster, G. Richardson	87	143,785
Staves, machine for crozing and chamfering, H. Wilde, (reissue)	40	5,626
Steam trap, J. W. Hodges	159	143,761
Stick, composing, L. Buschmann	117	143,678
Stools, tables, &c., standard for, S. H. Newcomb	62	143,693
Stove pipe thimble, T. D. Slauson	154	143,853
Stoves, name plate for, P. Klotz	154	143,913
Street sweeping machine, L. J. O'Connor	110	143,933
Sugar and sirups, apparatus for refining, S. H. Gilman	155	143,754
Superheater, D. Renshaw	148	143,846
Teaching geography, apparatus for, J. Schedler	148	143,934
Tenoning machine, W. M. Sack	173	143,849
Thill coupling, J. M. Pusey	31	143,930
Timber, and loading vessels therewith, raising floating, A. Bulman	82	143,873
Tobacco knife, I. S. Goldman	149	143,900
Toy block for object teaching, N. Muller	148	143,924
Trap, sewer inlet, G. R. Moore	8	143,774
Trap, stench, J. P. Hyse	8	143,907
Treadle, L. Heins	67	143,908
Truck for carrying bricks, R. A. Smith	31	143,852
Turning tool, J. W. Ellis	100	143,683
Valve, alarm safety, F. Steele	148	143,698
Valve, safety, J. Hoffman	158	143,905
Valve mechanism, slide, E. E. Gilbert	152	143,819
Vehicle wheel, D. Dimmick	31	143,813
Vehicle wheel, J. H. Glover	31	143,889
Vehicle wheel, J. O'Connor	31	143,776
Ventilator for buildings, G. R. Barker	146	143,893
Wagon brake, W. P. Buckner	31	143,747
Wagon jack, A. G. Cooley	31	143,698
Wagon spring, D. A. Boyle	31	143,744
Wagon spring, E. P. McCarthy, (reissue)	31	5,615
Washing machine, J. Bennett	91	143,889
Washing machine, G. G. Curtiss	91	143,749
Washing machine, N. J. Parsons	91	143,779
Watchmaker's staking tool, J. Stark	36	143,857
Water, apparatus for raising, L. Chase	116	143,682
Wax mold, sealing, I. L. Baker	20	143,668
Wax package, sealing, W. J. Lumb	146	143,771
Weights, apparatus for lowering, T. Wrightson	79	143,802
Wheelbarrow, J. M. and J. L. Jones	31	143,787
Wrench for bung bushings, G. W. Harris	109	143,757
Wrench, pipe, D. D. Ingram	163	143,909

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED OCT. 21, 1873.

Adamson, W., and C. F. A. Simonin, Treating offal, flesh, entrails, &c., for preservation, manure, &c., (Div. A,) (reissue)	5,610
Adamson, W., and C. F. A. Simonin, Drying offal, entrails, flesh, &c., for preservation, manure, &c. (Div. B,) (reissue)	5,611
Adamson, W., and C. F. A. Simonin, Manure from offal, flesh, &c., (Div. C,) (reissue)	5,612
Adderly and Warren	143,861
Anthony, E. and H. T., & Co., assignees	143,695
Anthony, H. T., Preparing soluble cotton for the manufacture of collodion	143,695
Arndt, A. F. R., Child's carriage	143,803
Ashley, J. N., assignee, (reissue)	5,623
Ashley, J. T. and F., Paper feeding machine	143,749
Atlantic Giant Powder Company, assignees, (reissue)	5,624
Aust and Pfefferkorn	143,927

Babcock, J. K., assignee 143,936
Babcock, S. P., Sewing machine tuck creaser 143,741
Baker, H. M., assignee 143,766
Baker, I. L., Mold for sealing wax 143,866
Baker, J. G., Grinding mill 143,867
Barker, G. E., Ventilator for buildings 143,868
Bennett, J., Washing machine 143,869
Benner, J., Sewing machine table 143,742
Bibb, E. C., assignee 143,913
Bingham, J., Machine for making earthenware pipe 143,870
Binns, L., Endless band 143,743
Bolitho, R., assignee 143,891, 143,892
Bostman, T., Knife polisher and sharpener 143,871
Bordas, C., Apparatus for transferring embroidery patterns 143,872
Boyle, C., Office slate 143,804
Boyle, D. A., Wagon spring 143,744
Bradford, H., Coal breaker 143,745
Brooks J. W., trustee, assignee 143,899
Bruff, R. P., assignee, (reissue) 5,624
Brusun, W. C., Anti-freezing fire extinguisher 143,746
Buckner, W. P., Wagon brake 143,747
Bulman, A., Means of raising floating timber, and loading vessels therewith 143,873
Burgess, C., Manufacture of cast iron for car wheels, &c. 143,874
Buschmann, L., Composing stick 143,875
Bush, J. D., Brick machine 143,876
Bush, J. P., Shutter fastening 143,805
Cahoon, C. W., assignee 143,862
Cardall, C. E., assignee 143,918
Carlock, W. R., Grain bag 143,876
Carnell, F. L. and D. R., assignees 143,870
Carr, A., Steam engine valve 143,807
Carter, T. H., Machine for shaving shingles 143,877
Caselli and Ertola 143,814
Case, F., Ferry boat for trains of cars 143,808
Catterson, J. H., Card mount 143,878
Cathcart, R. R., Shaft coupling 143,879
Chandler, L. H., assignee 143,793
Chapot, L. G., Breasing pad 143,880
Charters, D. M., Alarm clock 143,881
Chase, L., Apparatus for raising water 143,882
Chilcott, J., Valve for the waste pipes of sinks 143,883
Coe, J. P., assignee 143,919
Colby, F. W., Building block 143,809
Coll, H., Water ejector 143,884
Collender, H. W., Chalk holder for billiard tables 143,885
Cook, F., assignee, (reissue) 5,617
Cooley, A. G., Wagon jack 143,886
Cowell, W. G., Oil can 143,810
Crafts, R., Feeding device for middlings purifiers 143,887
Crane, W. S., Coffin fastening 143,746
Culver, C. P., assignee 143,793
Cumbs and Truesdell 143,796
Curtiss, G. G., Washing machine 143,749
Danner, J., Revolving shelf 143,888
Davies, J., Apparatus for puddling iron 143,811
Devol, W. C., Jr., Steam fire engine 143,750
De Codesco, T., Smoke and spark conduit for railroad trains 143,819
Dimmick, D., Vehicle wheel 143,813
Doolin, W., assignee 143,803
Dugdale, E., Coffee substitute 143,889
Dugdale, E., Coffee substitute 143,890
Eaton, I. F., Fastening buttons 143,891
Eaton, I. F., Button fastening 143,892
Edson, J., Pump 143,751
Ellis, J. W., Turning tool 143,893
Ence, J., Car coupling 143,894
Enterprise Manufacturing Company, assignee 143,867
Ertola, B., and A. Caselli, Machine for forming hat frames 143,814
Esmond, R., Press, (reissue) 5,613
Evans, H. S., Automatic railroad signal 143,815
Evans, P., Grinding mill 143,816
Fawcett, T., Harness mounting 143,817
Fleming, F. A., Car coupling 143,752
Foley, M., Scroll sawing machine 143,895
Fowler, F. G., Steering propeller 143,896
Galt, T., Child's carriage 143,818
Geisinger, H. A., Bag holder 143,897
Giant Powder Company, assignee, (reissue) 5,619, 5,620, 5,621
Gilbert, E. E., Slide valve mechanism 143,819
Gill and Smith 143,854
Gillette, G. W., assignee 143,757
Gilman, S. H., Sample bottle 143,753
Gilman, S. H., Apparatus for redning sugar and sirups 143,754
Gleason, W., Screw cutting attachment for lathes 143,898
Gliddon, C. W., Machine for burnishing boot and shoe heels 143,899
Glover, J. H., Vehicle wheel 143,820
Goldman, I. S., Tobacco knife 143,900
Gossberg, W., Flour bolt 143,821
Graham, J., assignee 143,876
Grant, J. R., assignee, (reissue) 5,615
Graves, M. P., Ice cream freezer 143,822
Groesilliers, H. D., Manufacture of alkaline carbonates 143,755
Gum, J., Car coupling 143,756
Harger, D., Furnace, (reissue) 5,614
Harris, G. W., Wrench for bung bushes 143,757
Harrison, J. W., Railroad car dumping platform 143,758
Harway, J. W., assignee 143,761
Hatfield, A. L., Pump 143,759
Hawley, S. F., Clothes pounder 143,901
Hazard, A. P., Implement for sole edge trimming 143,823
Heine, L., Treadle 143,902
Hendrickson, S. C., assignee, (reissue) 5,622
Hendrickson, S. C., Track circuit for electric railway signals 143,903
Hicks, W. C., Steam pumping engine 143,824
Higgins, C. J., School desk 143,760
Hilgenreiner, A., Printing press registering attachment 143,904
Hodges, J. W., Steam trap 143,761
Hoff, E. C., assignee 143,936
Hoffman, J., Safety valve 143,825
Holmes, E. and R., assignees, (reissue) 5,626
Hopkins, W., Jr., Cooking range 143,762
House, W., Corn planter 143,905
Howe, W. B., Car axle box 143,763
Hoyt, J., assignee 143,912
Hull, L., Gasalier extension 143,765
Hull, W., Gate hinge 143,764
Hunter, G. W., Sewing machine 143,766
Huntley, A. D., Reciprocating churn 143,906
Hutchins, C., Corn planter 143,826
Hyde, J. P., Stench trap 143,907
Ingersoll, A. M., assignee 143,841
Ingram, D. D., Pipe wrench 143,908
Irving, C. L., Combined brake and starter for street cars 143,909
Jewell, H. S. and E. M., assignees 143,858
Jones, J. M. and J. L., Wheelbarrow 143,767
Jones, S. J., Reciprocating engine 143,827
Jowitt, J., Filter for oils, acids, &c 143,768
Kane, F., assignee 143,756
Kaufman, J. G., Flour bolt 143,910
Kested, B. D., Carpet fastener 143,784
Kidd Iron Works Company 143,898
Kimball, B., Cotton bale tie 143,911
Kirby, S. R., Kiln for drying lumber 143,912
Klotz, P., Name plate for stoves 143,913
Lambart, R. C., Machine for compressing and punching heel blanks 143,914
Lane, S., Jr., Pump 143,769
Large, A., assignee 143,826
Lee and West 143,799
Leggett, E. W., Lining oil barrels with glue 143,770
Lincoln, J. D, assignee, (reissue) 5,622
Lloyd, R., Car coupling 143,828
Lockwood, F. A., Machine for scouring, glossing, or setting leather 143,829
Love, J. C., Vapor burner 143,915
Lumb, W. J., Sealing wax package 143,771
Maase, F., Mold for fancy buttons 143,916
MacDonald, J., Machine for boring and facing cylinders 143,917
Mahan, S. W., Article of food from cider 143,918
Masten, J., Churn 143,919
Mayer, A., Relief valve for fire engines 143,920
McCarthy, E. P., Wagon spring, (reissue) 5,615
McClelland, J. A., Collodion compound 143,772
McComb, D., Bale tie, (reissue) 5,616
McLanahan, J. K., Lubricating pulley 143,830
McMurtry, J., Cotton bale tie, (reissue) 5,617
Meehl and Richards 143,931
Merritt, W., Lumber marker 143,773
Miller, C. M., assignee 143,936
Miller, D. K., Seal lock, &c 143,831
Miller, H. M., Bosom pad 143,921
Montfort, R., Seed planter and fertilizer distributer 143,773
Moore, G. R, Sewer inlet trap 143,774
Morgenroler, J. W., Varnish for coating photographic negatives, (reissue) 5,618
Morthland, R. J., assignee 143,910
Mullaly, J., Keeping open the navigation of canals, &c 143,833
Mullaly, J., Machine for melting snow 143,834
Müller, A., Manufacture of asphalt pipe 143,922
Muller, N., Toy block for object teaching 143,835
Murray, A. A., Gage cock 143,923
Myers, J. B., assignee 143,742
Neff, G. S., Filter 143,924
Nellis, A. J., Horse hay fork 143,775
New England Glass Company, assignee 143,863, 143,864
Newcomb, S. H., Standard for stools, tables, &c 143,836
Nickerson, B. F., assignee 143,906
Nobel, A., Explosive compound, (reissue) 5,619
Nobel, A., Exploding nitro glycerine, (reissue) 5,620
Nobel, A., Method of exploding nitro glycerine, (reissue) 5,621
Oakes, B. F., Car starter 143,837
O'Connor, J., Vehicle wheel 143,776
O'Connor, L. J., Street sweeping machine 143,838
O'Donnell, J. D., Draft cock for soda water, &c 143,777
Oesterling, J., Manufacture of stemmed glassware 143,778
Olbert, G. W., and W. Young, Automatic gate 143,839
Ostrander, J. S., Paper bag machine 143,925
Packard, D. H., Apparatus for molding boot and shoe box toes 143,926
Parsons, N. J., Washing machine 143,779
Pearl, J., Milk cooler 143,840
Peck, G. E., Card and ticket printing press 143,780
Perkins, C. H., Horseshoe machine 143,781
Perkins, C. H., Horseshoe machine 143,782
Pettengill, D., assignee 143,790
Pfefferkorn, C. L. F., and W. Aust, Loom shuttle 143,927
Platts and Walden 143,796
Platts, G., and J. Walden, Machine for crimping and folding leather 143,783
Pope, F. L., Electric signaling apparatus for railroads, (reissue) 5,623
Potter, M. F., Apparatus for treating the eye 143,928
Pusey, J. M., Thill coupling 143,929
Quail, W., assignee 143,875

Quarterman, J., Paint compound 143,841
Reinhart, J., Hobby horse 143,930
Remington, E., & Sons, assignees 143,855
Renshaw, D., Sectional steam generator 143,842
Renshaw, D., Sectional steam generator 143,843
Renshaw, D., Sectional steam generator 143,844
Renshaw, D., Sectional steam generator 143,845
Renshaw, D., Superheater 143,846
Rhode Island Horseshoe Company, assignee 143,781, 143,782
Richards, J., and J. Meehl, Spark arrester 143,931
Richardson, G., Spindle bolster 143,785
Ritchie, F. J., Electric clock 143,847
Ross, J. G., Jack for nailing, &c., boots and shoes 143,786
Ryan, T. W. and T. D., Car coupling 143,932
Seck, W. M., Tenoning machine 143,848
Salmon, I. A., Dental instrument, (reissue) 5,003
Sanderson, S., Plumb and level 143,933
Sanford, E., Securing wheel hubs to shafts 143,849
Schalk, J., Jr., Measuring faucet 143,850
Schedler, J., Apparatus for teaching geography 143,934
Sellers, W., Lawn mower 143,787
Serrell, E. W. and E. W., Jr., Chain suspension bridge 143,788
Shepard, C., Hot air furnace 143,851
Shoe Machinery Manufacturing Company 143,914
Simonin and Adamson, (reissue) 5,610, 5,611, 5,612
Slauson, T. D., Stove pipe thimble 143,852
Smith, R. A., Truck for carrying bricks 143,853
Smith, S., and J. H. Gill, Spring bed 143,854
Smith, T. P. and S. S., assignees 143,798
Smoot, W. S., Revolving fire arm 143,855
Smyth, S., Grate 143,856
Snow, G. H., Circuit closer for railroad signals 143,935
Spencer, J. C., Rotary engine 143,936
Stark, J., Watchmaker's staking tool 143,857
Stock, G., Grand piano 143,799
Steele, F., Alarm safety valve 143,858
Stern & Co., assignee 143,947
Stockwell, J. H., Bee hive 143,937
Stoll, W. W., Malt steep 143,938
Stone, W. F., assignee 143,766
Stoope, N. D., assignee 143,766
Storer, G. W., Evaporating pan 143,742
Streightoff, C. H., Pen and pencil case 143,939
Sturdevant, A. T., Manufacture of paper stock 143,859
Sturges, G. A., Railway rail joint fastening 143,940
Svenson, C., Harrow 143,790
Swan, J., Machine for manufacturing auger bits, (reissue) 5,624
Swineford, P., Car coupling 143,941
Taylor, E. T., Pantaloon 143,791
Teed, T., Endless chain propeller 143,792
Thornley, J., Grading level 143,793
Tice, I. P., Automatic fire extinguisher 143,942
Tice, I. P., Heating drum 143,794
Tolles, C. F., Fetter for cow's tails 143,795
Townley, G. J., Check rein 143,860
Truesdell, L. W., and F. Curtis, Wash boiler 143,796
Tufts, O., Elevator 143,797
United Power Press Company, assignee, (reissue) 5,613
Ure, J., Corn husker 143,797
Van Syckel, S., Apparatus and process for treating petroleum 143,945
Vermilye, J. H., assignee 143,766
Walden and Platts 143,796
Walden, J., and G. Platts, Machine for gumming the edges of elastic shoe gores 143,783
Ward, W., Construction of houses 143,798
Warren, J. L., and J. W. Adderly, Picture frame 143,946
Washburn, B. D., Shutter fastening, (reissue) 5,625
Weil, E., Overalls 143,947
West, P., and G. S. Lee, Game apparatus 143,799
Wheeler, E. T., Reciprocating churn 143,800
White, J. J., Lightning rod 143,861
Whitehead, J., Dandy roller for paper machines 143,862
Whitman, J. M., assignee 143,801
Whittemore, A., Car starter 143,901
Wilde, H., Machine for crozing and chamfering staves, (reissue) 143,948
Williams, J., Fruit drier 5,626
Wing, J., Forming orifices and necks on glass articles 143,949
Wing, J., Mold for glass lamp fountains 143,863
Wrightson, T., Apparatus for lowering weights 143,864
Young and Olbert 143,839

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Copy of classification in full for the use of subscribers furnished on application.

Aërated liquor apparatus 1
Air and gas engines 2
Amalgamators, ore-mills 3
Architecture 4
Artificial limbs, &c 5
Baking 6
Baling-presses 7
Baths, closets, &c 8
Bee-hives 9
Bell and brass founding 10
Bleaching, dyeing, &c 11
Blowers 12
Boats 13
Bolts, nuts, rivets 14
Bookbinding 15
Boots and shoes 16
Braid, thread, &c 17
Breech-loaders 18
Brewing, cider, &c 19
Bricks 20
Bridges 21
Brushes and brooms 22
Buckles, buttons, &c 23
Builders' hardware 24
Butchering 25
Candles, soap, &c 26
Carbureters 27
Carding and roving 28
Carpenters' tools 29
Carpentry 30
Carriages and wagons 31
Cartridges and bullets 32
Casting 33
Casting soft metals 34
Chemical processes 35
Clocks and watches 36
Cloth-dressing, &c 37
Clothes-making 38
Coffins 39
Coopering 40
Cotton 41
Counting and registering 42
Cultivators 43
Cutlery 44
Dairy apparatus 45
Dental instruments 46
Distilling and rectifying 47
Driers 48
Edge tools 49
Electrical apparatus 50
Excavating and grading 51
Fences and gates 52
Files and rasps 53
Fine arts 54
Fire-arms 55
Floor-cloths 56
Flour-mills 57
Food, preservation of 58
Food for stock, preparing 59
Forging 60
Fuel 61
Furniture, &c 62
Garden and orchard tools 63
Gas, distribution of 64
Gas-heaters 65
Gas, manufacture of 66
Gearing 67
Glass 68
Governors 69
Grinding and polishing 70
Gunpowder 71
Harness and saddlery 72
Harrows, rollers, &c 73
Harvesters, A 74
Harvesters, B 75
Hats and felting 76
Hay-tedders, &c 77
Hemp and flax 78
Hoisting machinery 79
Hoop-skirts and corsets 80
Hose and belting 81
Hydraulic engineering 82
Ice-making 83
India rubber 84
Iron and steel 85
Jewelry 86
Journals, bearings, &c 87
Kitchen and table utensils 88
Knitting, netting, &c 89
Lamps and lanterns 90
Laundry apparatus 91
Leather 92
Locks and latches 93
Locomotives 94
Looms 95
Manures 96
Mathematical instruments 97
Medical compounds 98
Metallurgic processes 99
Metal working 100
Meteorological instruments 101
Musical instruments 102
Nails and spikes 103
Needles, pins, &c 104
Ordnance 105
Organs 106
Paints and varnishes 107
Paper-making 108
Paper manufactures 109
Paving 110
Photography 111
Pianos 112
Plating 113
Plows 114
Pottery 115
Poultry, care of 116
Printing 117
Pumps 118
Punching and shearing 119
Railroads, (the "Way") 120
Railroads, (rolling stock,) A 121
Railroads, (rolling stock,) B 122
Revolvers 123
Rock-drilling and blasting 124
Rolling metals 125
Roofing 126
Rope and cordage 127
Safes and vaults 128
Salt 129
Saw-mills 130
Saws 131
Scales and weights 132
Seeders and planters 133
Sewing-machines 134
Sheep, care of 135
Sheet metal working 136
Ship-building, (the hull) 137
Ship-building, (mooring, &c) 138
Ships, propulsion of 139
Silk 140
Spades, shovels, &c 141
Spinning 142
Sports 143
Stabling, stalls, &c 144
Starch 145
Stationery 146
Steam-heaters, &c 147
Steam-boilers, (construction) 148
Steam-boilers, (furnaces, &c) 149
Steam-engines 150
Steam-pistons, &c 151
Steam-valves 152
Stone, lime, and cement 153
Stoves and ranges 154
Sugar and molasses 155
Surgical instruments 156
Surveying and optical instruments 157
Telegraphs 158
Thrashing, &c 159
Tobacco 160
Toilet articles 161
Trunks and satchels 162
Tubs and wire 163
Type and stereotype 164
Umbrellas, fans, &c 165
Ventilators 166
Water, distribution of 167
Water-wheels 168
Willow and rattan 169
Wire-working 170
Wood-screws 171
Wood-lathes 172
Wood-working, (machine-tools) 173
Wood-working, (special machinery, A) 174
Wood-working, (special machinery, B) 175
Wood-working, (special machinery, C) 176

COPIES OF DRAWINGS OF BACK ISSUES.

Since July 1, 1869, the drawings filed with the applications for patents have been copied and multiplied by photographic processes, so that copies can be furnished at prices much less than those previously charged when all reproduction of patent drawings was by hand tracing. From July 1, 1869, to December 31, 1869, the copies were photographs; from January 1, 1870, to the present time, they have been photo-lithographs.

The sizes of the drawings have not been uniform throughout this period, as they have been governed, to some extent, by the size of the patents, which has also varied. The two sizes which exist are, respectively, 10 x 15 inches and 7½ x 10 inches. It is in contemplation to reduce those of the larger size to the smaller, so that sets of drawings of classes may be uniform in size, and that the volumes in which the patents are assembled in order of date may also correspond in size.

Congress having authorized the reproduction of the patented drawings issued previous to the date (July 1, 1869,) at which photographic copying was introduced, the reproduction proceeded in order of time, working backwardly through June, May, &c., 1869, till the issue of November 26, 1867, was reached. When that point had been reached it was determined to proceed in future by subject-matter instead of by date, and the following subjects have been completed or are in course of completion, carrying the photo-lithographic reproduction of the drawings in the classes stated back to the year 1836; also including such drawings of patents as were restored and again placed on record in the Department after the fire which consumed the Office records in the year 1836.

In the statement of the subjects and numbers following it will be borne in mind that the official subject-matter classification, date of 1872, by which cases are assigned for examination, governs the disposition of the drawings in the folios of the Office, and each class embraces numerous details appertaining or allied to the main subject-matter of the class.

The statement gives the approximate number of drawings of these classes.

HARVESTERS; including all machines for gathering and securing crops, (excepting hand-rakes and hand-forks)	6,500
SEWING-MACHINES and attachments	2,000
FIRE-ARMS; including breech-loaders, revolvers, cartridges, ordnance, projectiles, fuses, blasting, and torpedoes	4,000
PRINTING; including presses, type, and printers' furniture.	2,500
FELTING and HATS; including caps, bonnets, flock, &c.	1,200
WEARING APPAREL; including clothes-making, patterns, and work-table appliances, (excepting head and foot coverings, hoop-skirts, corsets, and paper garments)	1,600
STATIONERY; including desk and office supplies, stamps, tickets, advertising, and signs	1,400
CARRIAGES and WAGONS	6,000
BRIDGES; including ferry-guards, girders and columns, piers	408
CARDING, CLOTH, CORDAGE, KNITTING, SILK, SPINNING, WEAVING	4,800
RAILWAYS, complete, about	3,500
ELECTRICITY, (in progress,) to July, 1871	888
TEXTILE, (in progress,) to July, 1871, about	4,800

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 200 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorized by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 9,000 pages of specifications, 3,120 pages of drawings—12,720 pages.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 18. TUESDAY, OCTOBER 28, 1873 PRICE { $5,00 per year—single. / $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

PATENT CONGRESS AT VIENNA.

It will be seen, by referring to the OFFICIAL GAZETTE of August 26, 1873, (vol. 4, p. 209,) that by the last resolution the congress perpetuated itself by the appointment of a standing committee. This committee met the day after the adjournment of the congress and transacted the following business:

At a meeting of the executive committee, (appointed by the International Patent Congress to carry out the resolutions of the congress, passed on the 4th, 5th, 6th, 7th, and 8th of August, 1873, with power to add to their number,) held on Saturday, the 9th of August, Baron von Schwarz Senborn, honorary president of the congress, in the chair.

Present—Dr. William Siemens, president of the congress; Th. Webster, Q. C.; Mr. Hamilton Hill, Mr. Eugen Langen, Dr. v. Rosas, Mr. Dr. Jannasch, Dr. H. Grothe, Dr. Weinmann, Dr. jur. Rosenthal, Syndicus Dr. André, Hofrath v. Engerth, Professor Blake, Mr. Carl Pieper, C. E.

It was resolved—

1. That the Honourable J. M. Thacher, Mr. B. B. Hotchkiss, and Mr. S. Remington, of the United States, be added to the committee.
2. That Baron von Schwarz-Senborn be President of the Executive Committee, whether residing at Vienna or elsewhere.
3. That Dr. William Siemens be requested to write a preface or introduction to the proceedings of the congress, to be dedicated to Baron von Schwarz-Senborn. (Dr. W. Siemens acceded to the request.)
4. That Mr. Carl Pieper, C. E., of Dresden, be the General Secretary of the Executive Committee.
5. That Dr. v. Rosas, of Vienna, be Treasurer of the Executive Committee.
6. That Dr. Rosenthal, of Colorne, and Dr. v. Rosas act as special assistants to the General Secretary for the publication of the proceedings.
7. That the members of this committee residing in foreign countries constitute special committees of their respective nationalities, with power to add to their number, to carry out the resolutions of the congress, each local committee to be empowered to enroll members, call meetings, and collect subscriptions of one pound sterling, or upward, per annum, to be accounted for to the General Secretary and Treasurer, and to do such acts as may be necessary for carrying out the resolutions of the congress.
8. That the President and General Secretary prepare by-laws, to be submitted to a general meeting for approval.

BARON V. SCHWARZ SENBORN.
CARL PIEPER, *General Secretary.*

By reference to the seventh resolution (supra) it will be seen that the members of the committee residing in foreign countries are authorized to organize branch associations. Steps will be taken to carry out this work in this country.

DIGEST OF FOREIGN PATENT LAWS.

PERSIA.

REPORT OF MR. R. F. THOMSON, OF THE BRITISH LEGATION.

In reply to your lordship's circular of the 14th of August last, I have the honor to state that no law exists in this country respecting inventions. Everybody here is free to invent or imitate.

PORTUGAL.

REPORT BY MR. WM. DORIA, OF THE BRITISH LEGATION.

On the 17th of March, 1868, the present law in force was published for regulating the concession of patents, and regulations were laid down in the Civil Code for the protection of public interests against the too excessive exercise of particular privileges granted by patents, and the regulations were assimilated more to those adhered to in other countries granting such patents.

It is, therefore, to the Civil Code that reference must be made for those provisions of the law which protect patent rights from being infringed. The punishment to be awarded to those persons who infringe these

rights is to be found inscribed in the Penal Code of the country.

Patents are granted for a term of years not exceeding fifteen, to the inventor or discoverer, to enjoy during that time the right of property.

From the right of property to an invention is derived the exclusive right of producing or manufacturing the articles which constitute the said invention. Persons making additions to their inventions enjoy the advantage of the additional improvements, and they may apply for a French patent.

The exclusive right of property over inventions is secured by the administrative laws and regulations—that is to say, by the laws having reference to movable property, except in cases where the patent has been granted gratuitously, or in return, as compensation, for service performed.

The publication of patents, their drawings, models, and specifications, which are required for obtaining the concession, must be shown gratuitously to every one who desires to see them. Applicants, by payment, can procure copies. On the government devolves the duty to announce officially what patents have fallen into the dominion of the public.

Patentees who have been injured by the infringement of their patent can institute a criminal suit, or enter a civil action to recover damages.

The right of property conferred by a patent is transmissible by will to heirs and successors.

A register of all patents is kept in the Department of Public Works.

A tax of 120,000 reis is exacted on granting a patent for fifteen years, equivalent to about $140.00. Of this amount 75,000 reis, or $88.00, is set apart for a fund for the advancement of industry. The remaining sum is absorbed in stamps and fees paid to government.

Medicines, articles of food, simple changes in the form of an object patented, and ornaments are excluded from obtaining patents.

The civil governor of the district is charged with the duty of granting patents, on whom devolves the duty also of forwarding to the Office of Public Works information for their due registration.

An invention which involves danger to public safety is prohibited from obtaining a patent.

A foreigner can only obtain a patent subject to the rules laid down by the Civil Code of Portugal, and that also only for the period of time before it falls under the dominion of the public, in conformity with those rules.

No concession of patent* for an improvement of an article already patented is granted, except to the patentee himself, during the first year after the patent is granted. Application by another person may be made before the expiration of the year to the proper department, where such application will be taken into consideration.

This provision is to insure to the first applicant the preference over other persons, with the exception of the original patentee, who always has the preference accorded to him, provided his application is also made during the first year.

* Exclusive right to import foreign patents is not granted; only the privilege for their manufacture in Portugal is guaranteed by patent.

The punishment awarded by the Penal Code to persons who infringe patent rights is subjection to a fine, which is imposed by the judge at his discretion, varying from 30,000 reis to 300,000 reis, or from $35 to $350, and the confiscation of the articles which have been employed in the violation of the patent.

For losses sustained by the patentee through the infringement of his rights, he can obtain indemnity by a civil action.

The number of patents granted during the last six years amounts to 119, as shown by the following table:

	Patents.
1867	22
1868	17
1869	32
1870	32
1871	11
1872	14
Total	119

There is in Portugal a feeling generally so much in favor of a system of protection, that I think I am warranted in assuming that it will be some time before the principles of free trade can make an advance toward a more extended view of the advantages to be derived from the abandonment of the protectionist system; and as there is much affinity between the principles on which the oppouents of free trade base their opinions and those held by the partisans of patent rights, any proposal for the abolition of patents in Portugal would, I think, be met with much opposition, showing that public opinion is not in favor of abolishing the system.

RUSSIA.

REPORT BY MR. FORD, OF THE BRITISH LEGATION.

Patents may be obtained for all kinds of discoveries, inventions, and improvements of general utility, or a process of carrying on any art, trade, and manufacture.

Patents are granted without being guaranteed by the government.

The law admits of patents for inventions that are privileged abroad.

Patents for inventions that are already known, but not privileged abroad, are granted only in case of exclusive utility, taking into consideration the expenses required for introducing them.

By the 152d Article of the Russian Code of Laws, vol. xi, relating to manufacturing industry, persons obtaining patents are bound to bring the patented invention, &c., into operation in Russia before the expiration of the fourth part of the time granted by the patent, and a notification of the fact of the invention being carried out must be made to the Department of Interior, Trade and Manufactures in the course of the six months following, and the exact locality stated where the invention is being carried out, otherwise the patent becomes public property. The declaration of the carrying out of the invention must be certified by the proper local administration.

The Department of Trade and Manufactures, on receipt of an application for a patent, accompanied by documents, delivers at once to the applicant a certificate of acknowledgement for such documents.

In cases in which a patent is not granted, the applicant is reimbursed the amount of the tax fixed for the patent, less the charges incurred on account of stamps, postage, and advertisement in the public newspapers.

Any patentee who may change his own invention by making an improvement in it, may take out another patent for such alteration by paying a new tax; but in every case a notification, together with a special description of the improvement, must be made to the proper department on the subject.

Any person making an improvement on an invention already patented can only obtain a special patent for such improvement after having come to terms with the holder of the original patent.

2. *Formalities.*—The petitioner must present to the Department of Interior, Trade and Manufactures—

(1) A petition stating the time for which the patent is desired, and the subject to which the invention refers. If the invention has been patented abroad, the date on which a patent was granted for it must be stated, as well as the number of years for which it has been granted, or for which a prolongation of it is intended. It must likewise be stated whether the patent has been granted in a country in which the payment of the tax is made annually, as is the case, for instance, in Belgium.

(2) An exact description of the object for which the petitioner wishes to obtain the privilege or patent, specifying all the principal details, advantages, and the way of employing it, with the plans and drawings respecting it. If, for a clearer explanation, it should be necessary to add to the description a model, the petitioner is bound to forward it.

A translation of the description must be furnished in the Russian language.

(3) A receipt certifying the payment of the duties, according to a fixed rate.

3. *Duration.*—The duration of a patent is reckoned from the day on which the patent is signed.

Patents for inventions belonging to the applicant are granted for three, five, or ten years—the longest term.

Patents for the introduction of foreign inventions cannot exceed the term of the privilege granted abroad to the inventor; at all events cannot exceed six years, unless the petitioner be the inventor himself, in which case he may obtain a patent for a term of ten years.

4. *Tax.*—The duties for discoveries, inventions, and improvements belonging to the applicant for the patent are:

For three years, 90 roubles=$71.49; for five years, 150 roubles=$119.16; for ten years, 450 roubles=$357.48.

For the introduction of foreign inventions:

For one year, 60 roubles=$47.66; for two years, 120 roubles=$95.33; for three years, 180 roubles=$142.99; for four years, 240 roubles=$190.66; for five years, 300 roubles=$238.32; for six years, 360 roubles=$285.98.

5. *Transfer of patents.*—The patentee may transfer the patent to another person, wholly or partly, or be in partnership with some one else; but the law prohibits either to cede it to any company of shareholders, or be in partnership with it, without being specially authorized by the government.

6. *Loss of rights.*—The causes of forfeiture are:

(1) If the invention has not been fully carried out before the expiration of the fourth part of the time granted by the patent.

(2) The want of novelty.

(3) Proof that the patentee falsely gave out the invention or discovery for his own, and if the real inventor claims it.

(4) The deficiency of the specification, or a dissimulation of the essential parts, indispensable for procuring the declared results.

(The expiration of patents is published in the newspapers.)

7. *Infringement.*—The patentee has a right to prosecute counterfeiters, and to claim damages in respect of the infringement of the patent.

COMMISSIONER'S DECISIONS.

ORISON UNDERWOOD.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of Orison Underwood for patent for* IMPROVEMENT IN BOOTS AND SHOES.—*Decided October 31, 1873.*]

Invention being established, and the claims properly limited, the small amount of invention or degree of improvement will not prevent the granting of a patent.

THACHER, *Acting Commissioner:*

This invention consists in alleged improvements in the means of attachment of metallic heels to boots and shoes. Applicant presents two claims, the first of which is as follows:

The flanged heel A, the plate A', the insole D, and the outer sole E, arranged and connected by means as described.

This is the broader claim of the two, and if allowable, it follows necessarily that the other is also, for it comprehends the same parts with more limitations.

The difference between the arrangement of the parts embraced in the claim quoted and that shown in the patent of Prescott, cited by the Examiner, is in the location of the heel-plate between the insole and the outsole, which latter is carried into the heel by the applicant, to afford a better hold for the fastening-screw. It is obvious, I think, that the heel will thereby be more securely fastened to the boot than if the outsole terminated at the heel-breast, as in Prescott's device; and this is the object sought.

The question is, whether the extension of the outsole thus into the heel for that object amounts to an invention?

Where different means are employed, and a better result obtained, it can seldom be soundly assumed that an invention has not been made. These points are the uniform and sure tests of invention, the only condition in applying them being that the difference in the result or in the means must not be frivolous or insignificant. Clearly neither difference in this case is of that character, however easily it may seem to have been arrived at, starting from the stand-point of the previous condition of the art. The invention is not great, probably, yet, tried by the only safe criterion, I think it is an invention. This being established, and the claims being properly limited, the amount of invention exhibited or

the degree of improvement made is not a matter worthy of much consideration.

In discussing a case of similar character—*Ex parte Samuel Toomey, Commissioner's Decisions*, 1869, p. 102—Commissioner Fisher said: "These claims are very limited, and in their present form are not anticipated by the references. As the fastenings thus described seem to be more complete and efficient than those referred to, and to obviate some of the objections to prior devices, I do not care to weigh too nicely the degree of invention exercised in the changes which applicant has made." In *Carr* vs. *Rice*, 1 Fisher, 198, the Court said: "The law does not require the patentees to prove their discovery to be useful to any eminent or large degree. It is sufficient if it produces an improved article."

The decision of the Board of Examiners in Chief must be overruled.

BLOOMFIELD BROWER.—*Appeal.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Bloomfield Brower for patent for* DESIGN FOR INKSTANDS.—*Decided October 28, 1873.*]

A square inkstand with its angles chamfered, and a square-headed movable stopper with its angles similarly chamfered, held not to constitute together a patentable design for a single article of manufacture.

The ordinary use of an article for the form of which a design patent is sought is a controlling consideration in determining whether or not it presents proper subject-matter for a design patent.

As the ordinary use of an inkstand and stopper requires their separation, they do not present such a fixed unit as to constitute them a single design.

The relative positions of connected parts to constitute a design ought to be uniform and fixed, because, as a rule, a design is essentially unitary and unvarying in character. It cannot embrace alternates or equivalents of form, but is arbitrary and unchangeable.

THACHER, *Acting Commissioner:*

Applicant claims a "design for a glass inkstand and stopper of glass, made square, with equally chamfered edges, substantially in the manner above described."

The edges or angles of a square inkstand are all chamfered, and the chamfers are all of equal width. A square stopper-head is provided, having its edges or angles all similarly chamfered. The photographic illustration filed exhibits the square chamfered stopper in the chamfered inkstand in such a position that the sides of the squares are parallel with each other.

The Examiner holds that the bottle and the stopper are separate articles, and exhibit separate and independent designs. On the other hand it is maintained in behalf of the applicant, in substance, that while this is true in one sense the two have an intimate relation respecting the harmony of their individual forms to produce an esthetic effect when they are brought together for use or display, and are presented to the eye as a unit. He alleges that he has made the stopper-head of the form of the inkstand in conformity with a law of fitness or correspondence relating to forms to be connected or conjoined, from which what is pleasing to the eye, and what we naturally term beautiful, results. There is apparently some force in this reasoning; but it should be remembered that the ordinary use of an article, for which a design is presented, is a controlling consideration in determining whether or not the design is proper subject-matter for patent as such.

The object of an inkstand and stopper is to preserve the ink for use; but whenever it is being used they must be separated. The stopper must be removed, and that destroys the design alleged to be constituted by the two. There is not, therefore, such a fixed unity of design, considering the ordinary use of an inkstand and its stopper, as to constitute the two separable and often separated parts a single design.

Another consideration of importance is, that the relative positions of the two parts when connected ought to be uniform and fixed in order to constitute a design, which is, as a general rule, a thing essentially unitary and unvarying in character. A design cannot embrace in its scope alternates or equivalents of form. It is arbitrary and unchangeable, either by the separation or the rearrangement of its features. In this case it is obvious that there is nothing in the construction presented to preserve the alleged design shown, even when the stopper is in place, for it may be turned out of parallelism with the square of the stand, whereby the esthetic effect described will be violated and the original design destroyed. It would then be like a capital misplaced on the shaft of a column.

It is not denied by the applicant that a design for an instand and a stopper-head, respectively, might be patented. The exterior of the stand and the stopper, being individually ornamental and novel in form, would each present subject-matter for patent. The two permanently united, or so constructed as always to occupy the same relative positions to each other, might also, no doubt, present subject-matter for patent, were such a union consistent with their ordinary use; but neither of these conditions is found in this case. I therefore concur with the Examiner that a division of this application is necessary. The inkstand and stopper, as presented, do not constitute a single unitary design for an article of manufacture.

The Examiner's decision is affirmed.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,599.—Defecating and Clarifying Cane-Juice.—Granted to RICHARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 3, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,243.—Water-Closet Basins.—Granted to WILLIAM BOCH, Sr., November 29, 1859. Application filed June 10, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,244.—Machines for Registering Music.—Granted to HENRY F. BOND, November 29, 1859. Application filed August 29, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,262.—Journal-Boxes for Saw-Mill Carriages.—Granted to WM. M. FERRY, November 29, 1859. Application filed August 30, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,276.—Manufacture of Rubber Hose.—Granted to THOMAS J. MAYALL, November 29, 1859; and reissued October 22, 1872. Application filed August 19, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,321.—Molding for Metal Casting.—Granted to JOHN P. BROADMEADOW, November 29, 1859. Application filed August 15, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,327.—Nursing-Bottles.—Granted to FRANCIS J. LA FORME, November 29, 1859, and reissued January 14, 1868. Application filed August 27, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,329.—Boot and Shoe Tips.—Granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, and August 4, 1868. Application filed August 22, 1873. Testimony closes October 28, 1873. Hearing November 12, 1873.

26,339.—Water-Wheels.—Granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1860, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,401.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 28, 1869. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,408.—Composition for Kindling Fire.—Granted to ELIZABETH BELLINGER, December 13, 1859, and reissued August 7, 1866. Application filed September 15, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,410.—Seed-Planters.—Granted to WILLIAM BLESSING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,454.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, Jr., December 13, 1859, and reissued April 3, 1860. Application filed September 13, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,475.—Breech-Loading Fire-Arms.—Granted to BETHEL BURTON, December 20, 1859, and reissued December 21, 1869. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 12, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,486.—Pipe-Molding.—Granted to JOHN FERTH and JOHN INGHAM, December 20, 1859, and reissued April 28, 1863. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,487.—Screw-Taps.—Granted to WILLIAM and ROBERT FOSTER, December 20, 1859. Application filed September 18, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Trap.—Granted to JAMES A. LOWE, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,513.—Nail-Plate Feeder.—Granted to JOHN NEWELL, December 20, 1859. Application filed September 16, 1873 Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL L. KENDALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,582.—Harvesters.—Granted to JOHN GORE, December 27, 1859, and reissued January 15, 1861. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to JONATHAN P. GROSVENOR, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to SAMUEL LEEDS, December 27, 1859. Application filed September 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Porous Ware.—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, December 27, 1859. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to BENJAMIN F. STUNTEVANT, December 27, 1859. Application filed September 25, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,674.—Clothes-Driers.—Granted to B. B. HAWES, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to FRANCIS C. LOWTHROP, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,808.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 15, 1869. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,822.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,860.—Machines for the Manufacture of Tinware, granted to SAMUEL J. OLMSTED, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,905.—Stitches.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROBERT O. MELDRUM and AMOS B. PAXSON, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860, and reissued August 1, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,942.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,952.—Lamps, granted to GEORGE NELSON, January 24, 1860. Application filed October 18, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOMINSKY, January 31, 1860, and reissued March 26, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,023.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTLER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closed January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closed January 6, 1874. Hearing January 21, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 28, 1860; and reissued August 4, 1868. Application filed October 20, 1873. Testimony closed January 27, 1874. Hearing February 11, 1874.

27,436.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOFT, March 13, 1860. Application filed October 6, 1873. Testimony closed February 10, 1874. Hearing February 25, 1874.

30,467.—Apparatus for Slinging Pigs, granted to ABRAHAM and EDWARD M. DERBY, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closed December 30, 1873. Hearing January 14, 1874.

31,262.—Pare-Bezes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closed December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

25,936.—Improvement in Cut-Off Valves of Steam Engines, granted to EDWARD R. ARNOLD, November 1, 1859.

Claims.—1. Making the tappet C, Fig. 4, and the ends of the jointed valve-rods D D', Fig. 3, inclined in a direction at right angles to their lines of motion, and combining and arranging them substantially as herein set forth.

2. The combination of the regulator with a tappet, constructed and operated substantially as described, for the purpose specified.

25,978.—Improvement in Tackle-Blocks, granted to ISAAC E. PALMER, November 1, 1859; reissued September 8, 1863, numbered 1,534; reissued April 11, 1865, numbered 1,932; reissued December 8, 1868, numbered 3,226.

Claim.—The construction of a tackle-block and pulley, whereby the rope or fall, when desired, may be clamped between a portion of the pulley and a portion of or surface connected with the block, substantially as herein described, by simply leading it in a direction oblique or lateral to the plane of revolution of the pulley, without tying, or the use of dogs or movable stops, or any other means of fastening.

25,984.—Improvement in Braces for Bits, granted to N. STOFFORD, November 1, 1859; reissued April 23, 1867, numbered 2,576.

Claim.—1. A bit-stock constructed with a tapered socket transverse to the arm or portion of the stock in which it is formed, and said arm slitted along its center line so as to divide said socket lengthwise into two equal parts to form an expanding socket, substantially as and for the purpose described.

2. The slitted socket A, constructed with the inward projections or lips *d d* at its larger end, to close over the shoulders of the bit-shank for the purpose of retaining said shank within the socket when clamped, substantially as set forth.

3. Arranging the socket A of a brace with a slot, *c*, as described, in combination with a thumb-screw, D, and slips or projections *d* or their equivalents, substantially as and for the purpose set forth.

23,003.—Improvement in Telegraphic Machines, granted to GEORGE M. PHELPS, November 1, 1859.

Claim.—1. Producing from a magneto-electric battery the momentary electric currents required for actuating the printing mechanism by giving momentary motion to the armature or other current-inducing part of the magneto-electric battery by means of a set of finger keys, which, when depressed, are controlled in their action upon the current-inducing part of the magneto-electric battery by a mechanical contrivance which constantly moves in harmony with the uninterruptingly-revolving type-wheel, substantially as herein described.

2. Increasing the capability of the instruments for telegraphing by an increasing the speed of the transmitting device and type-wheel in relation to the motion of the parts which perform the printing that two or more types shall pass the platen while the printing mechanism is acting once, as herein described.

3. Turning the cylindrical platen, while each impression is being made, by means of rings of teeth R and T upon the type-wheel and platen, as and for the purpose herein set forth.

4. Making a revolving wheel or shaft, U or *i*, turn the corrector M, armature C, or another wheel or shaft, a certain fixed distance with the same speed as itself, at any time, and any desired number of times, by the use of a ratchet-wheel, V or A, catch W or *f*, guide X or *h*, and detent K or *e*, all arranged together and with the said driving and driven wheel or shaft for conjoint operation, as herein set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date October 28, 1873.]

6,966.—Toy Target.—SAMUEL HAHN, Philadelphia, Pa., assignor of one-half his right to SIMON OPPENHEIMER, same place. Application filed June 7, 1873. Term of patent 3½ years.

6,967.—Handle of Spoons, Forks, &c.—BERNHARD D. BRIEDERHAUS, New York, N. Y. Application filed October 11, 1873. Term of patent 7 years.

6,968.—Fly-Traps.—DAVID K. THOMPSON, Clark, Pa. Application filed September 22, 1873. Term of patent 14 years.

6,969.—Spoons and Forks.—GEORGE WILKINSON, Providence, R. I., assignor to GORHAM MANUFACTURING COMPANY, same place. Application filed August 29, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date October 28, 1873.]

1,511.—Shingles.—LA MOTT M. BLAKELY, New York, N. Y. Application filed October 6, 1873.

"A within a border."

1,512.—Flour.—HAXALL, CRENSHAW & Co., Richmond, Va. Application filed October 22, 1873.

"'CRENSHAW, 196, Richmond, Va.'"

1,513.—Flour.—HAXALL, CRENSHAW & Co., Richmond, Va. Application filed October 22, 1873.

"'HAXALL.'"

1,514.—Preserved Fish.—OCEAN TROUT COMPANY, Port Monmouth, N. J. Application filed September 10, 1873.

"a fish, with the words 'Ocean Trout,' 'Packed by the Ocean Trout Co., Port Monmouth, N. J.,' and 'pickled.'"

1,515.—Glass Shades, Cylinders, and Similar Glass Goods.—S. J. PARDEMUS & Co., New York, N. Y. Application filed October 16, 1873.

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date October 28, 1873.]

ORIGINAL PATENTS.

143,950.—Axle-Box for Vehicles.—COTTON H. ALLEN, St. Louis, Mo. Application filed March 17, 1873.

The interior frictional surface of the box is comparatively small, and a spiral groove for oil is formed.

Claim.—An axle-box composed of a helically-wound wire interiorly and a cast-metal external wall cast upon the said wire, substantially as described.

143,951.—Salt and Pepper Dredge Combined.—THOMAS B. ATTERBURY, Pittsburg, Pa., assignor to JAMES S. ATTERBURY and THOMAS B. ATTERBURY, same place. Application filed October 3, 1873.

A double-chambered dredge, with a partition extending above its upper rim to form a closing aperture between the salt and pepper apertures in the cover, with the apertures some distance outside of the vertical axis of the chambers.

Claim.—The within-described combined salt and pepper dredge with a partition, *b*, extended up beyond its screw-fastening, in combination with the cover or top which is perforated on two sides of its vertical axis, and fits snugly down upon said partition, substantially as and for the purpose described.

143,952.—Grindstone-Hanger.—SOLOMON L. EIGHALL, Chicago, Ill. Application filed June 19, 1873.

Claim.—The solid pitman-shaft A B, provided with a bearing, C, for the anti-friction rollers to travel on, with a collar, F, and a removable shaft, E, which shaft supports a collar, I, and jam-nut H for hanging the stone in place, as set forth.

143,953.—Grain-Sampler.—JAMES J. BOM, Ranteul, Ill. Application filed September 10, 1873.

A triangular metal instrument, constructed to puncture a sack of grain, being hollow and having several compartments, has a slide, which is removed after the instrument is entered. When the compartments are filled the slide is closed over them and the instrument is withdrawn, and then, the slide being withdrawn, the samples at various depths can be seen.

Claim.—The combination of the receptacle A, provided with the compartments and point C, with the cover B, constructed as shown, substantially as and for the purpose set forth.

143,954.—Utilizing Gas as a Motive Power.—OGDEN BOLTON, Jr., Chartier's township, Allegheny county, Pa. Application filed July 17, 1873.

To the chamber in which the explosions of mixed gases take place is connected a pipe for communicating the power of the explosion through a column of water, and an independent pipe for resupplying the chamber with water after each explosion.

Claim.—The combination of a chamber for the explosion of gaseous or non-gaseous explosives, an independent supply-pipe for supplying water thereto between explosions, and a pipe for communicating, by water-pressure, the power of the explosion, substantially in the manner set forth.

143,955.—Guide for Sewing Shoes.—HIRAM BOND, Haverhill, Mass., assignor to MOSES HOW, same place. Application filed July 31, 1873.

For guiding the edges of two pieces of leather, to be sewed with a lap-seam. A disk attached to the cloth-plate guides the edge of the lower piece, and a disk applied to an arm fastened to the needle-head guides the edge of the upper piece, the presser-foot resting between the two.

Claim.—The combination of the two guides A and B, arranged in relation to the sewing mechanism substantially as described.

143,956.—Metallic Piston-Packing.—WILLIAM A. BOYDEN, Harrisburg, Pa. Application filed September 20, 1873.

Claim.—The series of wedges B, provided with springs D, combined and arranged with the piston-head A, having openings *a* and inclines *g*, the follower E, packing-ring C, and intermediate ring F, substantially in the manner and for the purpose set forth.

143,957.—Ice-Pick.—SIDNEY S. BOYNTON and DANIEL KEEFE, Peoria, Ill. Application filed October 1, 1873.

Claim.—The ice-pick and chisel or plane A, having a series of large triangular cutting-points, with sharp sides or lateral edges from point to crotch, or angle between each point, substantially as described.

143,958.—Spring-Wagon.—GEORGE A. BEICH, Towanda, Pa. Application filed August 20, 1873.

Claim.—The single metal springs C, in combination with the journaled brackets D and side spring-bars B, all constructed substantially as and for the purpose specified.

143,959.—Bucket.—RUTH T. BROWN, Newport, Ky. Application filed October 7, 1873.

The bucket has one flat side with a projecting hanger, the round or curved side has several pockets for holding brushes, soap, cloths, &c., for scrubbing purposes:

Claim.—The house-cleaning bucket herein described, composed of bucket A, and pockets C D E, and box or tray F, all substantially as and for the purpose set forth.

143,960.—End-Gate for Wagons.—THOMAS A. BROWN and JOHN L. BROWN, Roanoke, Ill. Application filed July 15, 1873.

The end box, pivoted to the sides of the wagon bottom, is designed to open only upward.

Claim.—The combination of the box B, pivoted rods *e e*, staples *f f*, wagon-box A, staple *a*, hook *d*, and staple *h*, said box pivoted at *i i* to the wagon-sides, all substantially as and for the purpose set forth.

143,961.—Billiard-Table Cushion.—SOLOMON BRUNSWICK and HENRY BOEHLINGHAUS, Sr., St. Louis, Mo.; said BOEHLINGHAUS assignor to said BRUNSWICK. Application filed June 11, 1873.

A steel spring-plate, fortified by a second cloth-covered steel plate, is placed behind an outer sheet of rubber. A rubber deadener is placed above and to the rear of the outer steel plate to receive its impact in ferrible shots.

Claim.—The billiard-cushion described, having the steel-plate springs *e e'*, rubber covering E, and buffer D, constructed and arranged as and for the purpose specified.

143,962.—Pruning-Hook.—JOHN CHRISTY, Clyde, Ohio. Application filed October 3, 1873.

The hook is furnished with a curved extension behind the regular curve, and also in rear of the vertical tang. This allows the other blade to be connected by means of a slot and link. The shank and tang of the last-named blade is connected by a link to a point below the tang of the movable blade. The cut is effected by pulling down upon the handle.

Claim.—1. The double bend in the hook above the tang, one bend being in rear of and the other in front of the tang, as and for the purpose described.

2. The combination of the hook with its two bends, C C^2, and tang C^1, as described, the pivoted slotted plate D with convex edge, the shouldered lever E, the connecting-rod F, and the handle A, substantially as described.

143,963.—Earth-Auger.—ERASTUS H. CLARK, Appleton, Wis. Application filed August 1, 1873.

The rimming-knives turn on pivots so as to be adjustable in and out, and the adjustment is limited by a slot and bolt. The pods carry conical cutting-knives, and open laterally on hinges to discharge the earth. They are retained in position by the spring-bolts E E, pins F, and key G.

Claim.—1. The peculiar construction of the rimming-knives M M and the mode of attaching them to the auger by means of bolts N N serving as pivots for the knives to turn on, and an oblong slot in the knife, through which a bolt, Q, passes to admit of setting the knife out or in.

2. Ball pieces E E, in combination with shaft A and pin F and key G, substantially as described.

3. Cylinders C C, hinged to bar B, in combination with knives H H, substantially as described.

143,964.—Meldback.—GEORGE D. CLEAVELAND, Flint, Ind., assignor of two-thirds his right to HORACE E. DAVIS and LUCIUS W. HALL, same place. Application filed July 19, 1873.

Designed to permit the disengagement of the horse in case of accident.

Claim.—The tube A, with slot *b*, piston F, and stirrup or ring G, in combination with the shafts E E, substantially as and for the purpose set forth.

143,965.—Pavement.—SAMUEL J. DAVENPORT and JOHN WARD, Albany, N. Y. Application filed November 23, 1872.

The earth bed is rammed or pressed, and a layer of concrete of coal-tar and coarse gravel is laid on it. The stones are then set in the concrete, and the interstices between them are filled nearly to the top with concrete of the same materials as the bed, after which the whole surface of the stones and concrete filling is sluashed with liquid coal-tar, and the top layer of distilled tar and fine gravel or coarse sand is laid on and rolled, the coal-tar acting as a binding cement between the top layer and stones and concrete filling.

Claim.—1. In a pavement, the combination of the upper fine concrete dressing D and coarse concrete interstices *a*, with the stones C, elastic concrete bed B, and packed earth bed A, substantially as and for the purpose set forth.

2. In a concrete stone pavement having the interstices of the stones filled with concrete, and a top dressing, D, the slushing of the top surface of the pavement immediately after the filling of the interstices and before the application of said top dressing with coal-tar, applied either cold or hot, as described, for the purpose set forth.

143,966.—Spring-Equalizer.—HORACE DAVIS, Berlin, Wis. Application filed May 29, 1873.

To the spring-clips are pivoted the short arms of equalizing-levers, the upper ends of which are secured to the bolster by means of links.

Claim.—The slotted spring-clips C embracing the axle B, in combination with the elliptic spring A, the bent or V-shaped levers E, having the connected arms *c'*, and pivoted to the clips, and the short pivoted links *d*, all constructed and arranged to operate substantially as and for the purpose specified.

143,967.—Upright Piano-Forte.—GEORGE H. DAVIS, Boston, Mass. Application filed July 23, 1873.

Claim.—1. The combination of the shelf *a* and flange C with the metallic frame A, the wooden straining-pin bar B, and the back frame D, all being arranged and applied together substantially as set forth.

2. The combination of the series of wooden plugs *d*, or harmonic connections, with the perforated flange C, the metallic frame A, the straining-pin bar B, and the back frame D, all being connected and arranged essentially as specified.

143,968.—Chain-Machine.—JAMES DAYKIN and WILLIAM B. CASE, Cleveland, Ohio. Application filed December 4, 1871.

The blank is pushed through the loops formed on the ends of the preceding link. These loops rest against a die having lateral projections, around which the blank is bent by the levers, the points *w w* on which crimp the link at *y*. A slide is next pressed forward and bends the front end of the link, forming the curve A. A forked lever, *k*, bends the ends of the wire around the pin L, forming the loops for the next connection.

Claim.—1. The removable die *t*, arranged relatively to the head E and slide B, as shown and specified.

2. The levers F G provided with projections *m m*, in combination with head E and removable die *t*, as specified.

3. In a chain-machine, the levers F G, provided with projections *m m*, treadle C, and slide B, in combination with removable die *t*, head E, and lever K, when combined, arranged, and operating as herein specified and set forth.

143,969.—Guide for Shoe-Sewing.—LAURENS EMMANUEL DE WARU, Baltimore, Md. Application filed May 26, 1873.

The guide is formed of wire and attached to the cloth-plate close to the needle, and is adapted to guide the quarters of a shoe so that the curved portions forming the heel are correctly lapped and guided to the needle, which stitches them together. In passing through the guide the material is free to rise and fall.

Claim.—The double gage B C D, formed of wire and arranged, with reference to the needle and cloth-plate, as and for the purpose set forth.

143,970.—Bottom for Beds, &c.—JULIUS DEBUSSER, New York, N. Y. Application filed August 8, 1873.

One frame supported on another by springs, each of which is formed of a piece of wire coiled in the middle, with one straight end attached above, the other below. To the top frame is stretched a bottom composed of longitudinal coils of wire worked laterally

into each other, each having a straight longitudinal wire passed through it.

Claim.—The combination of woven-wire bottom I, binding J, lengthwise wires K, upper frame A B, under frame C D, and springs E, constructed substantially in the manner and for the purpose described and set forth.

143,971.—Steam Elevator.—THOMAS W. EATON, Chicago, Ill. Application filed February 19, 1873.

One end of a cord or chain is fastened to mechanism connected with a shaft operating a reversing-lever, and the other end, after passing around sheaves on the main post and on the cage, and also on a bar on the head-piece of the cage, is secured to the said post. The bar is held in place by springs and pawls, so that the cord or chain referred to is straight, but in case the hoisting-rope breaks or becomes slack the cord is pulled from a straight line, and this, acting on the beforementioned mechanism, operates the reversing-lever.

Claim.—1. The cord or cable *o*, when so arranged and connected with the elevating apparatus that through it the reversing-lever of the engine can be operated, substantially as specified.

2. The lever *c d* and bar A, in combination with the bar *e* and cord *o*, substantially as and for the purpose specified.

3. The movable pulley *n*, in combination with the cable *o*, substantially as and for the purpose specified.

4. The combination of the cord *o*, pulley *s*, and latch *r*, for the purpose of operating the reversing-lever of the engine, substantially as specified.

5. The combination of the pulleys *s u*, latch *r*, and cord *v*, substantially as and for the purpose specified.

143,972.—Brick-Machine.—ABIAL ELLIOT and JAMES O. WOODWARD, Taunton, Mass. Application filed April 28, 1873.

Mold-carriage remains stationary until the mold reaches its proper position, and comes in contact with a projection connected with mechanism which engages and moves the carriage forward to deliver the mold under the plunger. An expressing-chamber provided with a pivoted bottom, which swings when obstructed. Also a spring applied to the shaft which operates the reciprocating carriage, so that should a stone obstruct the mold under the plunger the spring will yield to avoid breakage.

Claim.—1. A reciprocating carriage, O, for advancing the empty mold under the expressing-chamber, in combination with mechanism for operating the carriage brought into action by the mold itself on reaching its proper position to be carried forward, substantially as and for the purpose described.

2. The false mold or clog-cutter M, in combination with the expressing-chamber C and fastenings 18, whereby obstructions may be removed from the expressing-chamber by allowing M to drop without taking the chamber apart or removing the plunger, as set forth.

3. The rod *a*, provided with the yielding spring *s* and gear *m* E, in combination with the carriage O, so as to allow it to yield when obstructed, as set forth.

143,973.—Stove-Pipe Thimble.—VALENTINE FATH, St. Louis, Mo. Application filed May 19, 1873.

The thimble is formed in longitudinal sections, which are put together by means of notches in the edges, which allow their intermediate portions to be bent in alternate directions. The thimble has an inner flange to prevent the pushing in of the pipe, and an outer one which prevents the pushing in of the thimble. It is also held in place by springs.

Claim.—1. A thimble, A, formed in sections, and united by V-notches, as and for the purpose set forth.

2. As an improved article of manufacture, a thimble, consisting of the parts A A having outer and inner flanges *a a*^{1}, notches *a*^{2}, springs C, applied as and for the purpose set forth.

143,974.—Horse-Power.—LUTHER R. FAUGHT, Philadelphia, Pa. Application filed October 3, 1873.

The endless chain upon which the circular flanged track is supported has both vertical and horizontal rollers which bear against both vertical and horizontal flanges of the tracks. The beveled wheels, by means of which the power is transmitted to the band-pulley, are arranged within a yoke which can be either vertically or laterally adjusted.

Claim.—1. The horse-power ring-rack, with its draft-levers attached to its outer edge, in combination with the endless intermediate marginal traveling support C, which bears with rolling-surfaces both laterally and vertically between the rack D and the base B, substantially in the manner described.

2. The endless-chain support C, with its horizontal and vertical trains of rollers or wheels *a a*^{1}, substantially as described.

3. The swinging yoke H of the horse-power herein described, in combination with the bearing and stay piece J^3, applied on removable supports of the platform A, within the ring-rack D, substantially as and for the purpose described.

143,975.—Tuck-Creaser for Sewing-Machines.—WILLIAM J. FAULKNER, Chicago, Ill. Application filed May 24, 1873.

The forward end of the spring creasing-arm is coiled and bent to form an inclined space to fit over the lip on the blade, and its end is then extended, forming an arm or lever against which the arm operated from the needle-bar strikes, and as the notched portion engages the fabric the coiled portions of the arm roll somewhat and rub the cloth against the lateral faces of the blade.

Claim.—1. A tuck-marker provided with the blade *a*, and with the yielding and rolling arm B provided with the inclined space *a*^{1}, arranged above the blade *a*, and with the lever B^1 extending laterally from the said arm, substantially as and for the purposes specified.

2. In a tuck-marker, the combination and arrangement of the blade *a*, coiled-spring arm B provided with the inclined and inverted V-shaped notch *a*^{1}, and arm or lever B^1, and arm C, all substantially as and for the purposes specified.

143,976.—Loom-Shuttle.—MILLARD F. FIELDS, Lawrence, Mass. Application filed June 16, 1873.

The spring-piece of the split spindle has an elbow at its free end, which elbow is so arranged between a friction-roll on one side and an india-rubber piece and the spindle-head on the other that it is bent outward to hold the cop when the spindle is within the shuttle, and is relaxed when the spindle is turned up to receive the cop. The degree of curvature to be given to the spring-piece is regulated by an adjusting-screw.

Claim.—The shuttle-spindle A, provided with the spring-piece B with its elbow *f*, in combination with the friction-roll C, the rubber support D, and the adjusting-screw *c*.

143,977.—Kitchen and Ironing Table.—JONATHAN GOOD, Lancaster, Pa. Application filed August 13, 1873.

The body of the table is made with inclined sides, as a box, with openings at the ends for holding an ironing-board. A cover is hinged at one side, on the under side of which rods may be attached for airing the ironed clothes.

Claim.—1. A box-table and ironing-board, J, combined, when said table is provided with a tilting lid or top, with the appliances shown and specified, said box having a drop-lid, E, in front, and the top of the ends C boxed out to receive the said ironing-board J, so as to be covered by the top, which board is made detachable and adjustable, the whole substantially arranged as shown, for the purpose specified.

2. In combination with the under side of the hinged top of said box-table, the bracket-lugs P P, drying-rods Q Q Q, catch-plates M to receive the hooks L on the extension-wings K, together with the turn-holders N, all on said under side of the top, arranged in the manner and for the purpose set forth.

143,978.—Stop-Cock Boxing.—WILLIAM H. GRAHAM, St. Louis, Mo. Application filed September 22, 1873.

The boxing is extensible and has a square chamber containing two valves, which, when closed, rest on a lug in the center and exclude dirt, &c., from the lower part of the boxing. The cap is jointed to an arm which is pivoted in an offset of the case, which incloses the arm when the cap is thrown back.

Claim.—1. The extension stop-cock box E, having lug *f*^{1}, in combination with box A having running slot F and side slots *f*, as and for the purpose set forth.

2. A stop-cock box, A, having square chamber B and valves *b b*^{1}, as and for the purpose set forth.

3. The cap C, hinged to arm *c*^{1}, and offset D, in combination with stop-cock box A, as and for the purpose set forth.

4. The combination of stop-cock box A, cap C, arm *c*^{1}, offset D, and square chamber B having valves *b b*^{1}, as and for the purpose set forth.

143,979.—Folding Seat.—JOHN H. HALL, Chicago, Ill. Application filed January 15, 1873.

The edges of the contiguous slats of the seat and back are curved so as to fit close together, and the seat hinge-pintle is arranged at a point coinciding with the center of the circle of which the curved edges of the slats are a part, and in a line between the upper and lower faces of the seat-slats.

Claim.—In a folding seat provided with a back, the curved edges G and H of the contiguous slats of the seat and back, in combination with the seat hinge-pintle, arranged at a point coinciding with the center of the circle of which the said curved edges are a part, and in a line between the upper and lower faces of the seat and near the said curved edges, substantially as and for the purposes specified.

143,980.—Hydraulic or Air Car-Brake.—WILLIAM M. HENDERSON, Philadelphia, Pa.—Case B. Application filed September 22, 1873.

Dish-shaped diaphragms, with rams or plungers, are directly connected with the brake beams and shoes, and fluid-pressure is applied or relieved through a tube at the bottom of the vessel in which the diaphragms are arranged. An air-vessel is applied to the diaphragm-vessel when an elastic fluid is used to moderate the action of the brake-shoes.

Claim.—1. The combination of dish-shaped diaphragms, with rams or plungers directly connected with the brake-beams and brake-shoes, substantially as and for the purpose described.

2. The combination of the air-chamber H with the vessel A, dish-shaped diaphragms B, and rams D having brake-beams E directly connected therewith, substantially as and for the purpose set forth.

143,981.—Machine for Interlocking Cartridge-Shells with Bullets.—ALFRED C. HOBBS, Bridgeport, CONN. Application filed January 15, 1873.

A hollow rotating mandrel, A, in line axially with two reciprocating punches, G I; a rotatable crimping-disk, B; a cartridge receiver and adjuster, L, and an intermittingly-rotating feed-wheel, E, so combined that the cartridges carried by the wheel are dropped one by one into the receiver, whence, after descending somewhat, punch G forces them into the mandrel, where they are caused to revolve in contact with the crimping-disk, which has been brought to bear upon it.

Claim.—1. The combination of the revolving hollow spindle or mandrel A, crimping wheel or disk B, and reciprocating punches G I, arranged and operating substantially as and for the purpose herein specified.

2. The feed-wheel E, constructed as described, and operated by the ratchet-wheel *f*, pawl *g*, cam plate or arm A, and movable pin or stud *i*, substantially as herein specified.

3. The arm *l*, having a sliding movement on the driving-rod H, in combination with the stops *o* and *r* and spring *p*, substantially as and for the purpose herein specified.

4. The receiver or holder L, constructed and operating substantially as described, in combination with the feed-wheel E and punch G, substantially as and for the purpose herein specified.

5. The combination of the tappets *y* and *z* on the reciprocating rod H, the angle-lever M, catch-bolt N, and vibratory lever O, substantially as and for the purpose herein specified.

143,982.—Automatic Fastening for Sashes, &c.—JOSEPH HOLLELY, Brooklyn, assignor of one-half his right to HAMILTON E. TOWLE, New York, N. Y. Application filed May 16, 1872.

A tripping-lever is arranged so that one end engages with the bolt and holds it in the unlocked position, and the other end projects from the case so that it will come in contact with the object to which it is to be fastened and force it into the case, thereby releasing the bolt and allowing it to be thrown into the locked position by the action of the spring.

Claim.—The combination of the tripping-lever T and spring S with the pivoted bolt or catch B, all arranged and operating substantially as and for the purpose herein specified.

143,983.—Watch-Case Spring.—ULYSSES A. JUVET, Glen's Falls, N. Y. Application filed June 27, 1873.

The two watch-case springs are secured to the plate upon which the movement is fastened.

Claim.—The springs D and E, with grooves *h h* and ears *j j*, fastened to the plate B, substantially as and for the purpose herein before set forth.

143,984.—Water-Wheel.—JOSEPH F. KIRKHART and JAMES RAMSAY, Long Creek township, Decatur county, Iowa. Application filed September 16, 1873.

Claim.—1. The upper and lower tiers of buckets H H^1, separated by a space, S, so that the water, after passing through the upper tier of buckets, falls through the separating space upon the lower tiers of buckets, substantially as described.

2. The cap A, provided with chutes *b* at each of the corners, and gates B and their operating devices C, *c*, *d*, *d*^{1}, E, and F, in combination with wheel G, substantially as described.

143,985.—Punching and Shearing Machine.—JACOB KISSEL, Cassopolis, Mich. Application filed July 18, 1873.

Claim.—1. The combination of the lever B, coupling or connection D, lever G, link J, and rod E, with the frame of the machine and the punch, as shown and described.

2. The link or rod J, operated by the lever G, connection D, and lever B, in combination with the shears O P, as shown and described.

143,986.—Piano-Action.—FREDERICK KOTH, North New York, N. Y. Application filed July 11, 1873.

To get an easy repetition; also dispenses with a hammer-cushion rail.

Claim.—In combination with a piano-forte action, the hammer-butt H, plate L, lever P, screw M, and spring N, when constructed and arranged to operate in the manner and for the purpose set forth.

143,987.—Lining for Horse-Collars, &c.—ISAAC LINDSLEY and JOHN MACKINTOSH, Pawtucket, R. I. Application filed July 24, 1873.

Non-felting hair, curled, stitched or otherwise secured to a backing, the hair to come in contact with the skin of the animal.

Claim.—Linings of harness and other equipments for horses and other animals, made of the materials and in the manner substantially as described.

143,988.—Feed-Regulator for Injectors.—JEREMIAH A. MARDEN, Boston, and THEOPHILUS S. SMITH, Somerville, assignors of one-third their right to THEOPHILUS GILMAN SMITH, Somerville, Mass. Application filed November 30, 1872.

Combines with an injector, a chamber with diaphragm, the rod of which has a rack at its lower end, into which a pinion gears that operates a valve in the feed-pipe. A spring is arranged on the stem between the diaphragm and the rack to balance the pressure, and may be adjusted. As the pressure increases or decreases on the diaphragm the regulating-valve is opened or closed.

Claim.—In combination with an injector, *a*, and pipes *b b*^{1}, the chamber A, diaphragm B, rod C, spring D, rack R, pinion F, shaft F^1, and regulating-valve G, arranged and operating substantially as and for the purposes specified.

143,989.—Feeding Device for Grinding-Mills.—SIDNEY MIDDLETON, Dunkirk, Ind., assignor to himself and JACOB TROOP, same place. Application filed May 24, 1873.

Screw in feeding-tube delivers regularly to stone; hinged wings attached to upper end of screw sweep material into feeding-tube.

Claim.—The central screw feeder E, provided with hinged wing feeders J J, in combination with the spindle G and hopper D, substantially as and for the purpose set forth.

143,990.—Padlock, &c.—DANIEL K. MILLER, Philadelphia, Pa.—Case A. Application filed September 16, 1872.

Two independent sets of vibrating tumblers are operated by a single sliding key, and a dog adapted to notches in all the tumblers is arranged to hold the bolt in the locked position. A spring, attached to one of the tumblers, is arranged to bear against the dog so as to throw it (the dog) into the notches of the tumblers when the latter are properly adjusted. A cam-like incline on one of the tumblers serves to force the dog out of the tumbler-notches and into a notch in the bolt, when the bolt is moved into the locked position.

Claim.—1. The combination, in a lock, of two or more sets of vibrating tumblers, A B, operating independently, and arranged to be adjusted by a single sliding key, and a dog, D, adapted to notches in all the tumblers and to the bolt, as set forth.

2. The combination, with the dog D, of one or more tumblers having springs and cam-like inclines for moving the said dog in opposite directions, substantially as described.

143,991.—Stave-Jointing Machine.—CHARLES MURDOCK, Sarnia, Canada. Application filed January 24, 1873.

A horizontally-moving carriage carries a vibrating vertical stave-clamp, by means of which the edges of the staves are alternately presented to a circular saw.

Claim.—1. The adjustable cross-beam D, in combination with the slotted bar 4 and clamping-frame F, constructed and arranged to operate in the manner substantially as and for the purpose described.

2. The combination, in a stave-jointing machine, of the guide-ways or tracks B B with the traveling carriage C and trucks *b*^{2}, with the upright frames E, F, and P, in the manner and for the purposes substantially as described.

3. The vibrating clamping-frame F, upright frame P, having trucks *b*^{2}, and adjustable slotted bar 4, in combination with the curved transverse track-plate D$'$ on the reciprocating carriage, in the manner and for the purpose substantially as described.

4. The vibrating clamping-frame F, having the pendant 3, in combination with the stop 2, constructed and arranged in the manner and for the purposes substantially as described.

5. The treadles 6 and connecting-rods 6$'$, in combination with the overbalanced pivoted swing-stops N, in manner and for the purpose substantially as described.

6. The cam G and bolt *g*, combination with the slotted pivoted bars H and lug 8 on frame F, in the manner and for the purpose substantially as described.

7. The curved spring clamp-bar O, having the adjustable stop I thereon, in combination with the bilge-block M and clamping device, substantially as described.

8. The combination of the hand-lever K, pivoted to frame F, and lower link J, the connecting-rod *k*, arm K$'$, and upper link J, with the clamp-bar O, when the links J are pivoted to the bar O and form toggle-joints with the lever K and arm K$'$, substantially as described.

9. The automatic vibrating gages L L, when operated by the act of clamping or releasing the stave by means of the hand-lever K, connecting-rod *k*, and tappet-arms R R, and intermediate actuating parts, substantially as described.

10. The presenting the inside of a curved stave on an angle to the edge of the jointing-saw A$''$ by means of the vibrating clamping-frame F and reciprocating carriage C, substantially as described.

11. A stave-machine, such as herein described, and composed of the saw A$''$, in combination with the reciprocating carriage C, carrying the upright frames E, F, and P, with the clamping, holding, gaging, and stopping devices, constructed and arranged to operate as shown.

143,992.—Machine for Sawing Staves.—CHARLES MURDOCK, Sarnia, Canada. Application filed November 19, 1872.

A reciprocating and oscillating table is so arranged in connection with a barrel-saw as to automatically set and feed to the saw the blocks from which the staves are formed.

Claim.—1. The bars or guides *b*^{3}, attached to the forward end of the vibrating table B, and supporting the bolt from which the staves are to be sawed, in combination with the reciprocating carriage C, constructed and operating substantially in the manner and for the purpose described.

2. The combination of the dogs *p*, springs *s*, and presser-bar P$'$ on transverse guard P, supported on vibrating table B, with the rests or posts P$''$ on frame A$'$, substantially in the manner and for the purpose described.

3. The combination of the reciprocating carriage C, friction-rollers *c*, and bumpers *c*$'$ with the grooved sides of table B and stops *b*^{4} thereon, in the manner and for the purpose described.

4. The combination of the revolving pulley 3, having pinion 4, intermediate gear-wheel 5, vibrating gear-wheel 6, friction-pulley 7, and friction-pulley 8 on shaft I, and its train of gear-wheels 9, 10, and 11, with rack-bar C$'$ and reciprocating carriage C, substantially as and for the purpose described.

5. The bolt-holding dogs C$''$, when arranged to be above the top, forward of, and traveling with the reciprocating carriage C, in combination with the vibrating table B, substantially as shown.

6. The friction-clutch wheel 3$''$, revolving cone-pulley 3, and pinion 4 thereto attached, pinions *k*, toothed wheels K, cams G$'$, and friction-wheels A, in combination with the vibrating table B, in the manner and for the purpose substantially as described.

7. The automatic setting device, consisting of the revolving pulley 3, friction-clutch wheel 3$''$, shaft 4, pinion 4$'''$ on shaft 4, gear-wheel 4$''$ on crank-shaft 4$'$, and crank *i*, giving a reciprocat-

ing motion to bumper *j*, in combination with the vibrating arm *f* on shaft I, constructed and operating substantially as and for the purpose described.

8. Regulating the thickness of staves to be sawed by means of the combination of the bumper *j* and vibrating arm *f*, the hand-lever *f*², with its spring-catch *s* and notched plate *f*³, adjustable connecting-rod *f*⁴, and vibrating frame *d*², operating in the manner substantially as described.

9. The combination of the lever O, pivoted bent arm *o* and pawls *r* and *r'*, with the ratchet-wheel I', in the manner and for the purpose described.

10. The shield S, attached to shaft *b*, and arranged, with relation to the saw D', substantially in the manner and for the purpose described.

11. The adjusting of the table B longitudinally upon shaft *b* by the movable boxes *m*, and the shaft *b* and table B vertically by means of the temper screws *n''* and *n'''*, substantially as described, by which means both the diameter of the circle to be sawed in the stave and the table are adjusted to leave a clear space outside the saw-kerf on the upper side of the bolt, as shown.

12. In a stave-sawing machine having an upright shaft and horizontal saw, a step box constructed in the manner, and having the means for removing the step-pin and adjusting the shaft, substantially as and for the purposes set forth.

13. The transverse piece B' of table B, having the projecting edge *b''* and all its parts constructed in the manner substantially as and for the purposes described.

143,993.—Windlass.—WILSON NEWCOMB, Baltimore, Md., assignor of one-half his right to NATHAN W. ALLEN, Boston, Mass. Application filed September 10, 1873.

The cable passes from the chain-head down around a pulley journaled in the sliding frame, from thence backward over another pulley, which is journaled in a frame having elastic side supports, the object being, in cases of sudden strain, that the sheave may have a lengthwise movement.

Claim.—1. The independently-sliding sheave G, frame H, and springs *h'*, in combination with the sliding carriage of the windlass, as set forth.

2. The independently-sliding sheave G and sheave G', operating together, as and for the purposes set forth.

3. In combination with the ratchet-wheel E of the chain-head, upon or within the sliding carriage as described, the arms *b* and *b'*, rod *m*, bell-crank *n*, and link *n'*, the said arms *b b'* being provided with pawls, substantially as specified.

143,994.—Shutter-Worker.—FREDERICK W. NICHOLS, Lynn, Mass. Application filed September 19, 1873.

A pair of self-locking hinges, provided with a horizontal shaft extending through the window-frame, and operated by a knob from the inside.

Claim.—In combination with the blind-hinge C C, a lifting device, L, operated from the inside of the window for raising the blind to unlock the movable from the stationary portion of the hinge, substantially as described.

143,995.—Waste-Cock for Outlet-Valves.—SVEN J. OLSSON, Chicago, Ill. Application filed July 17, 1873.

The nozzle is provided with an escape-valve, which is operated by the expansion and contraction of the pipe attached to it, and is secured to the coupling by bolts passing through ears on each of them.

Claim.—A waste-cock consisting of the combination and arrangement of the nozzle A provided with the ears *a a*, and with the shoulders *a'* and *a''*, and having its inner end screw-threaded, the coupling D provided with the ears *c c*, the tube B provided with the plug B', and having the tubes or ports *s s* therein, the packing *c''*, the nut C, the bolts E E, and the nuts F F, substantially as and for the purpose specified.

143,996.—Door-Gong.—CHARLES W. PENFIELD, New Britain, assignor to JOHN P. CONNELL, Kensington, Conn. Application filed August 12, 1873.

A slide having longitudinal but no lateral motion carries a hooked spring-pawl which catches over the end of a short arm of the hammer-lever, so that when the slide is pulled the gong is sounded, but when it slides back the hook slips over the end of the short arm to resume its place.

Claim.—The combination of the slide *d* having longitudinal but not lateral motion, pawl *e*, and hammer-arm bearing the arm *i*, all substantially as described.

143,997.—Combined Cotton Chopper and Cultivater.—ALBERT F. ROBERTS, Knoxville, Tenn. Application filed March 15, 1873.

The plows and chopping-hoe are hinged so as to have a free vertical and lateral movement.

Claim.—1. The cam H provided with the slot X, in combination with the pin *a*, rods I and K, sleeve *f*, standard L, and hoe M, when arranged and operated substantially as shown and described.

2. The cam H, pin *a*, rods I and K, sleeve *f*, standard L, and hoe M, arranged and operated as shown and described, in combination with the vertical and lateral swinging plows provided with right and left shares, and connected by the bar *i*, substantially as and for the purposes shown and described.

143,998.—Gas-Retort Mouth-Piece.—THOMAS F. ROWLAND, Brooklyn, N. Y. Application filed October 15, 1873.

The tilting-catch has a projection at the end opposite the hook, which projection receives the impact of the cross-bar, causing the catch to fall forward and engage with the bar when the door is closed. The ogee curve of the door provides a cavity for the reception of the guard-lip, and corrects any expansion of the door that would tend to strain the parts or cause leakage.

Claim.—1. The lip B², in combination with the conical bearing-surface B², and projecting forward thereof, so as to serve in guarding the same, substantially as and for the purposes herein specified.

2. The circular door C, formed with an ogee section extending uniformly quite around the center, as and for the purposes herein specified.

3. The tilting catch E E¹ E², in combination with the cross-bar D, and arranged to operate relatively to the door C of the retort and the tightening means G, as herein specified.

143,999.—Paper-Drier.—EDMUND A. SEELEY, Scotch Plains, N. J. Application filed January 27, 1873.

Claim.—1. An apparatus for drying paper boards, composed of the following elements, viz., a drying-chamber, a rack which in either of its extreme positions closes its passage-way in the front wall of the drying-chamber, and a tramway, or its equivalent, extending beyond the drying-chamber, to facilitate the transit of the rack.

2. The rack D, the end board D¹ of which has a hinged flap, *d'*, substantially as and for the purpose specified.

144,000.—Extracting Oleine from Fatty Matters.—CHARLES F. A. SIMONIN, Philadelphia, Pa., assignor to WILLIAM ADAMSON, same place. Application filed October 1, 1873.

Claim.—The process, substantially as herein described, of separating the oleine from the stearine of fatty matter through the agency of hydrocarbon.

144,001.—Fire-Engine.—JAMES A. SINCLAIR, Bridgeport, Ohio. Application filed February 25, 1873.

The engine consists of four cylinders connected at their bottoms by pipes with a cylinder having an induction pipe, and at their upper ends with pipes which center together in an air-chamber. The engine is arranged within a water-tank, which is secured to a frame that can be attached to a carriage.

Claim.—The engine consisting of the cylinders *c c*, pipes *d i l*, air-chamber *n*, and hand-levers *o*, when all are combined to operate substantially as described.

144,002.—Mouth-Piece for Steam-Boiler Furnaces.—CHARLES STEWART, Worcester, Mass., assignor of one-half his right to WILLIAM ALLEN, same place. Application filed October 1, 1873.

Claim.—1. The mouth-piece E E¹ for steam-boiler furnaces, the parts thereof being constructed and combined with the furnace-front D, substantially as herein shown and described.

2. The combination, with the front D in a steam-boiler furnace, of a sectional mouth piece, comprising two or more sections, the edges of which are matched to each other with flanges and grooves, whereby, while the parts are held firmly to each other, either section can be removed without disturbing the other section, substantially as and for the purpose set forth.

144,003.—Extension-Rule.—EMERY D. WATERBURY, Mason City, Iowa. Application filed July 21, 1873.

Two rules, one slotted, slide by each other, guided by a clamp at the end of each. A clamp-screw holds them together when slipped out of the clamps, and allows radial and angle adjustment. In the outer end of each is a knife-hinged apur.

Claim.—The manner of constructing a combination extension-rule with clasps A A and hinged apur E, substantially as described in the foregoing specification and accompanying plate.

144,004.—Spinning-Ring.—JOSEPH W. WATTLES, Canton, Mass. Application filed September 24, 1873.

The curved bearing-surface above the race of the ring is for the yarn passing through the traveler to be borne against, so that sufficient friction may be produced upon it to secure compact winding of the bobbin. The recesses serve to clear the yarn of motes or lumps.

Claim.—1. A spinning-ring having its circular projection *b* made or provided with the curved bearing-surface *c*, as described, extending from the top of the projection to the inner edge of the race *a*, and to operate in connection with a traveler, as set forth.

2. A spinning-ring made or provided with the traveler-supporting projection *b* and the curved bearing-surface *c*, and with one or more recesses, *e*, arranged in the latter, all being and operating substantially as specified.

144,005.—Locomotive Air-Brake.—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Application filed July 18, 1873.

The drive-wheels of a locomotive are combined with brake-shoes and a brake-cylinder, this having a pipe-connection from the main reservoir, and the piston-rod connected to levers which actuate the shoes. The steam-pipe is provided with a three-way cock and a double pipe, so that steam may be taken from the reservoir or the boiler direct. Cocks in the brake-cylinder are provided to let off the steam.

Claim.—1. In combination with the drive-wheels of a locomotive, the brake-shoes *d*, a brake-cylinder with a pipe-connection from the main reservoir, and a piston-stem connection to the levers which actuate the shoes, substantially as set forth.

2. The brake-cylinder *b* operating by atmospheric pressure, the locomotive drive-wheels B, and brake-shoes *d*, in combination with each other and with the interposed piston-stem and beat-lever connections, substantially as set forth.

3. In combination with a locomotive-boiler and drive-wheels, the steam-pipe *m*, three-way cock *g*, double pipe *s*¹, brake-cylinders *b*, cocks *c*, and lever-connections to the brake-shoes, substantially as set forth.

144,006.—Steam and Air Brake.—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Application filed July 24, 1873.

A triple valve is arranged with a line of brake-pipes, auxiliary reservoir, and brake-cylinder, so that by the introduction of compressed air or steam the auxiliary reservoir will be charged and the brakes let off, and when the air is let off from the pipes an opening is made from said reservoir to the brake-cylinder.

Claim.—1. The combination of the triple valve A B C, seated as described, the valve-case connection E, above the valve A, to an air-supply pipe, a connection, F, between the valves A B with an auxiliary reservoir, a connection, G, below the valve B, with the brake-cylinder, substantially as set forth.

2. A triple valve arranged, in combination with a line of brake-pipe, auxiliary reservoir, and brake-cylinder, so that by the introduction of compressed air or steam the auxiliary reservoir will be charged and the brakes let off, and when the air is let off from such pipes an opening will be made from the auxiliary reservoir to the brake-cylinder, substantially as set forth.

144,007.—Railway-Switch.—EDWARD P. WHEELER, Corinth, Miss. Application filed September 6, 1873.

The switch is shifted by the approaching train by the contact of a projecting arm from locomotive or car, which depresses a vertical lever, said lever imparting motion to the switch-rails through toggle-joint connections with the movable rails.

Claim.—The double-crank lever I', connected with lever E' by the toggle-joint L, in combination with the pivoted rod N, toggle-joint H, pivoted rod G, and the double-crank lever I, connected with the lever E by the toggle-joint J, substantially as and for the purpose hereinbefore set forth.

144,008.—Car-Coupling.—WILLIAM M. WERWELL, Portland, Me. Application filed May 1, 1873.

The pin is grooved, and is held from being entirely extracted from the draw-head by a bolt working in the groove. The pin-hole is enlarged at its rear and the enlargement filled by a removable plate that in case the pin should become bent so as not to be readily withdrawn, the difficulty is overcome by the removal of this plate. The screws which hold the plate in position also limit the motion of the spring-bolt which supports the pin.

Claim.—1. A draw-bar of a railway-car, constructed and provided with the axial or central bore C and bolt F and spring H, and the pin E, with the plate *d*, for permitting the removal of a bent pin, substantially as and for the purposes stated.

2. The pin E, with its channel or groove *e*, in combination with the plate *d*, draw-bar A, and spring-bolt F, substantially as and for the purposes stated.

144,009.—Manufacture of Iron and Steel from Granulated Iron.—CHARLES WOOD, Tees Iron Works, Middlesborough-on-Tees, England. Application filed September 13, 1873.

The charge is worked in the ordinary rotary puddling-furnace, by which means the temperature to which the granules are submitted is uniform. Every portion of the metal is in succession brought in contact with the lining, and in turn exposed to the action of the flame.

Claim.—The improvement in the art of puddling granulated iron, consisting in causing the granules to rotate consecutively while exposed to flame, substantially as before set forth.

144,010.—Forming Metallic Cases for Cartridges, Caps, &c.—STEPHEN W. WOOD, Cornwall, N. Y. Application filed April 17, 1873.

Forming cases for cartridges by electro-deposition of the metal composing it, upon or in a form or mold of the required size and shape.

Claim.—1. The process of forming metallic cases for cartridges and other articles by the electro-deposition of the metal of which it is composed, substantially as herein specified.

2. A metallic case for a cartridge formed by the electro-deposition of the metal of which it is composed, as a new article of manufacture.

144,011.—Cartridge for Fire-Arms.—STEPHEN W. WOOD, Cornwall, N. Y. Application filed March 18, 1873.

Fibrous body and base coated with metal.

Claim.—A case for a cartridge composed entirely or in part of paper or other fibrous material, covered with metal, substantially as herein set forth.

144,012.—Metallic Cartridge-Case.—STEPHEN W. WOOD, Cornwall, N. Y. Application filed August 29, 1873.

Hard-metal re-enforce, enveloped or covered by electro-deposition, which forms the cylindrical body.

Claim.—A metallic case for a cartridge re-enforced with and having a hard-metal base in intimate connection and contact therewith, as herein described.

144,013.—Railway-Car Brake.—LUTHER ADAMS, Mattoon, Ill. Application filed July 12, 1873.

A friction-wheel, notched to catch the axle and slotted to receive the brake-chain, is borne against the car-axle by springs, upon which the bearings of the friction-wheel are mounted.

Claim.—1. The combination, with the brake-chain, of a notched friction-disk, E, spring-plate H F, lever M, and spring K, having a stirrup or bearing-point, L, substantially as shown and described.

2. The combination, with the disk E and springs H K, of the pivoted block Y having lug Z, the plate W carrying block X, and the sliding bar or bumper S, substantially as shown and described.

3. The combination of the hand-wheel *a*, bevel-gears *c d*, feathered bar S, finger *e*, and spiral spring W V, as and for the purpose specified.

144,014.—Railway-Switch.—GEORGE F. BEATTY, Boston, Mass. Application filed August 16, 1873.

An arrangement of main rails and guard-rails at a switch-junction, designed to prevent the train from getting off the track, whether the switch be properly adjusted or otherwise.

Claim.—The main rails A, having the outward bend C, the inside long guard-rails B, having the inward bends F, and the short guard-rails D and F, and the switch-rails I G, all combined and arranged substantially as specified.

144,015.—Car-Coupling.—WILLIAM CHARLES BROOKS, Stoneham, Pa. Application filed April 19, 1873.

The lower side of the draw-head is in the form of a lever, and is held in place so as to force the hooked end of the coupling-bar to engage with the hook on the upper side of the mouth of the draw-head. Uncoupling is effected by means of a pin operated by a lever extending to the side of the car.

Claim.—The draw-head having subjacent lever D E, spring F, and pin H, combined with a hook-link, G, to allow the latter to enter, be caught, held, and released, in the manner described.

144,016.—Felt Roofing.—EDWARD CHURCHILL, St. Thomas, Canada. Application filed August 22, 1873.

The roofing felt or paper is saturated with a mixture of about three parts paraffine to one of coal-tar.

Claim.—1. As a new article of manufacture, a roofing paper or felt saturated with paraffine and coal-tar, substantially as herein described.

144,017.—Middlings-Purifier.—WILLARD A. CLARKE, Milwaukee, Wis., assignor of one-half his right to E. P. ALLIS & Co., same place. Application filed June 19, 1873.

Construction and arrangement of devices for regulating and exhausting the air-currents that act upon the middlings in different parts of the machine.

Claim.—1. In combination with a bolt-reel, a series of automatic valves, applied and operating substantially as shown, to control the admission of air through the bolt-cloth into the reel, and a fan arranged to exhaust the air from the interior of the reel, substantially as shown and described.

2. The reel B, provided with the inside cylinder or lining *i*, having holes *j* and valves *k*, in combination with the stationary cam *n*, or its equivalent, for operating the valves.

3. In combination with the reel provided with the lining and valves, as set forth, the surrounding casing *g*, provided with the opening A, and a fan arranged to exhaust the air from the reel, as set forth and shown.

4. In combination with the body A, provided with the fan C, passage *c*, vacuum-chamber *d*, passage *e*, and casing *g*, with its opening A, the reel B, provided with the lining *i* and automatic valves *k*, substantially as shown and described.

5. The bolt-reel inclosed within the tight casing *g*, having the opening A, in combination with the passage H, communicating with said opening, and the fan C, arranged to exhaust the air from both the reel and the passage, said parts being constructed and arranged as shown, so that the air-currents act upon a small portion only of the cloth at one time.

144,018.—Grain-Basket.—GEORGE P. COAN, Wyandotte, Mich. Application filed July 14, 1873.

The basket is made of upright splints, an outer top wooden hoop, an inner top iron hoop, and an outer central iron hoop. The lower ends of the splints are secured between two metallic disks.

Claim.—As a new article of manufacture, the basket herein described, wherein the splints A, wooden hoop *a*, wire hoops *b c*, and metallic disks *c d* are arranged and secured together, as described.

144,019.—Blind-Stop.—JOHN H. CRAMPTON, Norwich, Conn. Application filed October 2, 1873.

A small rack-bar is attached to the operating-rod, and is moved by turning an endless screw.

Claim.—The frame or housing D, endless screw E *e*, guided rack-bar G *g*, and link H, combined and arranged as and for the purposes herein specified.

144,020.—Spring for Chairs, &c.—WILLIAM T. DOREMUS, New York, N. Y. Application filed September 27, 1873.

A spring is composed of two rubber blocks having a U-shaped bar passing in one direction and interposed between the two blocks, and another U-shaped bar encircling both blocks and passing in the opposite direction, and the blocks held together by a yoke and bolts connecting said yoke with the outer U-shaped block.

Claim.—An improved spring, formed by the combination with each other of the two rubber blocks A, the U-bar B interposed between the blocks A, the U-bar C passing around both blocks A, the yoke or plate D, and the bolts E, or equivalent, substantially as herein shown and described.

144,021.—Umbrella.—James H. Dugan and George Moncrief, Stoneham, Mass. Application filed July 26, 1873.

The notch-pieces holding the ends of the ribs and stretchers revolve between stationary collars upon the stick and runner so as to allow the frame to rotate.

Claim.—The rib and brace notch-pieces B and G, stationary collars D, E, I, and J, stem K, and runner H, all combined and arranged substantially as and for the purpose set forth.

144,022.—Extension-Trunk.—Gustav Engelman, New York, N. Y. Application filed September 13, 1873.

Claim.—1. The hinged extension-pieces C D, and the corner-blocks E E, constructed as described, in combination with the parts A B of an ordinary trunk, substantially as herein shown and described.

2. The hook-hinges I and eyes J, for connecting the top of the trunk to the lower part or the extension, as required.

3. The lock-hasp G made with two keepers to adapt it for use either with or without the extension, substantially as herein shown and described.

144,023.—Machine for Cutting Cloth.—Nathaniel C. Fluck, Gloucester, England. Application filed March 22, 1873.

The cloth to be cut in stripes or samples is placed on a board which slides between two ribs on a bed-plate. The board is moved by a ratchet pivoted in a shoe which slides on a metal bar affixed to one edge of the movable board. The ratchet is operated by means of a pivoted bar connecting its long arm to a transverse piece that serves as a guide to knife, and which is connected at each end by hinged arms with the bed-plate. The guide is swung up and forward, and its connecting-rod causes the ratchet to nip the bar, and moves the board until the shoe carrying the ratchet strik-s a stop, when the guide is swung back and down on the cloth to hold it while being cut.

Claim.—1. The combination of the bed-plate A, movable board B, guide C, connecting-rod O, and pawl D, substantially as described.

2. The combination of the bed-plate A, movable board B, guide C, connecting-rod O, and pawl D, of an adjustable stop, E, and a scale, F, substantially as specified.

3. The combination of the shoe Q, pawl D, spring R, and the rod O with the movable board B, the cutter-guide C, and the hinged arms H, substantially as specified.

144,024.—Steam-Generator.—Elbridge Goddard, St. Louis, Mo. Application filed May 24, 1873.

The steam-generator is provided with inclined circulating-pipes connected at the front and rear as near the bottom as possible, whereby a constant and rapid circulation is kept up, depositing the mud and sediment in the drums.

Claim.—The combination, with a steam-generator, of the circulating-pipes C C′ and the connecting-pipes c c' c'' c''', the said circulating-pipes being arranged inside the fire-walls, and having their rear ends lower than their forward ends, and their connection with the generator being such that they take the water from and introduce it into the generator at the ends, and as near the bottom thereof as possible, substantially as shown and specified.

144,025.—Accordion, &c.—Fendrick Goetze and Donat Müller, New York, N. Y. Application filed June 21, 1873.

A slider, arranged to range the length of the instrument, has a loop to embrace the wrist of the performer.

Claim.—The combination of sliding holders M with the key-boards of a wind-instrument in which the bellows is actuated by the instrumentality of the key-boards, substantially as specified.

144,026.—Toy Horn.—William A. Harwood, Brooklyn, N. Y. Application filed September 6, 1873.

The parts of the mouth-piece and reed-block are of cast metal, and adapted for readily putting together, the reed being fastened in place by forcing on the outer cap, thus binding the metal about the base of the reed.

Claim.—1. A mouth-piece for horns, composed of the inside piece A B and outside piece G H, constructed and combined substantially as specified.

2. The slit C, arranged in the part A of the reed-piece relatively to the part B for securing the reed, and formed in the casting of the said piece, substantially as specified.

3. The reed secured in the slot of the reed-piece by compressing the metal on the reed by the part A forced on said reed-piece, substantially as specified.

4. The combination of the reed-piece A B, outside piece G H, and the reed D, substantially as specified.

5. The mouth-piece cast with a socket, I, and attached to the horn-tube F by forcing the latter into said socket, substantially as specified.

144,027.—Desk-Cover.—Jacob Heymann, Boston, Mass. Application filed February 18, 1873.

The wooden slats are connected on their inner sides by strips of sheet-steel, and are rendered capable of being moved backward and forward by means of grooves or guides on the sides of the desk.

Claim.—In the manufacture of semi-flexible covers for desks and other similar articles of furniture, the combination of the slats or strips A^1, strips of sheet-steel A^2, and grooves B^2 or guides formed in or affixed to the sides B^1, substantially as set forth.

144,028.—Billiard-Table Leveler.—David H. Hill, South Chester Pa. Application filed September 6, 1873.

Claim.—The billiard-table leveler, consisting of bolt-screw C, having button d, and hand-wheel D, socket B, and foot A provided with rim or flange a, substantially as and for the purpose described.

144,029.—Railroad-Rail.—Asa Johnson, New York, N. Y. Application filed March 12, 1873.

The center bar A is of steel, the side bars B B of rolled iron, and the base C is cast on them. The bars break joints, and are secured by bolts and nuts, the whole forming a continuous compound rail.

Claim.—A railroad-rail formed of the center bar A, side bars B B, and base C, constructed and arranged substantially as herein set forth.

144,030.—Pyrotechnic Signal.—Alexandre Lamarre, Paris, France, assignor to Gratiot Washburne. Application filed July 26, 1873.

Linseed-oil reduced by boiling to a glue is united with the chlorates and other substances used to produce different-colored light for use in pyrotechnic signals.

Claim.—The combination of the within-described linseed-glue with the chlorates and other chemicals usually employed in the production of compositions of matter for producing signal-lights and other pyrotechnic lights, substantially as and for the purpose herein set forth.

144,031.—Trimming.—Welwood Murray, New York, N. Y.—Case A. Application filed May 24, 1873.

Claim.—As a new article of manufacture, a trimming of muslin or other suitable material, consisting of a strip, either single or double, with groups of cross-plaits B and plain portions C, the plaits being at a right or any other angle to the strip, substantially as specified.

144,032.—Trimming.—Welwood Murray, New York, N. Y.—Case C. Application filed May 24, 1873.

Side-plaited trimming having the plaits folded in different directions at the margins, and with or without puffing between the edges in the center of the trimming.

Claim.—As a new article of manufacture, the trimming herein described, consisting essentially of the reverse-side plaits, either with or without the puffs, substantially as described.

144,033.—Trimming.—Welwood Murray, New York, N. Y.—Case D. Application filed May 24, 1873.

The box-plaits on one side of the trimming are midway between those of the other side, and the two side plaits that form one box-plait on one margin are merged into two box-plaits on the other margin.

Claim.—As a new article of manufacture, the trimming herein described, consisting essentially of the reverse box-plaits, either with or without the puffs, substantially as shown and set forth.

144,034.—Car-Coupling.—Laurent Ruel, St. Johnsbury, Vt., assignor to himself and Jullien Demers, same place. Application filed August 27, 1873.

The pin is suspended from a yoke which surrounds the draw-head, and is held down by a spring. When set for automatic coupling, a spring depending from the yoke on one side rests upon a ledge or projection, G, on the side of the draw-head, and is forced from its position by the opposing draw-head striking a slide, H, a projection, K, on this slide forcing the spring from the ledge.

Claim.—The yoke C, spring E, coupling-pin D, catch F, shoulder G, slide-rod H, cam K, spring I, chain or line c, and the windlass L, combined with the platform A and the draw-bar B, substantially as, and to operate as, specified.

144,035.—Fence-Post.—John Scott, Antwerp, N. Y., assignor of one-half his right to Robert Gill, same place. Application filed April 5, 1873.

A fence-post consisting of a base-board transverse to the fence; two inclined pieces, one secured to each extremity of the base, crossing, and pivoted near their tops. Two half-length pieces are secured a third of the distance from each extremity of the base, both crossing, and pivoted at their centers, and secured at their tops at about the middle of the first-named inclined pieces, with a horizontal piece resting on their tops, and secured to the said longer inclined pieces.

Claim.—A fence-post formed by the combination of the inclined braces A A, crossing near their top, the brace C, the cross-braces D D, and sill B, when constructed and arranged substantially as shown and described.

144,036.—Wrench.—Elphalet S. Scripture, Brooklyn, E. D., N. Y. Application filed May 2, 1873.

The nut is made of hardened steel, and provided with notches in its periphery, forming cutting-lips. The main bar is made of soft metal, so that the strain on the nut will cause it to cut into and take a firm hold on the bar.

Claim.—1. In combination with the jaw having the hardened-steel nut or screw E, the soft-metal bar A, as and for the purpose set forth.

2. The relief-groove f, formed in the face of the soft bar A, in combination with the screw or hard nut E, as and for the purpose set forth.

3. In combination with the rack-bar A, the nut E, provided with the grooves or notches A forming the cutting-lips, as shown and described.

144,037.—Cotton-Planter.—Pierpont Seymour, East Bloomfield, N. Y. Application filed June 27, 1871.

The seed-box is provided with vertical hinged agitators that reach from the top to the bottom, and fill the space transversely. Below these is a bar having fingers extending upward into the seed-box, which bar has a vibrating motion.

Claim.—The plate or plates B, pivoted at a', and depending within the hopper A, in combination with each other and with the stirring-rod C and its pins b b, suspended beneath the hopper by the rods c c, the whole arranged and operating substantially as and for the purpose described.

144,038.—Car-Coupling.—Xavier St. Pierre, Ophir City, Utah Ter. Application filed August 30, 1873.

The jaws are held in contact with the head of the coupling-bar by means of a bifurcated locking device, the arms of which surround the draw-head. The coupling device is raised by a bell-crank lever, which is held by a catch projecting from a shaft which has an arm near its lower end, so connected with one of the jaws that when the locking device is raised one of the jaws will be drawn aside to allow a free egress of the coupling-bar.

Claim.—1. The combination of the locking device K with the coupling-jaws B and the coupler J, substantially as specified.

2. The combination of the elbow-lever O, catch R, rock-shaft S, and arm T with the locking device K and one of the coupling-jaws, the arm T being connected to jaw by a rod and link, all substantially as specified.

144,039.—Apparatus for Extinguishing Fire in Buildings.—John D. Sutter, Chicago, Ill. Application filed February 7, 1873.

Water is introduced into a stand-pipe from a main in the street, or from a fire-engine, through a coupling near the ground, and is admitted to horizontal branch pipes passing through the floor-joists, and provided with regulating-valves, connected by levers and cords with operating-cranks located in a locked closet near the ground.

Claim.—The arrangement of the cocks C, levers b d, cords D, shaft e, and crank f, with relation to the branch pipes A', box E, and stand-pipe A, having a T-coupling, a, as and for the purpose set forth.

144,040.—Horse-Power.—John S. Tadlock, Belmont, Tex., assignor to himself and J. M. Howell, same place. Application filed August 16, 1873.

The endless chain, inclosed within two cog-wheels and drums, rests upon the central drum, the cogs of which engage with the cogs of the former, permitting the endless chain to tilt to different inclinations.

Claim.—1. The combination of the endless chain A, drums B, wheels C and D, and the pinion-wheels G, shaft F, and pulleys H, substantially as specified.

2. The combination of the drum E with the wheels D and chain A, substantially as specified.

3. The endless chain A, drums B, and wheels C, combined in a truck, and arranged for shifting from side to side, and to different inclinations on the wheels D, substantially as specified.

144,041.—Bobbin-Holder for Spooling-Machines.—Asel M. Wade, Lawrence, Mass. Application filed September 8, 1873.

The trough holds a bobbin to be unwound, and the yarn from it passes up and against one side of the friction-arm, which can be turned on its pivot to vary the angle at which the yarn is drawn off, and consequently its tension. By passing the yarn down through the slot in the bottom of the trough, and then up, its tension is further increased.

Claim.—1. The combination of the trough A and the adjustable friction-arm B, all being substantially as specified.

2. The spooling-machine trough A, made or provided with the slot d through its bottom, such being as and for the purpose as explained.

3. The combination of the trough A and its supporting-arm C, pivoted together and provided with the clamp-screw e and nut f, as set forth.

144,042.—Suspenders.—Joseph W. Wattles, Canton, Mass. Application filed September 29, 1873.

The front button-straps of suspenders are each composed of two straps. The inner end of each strap passes through a loop on the shoulder-strap buckle, and is attached to the cross-bar of a friction-slide upon the other strap, whereby the button-straps are "compensating" and adjustable in length.

Claim.—The friction-slides B B′ and the two straps A A′ of a pair of front button-straps, arranged and combined together and with the buckle C of the shoulder-strap, substantially in manner and so as to operate as specified.

144,043.—Stove-Damper.—Rumen Worster, Central Falls, R. I., assignor of one-half his right to Nathan N. Knight, same place. Application filed August 23, 1873.

A collar is provided on the inner edge of the rim of a damper, and there are two series of apertures or gas-escapes, one on each side of the collar. An adjustable check-piece holds the rim in the pipe by pressure on its inner surface, and also serves as a stop to the central disk or damper proper.

Claim.—1. A brace-rimmed damper having two series of gas-escapes, E and F, upon the inner and outer circle respectively, substantially as and for the purposes specified.

2. The combination of the rim A, collar D, disk C, and check-piece G, the whole constructed, arranged, and operating in the manner substantially as described.

144,044.—Harrow.—Milas K. Young, Glen Haven, Wis. Application filed August 23, 1873.

Two flat pulverising-bars in front and one wide bar in the rear are joined by chains, to which intermediate bars are hung, having inclined cutting-teeth, the ends of the toothed bars alternately approaching each other. The seat is borne upon a spring-board attached to the front and rear pulverising-bars by standards.

Claim.—1. The pulverizer-bars A G, oblique bars B C D E, cutters F, and draft-chains L, combined as and for the purpose described.

2. The seat K, spring-board L, and the standard M, arranged, in combination with the front bar A and the hind bar G, substantially as specified.

144,045.—Printing-Telegraph.—George L. Anders, Boston, assignor to E. B. Welch, Cambridge, Mass. Application filed December 18, 1872.

Independent type-wheel and printing-escapements actuated by one mainspring. Type-wheel controlled by polarized electro-magnet charged by currents of alternating polarity. Magnet controlling printing mechanism remains charged during the rapid alternations, but allows such to act only during a complete cessation of current.

Claim.—1. A polarized electro-magnet for releasing, in a step-by-step motion, the type-wheel impelled by mechanical power, by passing currents alternating in their polarity rapidly through it, in combination with an electro-magnet controlling the printing mechanism, and placed in the same circuit with the polarized electro-magnet and excited by the same currents, and arranged to attract and hold its armature until a sufficient interval between the pulsations occurs to release the arm, and allow the press mechanism to operate and effect an impression, substantially as described.

2. In a printing-telegraph, the combination, with the printing mechanism and the type-wheel mechanism, of the one mainspring actuating both, substantially as and for the purpose set forth.

3. The arrangement of springs X′ X″, of brass or other non-magnetic material, of suitable strength or thickness, on each side of the polarized armature X, for the purposes set forth, substantially as described.

4. The sliding unison bar B, having serrated edges, in combination with the latch a, pivoted spring-lever f, and spring e, all arranged and operating substantially as described.

144,046.—Flue-Cleaner for Boilers.—Jacob Arbenbuter, Petroleum Centre, Pa. Application filed September 11, 1873.

The scrapers are hinged at one end to the sliding cap; in the middle by knuckle-joints to the shaft. In pushing the scraper forward through the flue the friction and the action of the knuckle-joints cause it to expand against all sides of the flue.

Claim.—The combination of the scrapers C hinged at one end to the sliding cap B, and the knuckle-joint s hinged to the shaft A and the scrapers C, substantially as and for the purposes set forth and described.

144,047.—Steam-Generator.—William C. Baker, New York, N. Y. Application filed July 3, 1873.

The water passes from circulating-pipe through the coil in the furnace into the water and steam drum, where there is space for the steam to separate; then circulates downwardly to the lowest and coolest end of the drum, and then by pipes back to the circulating-pipe. The coil rests upon a hollow bar, through which air circulates to keep it cool.

Claim.—1. The arrangement of the water and steam drums, circulating-pipes b, feed-water and circulating pipe c, pipe d, and coil e within the fire-chamber, and connecting with the drum a, substantially as and for the purposes set forth.

2. The hollow bar r, through which the atmosphere passes, and which separates the fire-space and rests upon the division-wall o of the ash-pit n, in combination with the circulating-coil e, that rests upon said bar r, and is connected with the water and steam drum, substantially as and for the purposes set forth.

144,048.—Valve-Motion for Gates and Hydrants.—Perkenah Ball, Worcester, Mass. Application filed October 9, 1873.

Claim.—1. The method, substantially as described, of operating a valve—that is to say, by means of a right-and-left-hand screw, and one or two pairs of arms or levers, G, or G and G′, and nuts g g', for the purposes set forth.

2. The combination of a valve, F, and its actuating mechanism with the valve-seat, in such manner that the movement of the former from or toward the latter shall be at right angles to the face of the latter, and with a regularly increasing and decreasing velocity during said movements, for the purposes described.

144,049.—Spark-Arrester.—James Bardsley, Akron, Ohio. Application filed September 30, 1873.

The lifting-pipe in the smoke-chamber, the tapering pipe at upper end of smoke-pipe, and the inverted cone are provided with laterally-arranged studs to break the ascending sparks and cinders and deflect them.

Claim.—The combination of the inverted cone E, supported above the tapering pipe D, and the lifting-pipe B located at the base of the smoke-stack C, when the surfaces of all are provided with alternately-arranged studs *a*, in the manner and for the purpose specified.

144,050.—Smut-Mill.—Heman A. Barnard, Moline, Ill., assignor to The Barnard and Leas Manufacturing Company, same place. Application filed June 25, 1873.

Arrangement of the trunk, valve, chamber or screen-box, and scraper with the scouring-case and surrounding air and dust space. Deflecting shield prevents screenings from being drawn up into fan-chamber.

Claim.—1. The trunk F, valve Y, opening G, and chamber A, arranged, in relation to the space U and scraper I, substantially as and for the purpose set forth.

2. The shield N, of semicircular form, fitted in the opening M, and extending downward nearly to the scraper I in the chamber A, substantially as and for the purpose specified.

3. The combination, with the chamber or screen-box A and its interior revolving scraper I, of the separating-trunk F, discharge-box K, and fan L, substantially as and for the purpose herein set forth.

144,051.—Can-Opener and Pipe-Cutter.—Daniel A. Barnes, Chicago, Ill. Application filed October 22, 1873.

The end of the cutter-handle carries projecting points, which are made to rest in grooves in a concave shield. The cutter-blade projects outwardly from the handle, at a short distance from the end which serves as a fulcrum. The shield passes over the surface of the can or pipe to be cut, serving constantly as a movable fulcrum to the knife as it passes around the cylinder in cutting.

Claim.—1. The cutter provided with the projecting bearing-points and the centrally-arranged slot, as described.

2. The slotted shield adapted for movement over the can or cylinder, as described, for the purpose set forth.

3. The combination of a cutter having bearing-points and a blade, arranged substantially as described, with a shield having bearing-sockets and a fastener, substantially as described.

144,052.—Draft-Equalizer.—John P. Beckenbaugh, Springfield, Ill. Application filed May 26, 1873.

Claim.—In a three-horse equalizer, the angle-plates B B′, having oblique branches attached to the whiffletree in the direction of lateral strain on each side, the chain-pulleys and the journal-pins *e* passing through the angular portion of the plates B B′, with or without the division-plates E, said parts being constructed, combined, and arranged as specified.

144,053.—Ice-Cream Freezer.—Rudolph P. Beil, Peoria, Ill. Application filed August 9, 1873.

Claim.—In a revolving ice-cream freezing apparatus having double walls A *a*, the cream-vessel D having the shaft E attached to the bottom, and provided with socket to receive the nipper *h*, in connection with braces C and covers B, H, and G, provided with loop *i* to receive the scraper F, all constructed and arranged to operate as shown and set forth.

144,054.—Ventilator and Pipe-Hole Plate for Tents.—Robert Brien and William Brien, Jersey City, N. J. Application filed September 20, 1873.

Claim.—The ventilator or pipe-hole plate B, valve F, springs G, and cord H, combined and attached to a tent-cloth, or to a piece of cloth to be sewed to the tent-cloth, substantially as specified.

144,055.—Watering Streets and Roads.—Isaac Brown, Edinburgh, North Britain. Application filed May 5, 1873.

Claim.—A soft-metal punctured pipe, A, arranged adjacent to a street-pavement, and protected by slotted guards D, as specified.

144,056.—Middlings-Purifier.—Clark S. Fuller and Harvey J. Burdick, Oswego, N. Y. Application filed October 6, 1873.

Air-chamber with openings and valves for admission of air into the bolt at various points around its circumference. Diaphragm for arresting and deflecting any light particles of the middlings that may have been partly raised by the air-current back on the bolt-cloth, while the fibrous particles are forced through the diaphragm or carried around the edge thereof by the air-current. Brushes for clearing the meshes of the bolt-cloth and diaphragm.

Claim.—1. A reel-bolt arranged within a casing having double walls, forming an air-chamber between them, with the inner walls provided with openings arranged around the reel, for directing air into it, substantially as and for the purpose hereinbefore set forth.

2. The arrangement, within a reel-bolt having an air-current through the same, of the diaphragm E, of less diameter than the bolt, substantially as and for the purpose hereinbefore set forth.

3. The combination, with a reel-bolt and diaphragm, E, of a clearing-brush, F, loosely suspended from the shaft, so as to sweep the face of the diaphragm, substantially as herein before set forth.

4. The combination, with a reel-bolt, of a clearing-brush, G, loosely suspended from the reel-shaft, so as to sweep the cloth of the bolt, substantially as hereinbefore set forth.

144,057.—Device for Forming Water-Traps.—William A. Butler, New York, N. Y. Application filed October 7, 1873.

The faces of the roller C and the former or bending-mandrel A are concave or convex, or vice versa. The gear-teeth *b* on the roller engage with the teeth of the stationary semicircular rack B, producing a drawing-friction on the surface of the blank while bending it over the former.

Claim.—The machine for bending semi-tubes into shape for water-traps, &c., and consisting of the semicircular block A, toothed roller C, stationary gearing B, and fork or lever D, the edges of the block A and roller C being of such form that a semi-annular space, *d*, is formed between them, all operating substantially as described.

144,058.—Power-Hammer.—John C. Butterfield, Chicago, Ill. Application filed September 11, 1873.

The helve is bored longitudinally its entire length, and from this bore laterally to the tubular springs, for the purpose of introducing currents of air through the springs, which are either separately adjustable or not. The spring D is designed to assist the spring E in raising the hammer. The helve oscillates independent of the yoke.

Claim.—1. The combination of the independently-vibrating helve A, oscillating beam C C′, and diagonally-arranged springs D and E, substantially as and for the purpose specified.

2. The combination of the independently-vibrating helve A, oscillating beam C C′, and springs D, E, and F, either separately adjustable or not, substantially as and for the purpose specified.

3. The tubular springs, in combination with the helve A, also made tubular for the introduction of a cold air blast, which passes by lateral ports through the springs, substantially as and for the purpose specified.

144,059.—Power-Hammer.—John C. Butterfield, Chicago, Ill. Application filed September 22, 1873.

The cross-head bearing the helve carries two tapering centers, into which bear pointed centers H H′, which pass through slides that are adjustable horizontally. Motion is communicated to the hammer-helve through a yoke passing over the journals of the cross-head and curving down under the helve, against which springs on the yoke press. The front or upper part of the standard is arched, and to it is adjustably secured a spring-buffer that gives force to the blow of the hammer. The front end of the yoke is attached, by means of a universal joint, to a connecting-rod driven by an adjustable eccentric.

Claim.—1. The combination of the yoke K, springs L and L′, helve F, and buffer M, substantially as and for the purpose specified.

2. The combination of the slides I and I′, horizontally adjustable on the standards B, and steel centers H and H′, passed through the slides and applied to the cross-head of a power-hammer, substantially as specified.

3. The cross-head composed of two parts, G and G′, and applied laterally to clasp the helve, when made in the form and working upon centers, substantially as and for the purpose specified.

4. The eccentric and its rod, and the yoke K, in combination with the connecting universal joint, composed of the coupling S and pins *s* and *s′*, whether said pins be tapering or not, substantially as and for the purpose specified.

5. The compound eccentric composed of the fixed eccentric O, having a concentric head, O′, with an annular T-shaped groove, o^1, and eccentric P, adjustable on the fixed one, and held in position by bolts *o*, substantially as specified.

144,060.—Water-Heating Apparatus.—Thomas M. Carroll, Independence, Iowa. Application filed July 10, 1873.

A heater adapted to be placed in a water or other tank. The draft, smoke, and feed pipes are located upon the top of the fire-box to avoid joints below the water-line. The draft-regulator may consist of a perforated tube guided upon the draft-pipe by a bent spring.

Claim.—The fire-box A, smoke-pipe D, fuel-pipe C, and draft-pipe B provided with a regulator, the said pipes being connected directly to the top of the fire-box, all constructed and arranged as and for the purpose specified.

144,061.—Method of Making Footed Glass Bowls.—Elijah G. Cate, Wheeling, W. Va. Application filed May 17, 1873.

The entire article is made at one stroke of plunger in a suitably-shaped mold.

Claim.—The hereinbefore-described method of forming footed glass bowls entire, in a suitable mold, by one stroke of the plunger.

144,062.—Blind-Slat Fastener.—Amos F. Champlin, Westerly, R. I. Application filed April 26, 1873.

Claim.—In connection with a blind, the spring *c*, having the fastening-center *d* and the ends *e*, curved flatwise toward the blind-slats, and provided with the ratchets *z* on their under or concave faces, to engage with the armed edges *p* of the said blind-slats, as specified.

144,063.—Device for Opening Oysters.—Douglas M. Cleary, Baltimore, Md., assignor of one-half his right to Joseph F. Broadbent, same place. Application filed September 2, 1873.

A knife with a weighted head is provided with a stem above it and a spring arranged in a guide-box, and operated by a treadle and connecting-rod.

Claim.—1. The weighted knife-head *c*, provided with the upward-projecting stem *d* and spring *e*, arranged between the top of the box *x* and the shoulder *m*, as described and shown.

2. The treadle connecting-wire *p*, arranged as described, in combination with the weighted knife-head *c*, as described, and for the purpose set forth and shown.

144,064.—Paper-Ruling Machine.—Horatio T. Cliff and John E. Martin, Detroit, Mich., assignors to George H. Smith, Thorndike Nourse, and Noah D. Lapham, same place. Application filed July 31, 1873.

A bracket, provided with a stud projecting at right angles therefrom, is attached to the under side of the frame to support a disk which rotates upon said stud and carries upon its face adjustable cams and a segment, the former of which, through a rod and spring-pawl, operates the pen-beam, while the latter, through similar devices, operates a crank-shaft, to which the striker or stops and a sheet-presser roll are attached.

Claim.—1. The bracket G, stud *c*, pinion H, ring *d*, adjustable cams J, lever K, rod L, and lever M, constructed and arranged with relation to the frame A and spur-wheel B′ to operate the pen-beam F, substantially as described and shown.

2. The rock-shaft N, frame S, roller T, arm O, rod P, and lever Q, operated by the segment I on the pinion H, substantially as and for the purpose set forth.

144,065.—Potato-Bug Exterminator.—Charles Cole, Chatfield, Minn. Application filed March 22, 1873.

Claim.—The narrow constricted cloth pocket *n*, expanding at its throat into two flaring wings, *m*, distended on a hoop, *b*, attached to a handle, *a*, extended across over the throat of the pocket, and holding in the hoop at its end to give a forked shape to the wings, substantially as specified.

144,066.—Type-Casting Machine.—James M. Conner, Greenville, N. J. Application filed September 20, 1873.

The pulley F has a uniform rotary motion, and is connected to the cam-shaft which carries the mold, by means of a slotted lever and crank, in such a manner that the shaft remains stationary for a certain period, giving a "dwell" to the mold.

Claim.—1. The pulley F, having an independent motion from the cam-shaft *g*, in combination with crank *q*, lever *k*, and the mold-carrying lever E of a type-casting machine, substantially as set forth.

2. The screw *o*, slotted lever *k*, pulley F, and crank *q*, in combination with the cam-shaft *g* and mold-carrying lever E of a type-casting machine, substantially as and for the purpose set forth.

144,067.—Spindle.—Lewis C. Crocker, Hopedale, Mass. Application filed September 26, 1873.

A sleeve or tube is encircled by a band or ring of felt, and is fitted within the step, the felt serving as a strainer to exclude dirt or dust from the bearing, while the cap fitting over the tube prevents dust or dirt from entering between the spindle and the tube.

Claim.—The tube d with its band or ring *e* of felt, in combination with the step A, and spindle b with its cap *f*, constructed to operate substantially as and for the purpose set forth.

144,068.—Horse-Stall for Steam Fire-Engine Houses.—William C. Davol, Jr., Fall River, Mass. Application filed July 19, 1873.

Within a rectangular room stalls are arranged with their backs toward the rear wall, sufficient being left next the wall for the horses to pass around and enter their respective stalls. The mangers are fixed in the stall-corners adjoining. The stall exit-doors are to the right and left of these, opening outwardly.

Claim.—In the improved steam fire-engine stable, the stall induction-passage B, each stall A, the manger M, the door D, doorway *d*, and the engine-room or space E, combined, constructed, and arranged substantially as described and represented, each stall at its rear and opening into the induction-passage B, as explained.

144,069.—Carriage-Top.—Charles A. Dearborn, New Bedford, Mass. Application filed July 19, 1873.

Claim.—The sheet-metal corner-plates B, for buggy-tops, having a longitudinal curvature corresponding with the radius of the top and a transverse curvature fitting the rounded corners of the bows, substantially as specified.

144,070.—Lamp.—Robert E. Dietz, New York, N. Y. Application filed March 21, 1873.

The lamp-font, inkstand, or other vessel has grooves in its lower end adapted to receive pins which project from the detachable base. The base is provided with a spring-bottom, which tends to hold the parts in position.

Claim.—The grooved projection *a* of the vessel, in combination with the recess *d* of the base, the pins *c c*, and the elastic bottom of the said vessel.

144,071.—Starching-Machine.—Alexander M. Dolph, Cincinnati, Ohio. Application filed October 6, 1873.

Two elastic rollers are secured on shafts that extend beyond the frame of the machine, and are driven by gearing and drawn together by levers, operated by a rod and treadle, and released by springs.

Claim.—1. The shafts A, A′, E, and K, gear-wheels C and C, pinions G and G, pivoted frame-bars D and D, and compression-rollers F and F, when constructed and combined to operate in the manner and for the purpose substantially as specified.

2. In combination with the pivoted frame-bars D and D, and the shafts and rollers E and F, respectively, the bars H and H, rod I, treadle K, and springs L, substantially as and for the purpose shown.

144,072.—Whip-Socket.—John W. H. Doubler, Alden, N. Y. Application filed August 28, 1873.

Claim.—1. The arm A, provided with clamps at its upper and lower ends, as set forth, in combination with the short arm, having clamps at its upper and lower ends and hinged to the arm A, substantially as described.

2. The arm A, provided with the curved projections C C, embracing the standard of the dash-board, in combination with the projecting piece O, curved at its outer end and attached to the arm A, as and for the purpose set forth.

144,073.—Whip-Socket.—John W. H. Doubler, Alden, N. Y. Application filed August 28, 1873.

A vertical bar is provided with left-and-right-hand clamps at the top and about the center, respectively, and with a half-socket or seat for the butt of the whip to rest in.

Claim.—The whip-socket, composed of the bar A, having the inclined half-socket or seat B and the right-and-left-hand clamps or curved arms C and D, substantially as shown and described.

144,074.—Spike-Bar.—George Douglass, Bridgeport, Conn. Application filed August 16, 1873.

The jaws of the bar are made double and removably attached to the lever.

Claim.—A spike-bar having its jaws made separate, and removably attached to the lever, substantially as shown and described, and for the purposes set forth.

144,075.—Process for Destroying Ants.—John J. Dulany and Henry Dreyer, Oakland, Tex. Application filed August 30, 1873.

A deep hole is bored with an earth-auger into the center of the main ant-hill, and a diagonal tube inserted reaching the main hole near the bottom. The main hole is partially filled with dry wood or other combustible matter and ignited, air being supplied by means of a large bellows through the diagonal pipe. When the combustion is complete poisonous gas producing chemicals are introduced and the orifice of the main hole closed, and the blast continued till the gas penetrates the entire interior of the burrow.

Claim.—The process of destroying ants by blowing poisonous vapors into their cells, in the manner described.

144,076.—Propeller for Cars.—George W. Earl, New York, N. Y. Application filed September 1, 1873.

Spur-wheel on car engages with the coils of a spiral wire between the tracks and propels the car when it revolves.

Claim.—1. The combination of a spiral spring, located between the rails of a track, with a rotary spur or toothed wheel on a car or other vehicle, substantially as described.

2. The spur-wheel G, having the cranks I I′, in combination with levers K K′, cords or chains J, pulleys M, in connection, and a spiral spring between the rails of a railroad-track, substantially as and for the purpose set forth.

144,077.—Loom for Weaving Pile Fabrics.—James C. Ellison, Philadelphia, Pa., assignor to himself and David N. Rothermel, same place. Application filed September 22, 1873.

The warp-threads are formed into pile-loops by means of hooks arranged upon a horizontal bar having a compound reciprocating movement, by which the hooks seize, raise, retain, and release the warp-threads placed within the range of their action. A positive let-off mechanism is combined with the hook-bar.

Claim.—1. The combination, in a loom carrying a special set of warp-threads controlled by special heddles, of a system of hooks and mechanism, substantially as specified, for imparting to the said hooks the within-described movement, for the purpose of seizing the said warp-threads, forming them into loops, and retaining and releasing the same, all as set forth.

2. The bar B and its hooks, and the rods B^1, adapted to blocks B^2, which are arranged to slide on guides *d d*, in combination with cranks D D, the pins of which enter quadrangular openings in the said rods B^1, all substantially as set forth.

3. The combination of the rods B^1, carrying the bar B with its hooks, and the cranks D on the shafts H, to which an intermittent reciprocating movement is imparted, all as and for the purpose set forth.

4. The bar B and its hooks, having the within-described movements, in combination with the positive let-off motion by which the special warp-threads are controlled to accord with the requirements of the hooks.

144,078.—Suspension-Pulley.—John A. Evarts, West Meriden, Conn., assignor to Bradley & Hubbard, same place. Application filed September 24, 1873.

Flat metallic springs are secured between the yoke and the sides of the pulleys. An adjusting-screw is attached to the yoke, by means of which the tension of the springs is regulated.

Claim.—The combination of the springs C with the pulleys B, substantially as and for the purpose specified.

144,079.—Lock for Fire-Alarm Boxes, &c.—J. Murray Fairchild, New Haven, Conn. Application filed July 9, 1873.

A tumbler or dog is arranged so as to engage and hold the principal key after the bolt has been withdrawn. To release said

key an auxiliary key is inserted in another key-hole and the tumbler or dog raised, when the principal key may be removed.

Claim.—1. The auxiliary tumbler F arranged to be operated by the principal key, and to engage the bit of the said key after the bolt is withdrawn, and prevent its removal from the lock, substantially as described.

2. In combination with the auxiliary tumbler F, constructed to engage the principal key after the bolt is withdrawn, the auxiliary key G, for operating the said tumbler to free the principal key, substantially as described.

144,080.—Chair.—GEORGE FELDKAMP, Cincinnati, Ohio. Application filed August 13, 1873.

At the joints on the under side of the seat-frame a brace or cleat is secured, having a socket passing through it and into the seat-frame to receive the tenon of the chair-leg. The brace or cleat is also provided with a dovetailed tongue that engages with a corresponding mortise in the seat frame.

Claim.—1. The combination of the socket-cleat D, secured to the frame A B and crossing the joint C, and leg L passing through the socket-piece and into the frame at a point removed from the joint C, all as specified.

2. The combination of the cleat D with tongue or tenon *a*, and the seat-frame A B with corresponding mortise *b*, as and for the purposes set forth.

144,081.—Spark-Arrester.—JAMES L. FERRY, South Brunswick, assignor to himself and ISAAC S. BUCKALEW, Jamesburg, N. J. Application filed February 21, 1873.

The perforated plate, formed into a series of parallel corrugations, is fitted and united to the shell of the boiler between the tube-plate and chimney for the purpose of arresting the sparks.

Claim.—The perforated plate E, formed into a series of parallel corrugations fitted and united to the shell of the boiler between the tube-plate B and chimney C, all as set forth, for the purpose specified.

144,082.—Bottle-Protector.—ORRIN FITZGERALD, Dexter, Me. Application filed May 13, 1873.

A block of wood of proper length and shape has a hole extending longitudinally through it for the reception of the neck of the bottle.

Claim.—A bottle-protector bored out for the reception of the neck of the bottle, and corresponding in length with the neck and in exterior form with the body of the bottle, substantially as set forth.

144,083.—Potato-Digger.—ELIAS T. FORD, Stillwater, N. Y. Application filed November 27, 1872.

The machine is mounted upon two wheels. A pair of vine-straighteners are attached to the forward end of the frame, and just beneath and a little in rear of the axle-tree are a pair of plows or cutters, which face inward. Immediately in rear of these is a revolving digger having a series of fingers set obliquely to the line of draft, and upon the side toward which the potatoes are thrown is placed a reciprocating screen, which separates the soil from the potatoes.

Claim.—1. The vine-straightener, consisting of the combined diverging beams I', pivoted to or upon the pole A', and provided upon their rear lower ends with the shovels K' and guide-bars *k*, all combined and arranged substantially as and for the purpose specified.

2 The slatted or barred receiver O and *o*, constructed as shown, and combined with the tined separator U and *u*, which has a reciprocating motion in a line with the draft, substantially as and for the purpose specified

3 In combination with the rotary digger, the loosening-plow F, provided with the guide bars or rods *f*, which are secured to and extend rearward, upward, and inward from the same, substantially as and for the purpose shown.

4. A rotary digger, revolving in a vertical plane, having an oblique angle to the line of draft, and provided with radial arms, the tines of which from front to rear are arranged upon a plane having an angle of about forty-five degrees with relation to said plane of motion, and which radially extend outward and slightly rearward in a forward curve, substantially as and for the purpose set forth.

5. The construction, combination, and relative arrangement of the loosening-plows, rotary digger, and reciprocating separator, substantially as and for the purpose shown and described.

6. The means employed for suspending the separator U and *u*, and imparting thereto a horizontally-reciprocating motion, consisting of the pivoted bars V and W, the rod X, the pivoted lever Y, and the cam-grooved disk Z and *z*, all constructed and combined to operate substantially as and for the purpose specified.

7. In combination with the main frame and pole section, the levers B' and C', pivoted together, and connected with said parts, in the manner and for the purpose substantially as shown.

144,084.—Manufacture of Music-Box Cylinders.—ARNOLD FRANKFELD, New York, N. Y. Application filed October 11, 1873.

To make the duplication of music-box cylinders, of a particular toothing, easy and accurate.

Claim.—A pattern-cylinder receiving within it the music-cylinder, and provided with holes at places corresponding to the position where the pins are to be placed in the music cylinder, and through which holes the music-cylinder is bored or marked, as specified.

144,085.—Composition for Preserving Dead Bodies.—JOHN M. GALLAGHER, Carthage, N. Y. Application filed September 13, 1873.

Claim.—A disinfectant compound formed of alum, chlorate of potash, corrosive sublimate, and alcohol, in the proportions set forth.

144,086.—Apparatus for Dispensing Soda and Mineral Waters.—WILLIAM GEE, New York, N. Y. Application filed September 12, 1873.

A stand-pipe divided into two compartments receives all the supply and draft pipes into one of them and the waste-pipe in the other. The waste-pipe and the wall of the compartment inclosing it are perforated at such points that water may be drawn off free from scum or sediment.

Claim.—1. The combination, with a cooler or draft-stand for soda and mineral waters, of the stand-pipe having two compartments, one for the waste-pipe and the other for the delivery-pipes of the soda and mineral waters, substantially as and for the purpose herein set forth.

2. The combination of the waste-pipe D, perforated with holes *e e*, as described, and its compartment *a* of the stand-pipe, perforated some distance below the waste-pipe holes with holes *f f*, essentially as and for the purposes specified.

144,087.—Method of Laying off Shoe-Uppers.—CONRAD GLANVILLE, San Francisco, Cal. Application filed August 13, 1873.

Claim.—The within-described pattern or method of cutting uppers for shoes, in which the rear edges of one piece are laid off against the front edge of the next, and the tops all laid in the same line, as set forth.

144,088.—Steam-Generator.—WILLIAM GOLDING, New Orleans, La. Application filed May 13, 1873.

Steam is generated by means of heated masses of metal placed in the closed chamber. Intended for street-cars.

Claim.—A steam-generator having within its water-space a closed chamber, A, for the reception of heated masses of metal, substantially as and for the purpose specified.

144,089.—Shuttle-Box-Operating Mechanism.—ROBERT B. GOODYEAR, Wilmington, Del., assignor to himself and JOHN GREENHALGH, Philadelphia, Pa. Application filed August 29, 1873.

The shuttle-box supporting-rod is pivoted to the vibrating stepped lever, moved by the vibrating pawl on the reciprocating slide-rod. A projection from the box-rod rests on the edge of the cam-lever, and these parts are always in contact when the boxes descend or are at rest. The pawl is moved from the pattern-cylinder.

Claim.—1. In a drop-box loom, the combination, substantially as described, of a pawl, A, controlled by a pattern wheel or chain, the stepped lever B, and the rod D, supporting the drop-boxes, and hung to and deriving its upward movement from the said lever B.

2. The combination, substantially as described, with the drop-box rod D, of the lever F, acted on by a spring or weight, and formed with a series of cam-like inclines and shoulders for facilitating the proper adjustment of the said rod, and for sustaining the same after adjustment.

3. In a drop-box loom, the combination, substantially as described, of the stepped lever B, the stepped cam-lever F, the pawl A, controlled by a pattern wheel or chain, and the drop-box rod D, hung to said lever B.

144,090.—Balanced Slide-Valve.—OTTO H. GROSSBERG, Ferrysburg, Mich. Application filed July 15, 1873.

The openings in the valve, in connection with the opening in the fixed plate, are to allow the exhaust steam to form a cushion in the opposite end to that in which live steam is admitted to the cylinder. The live steam enters the port that is usually used for the exhaust.

Claim.—1. The valve B provided with the openings F *i i*, and the plate C provided with the channel *j* and ports H H, constructed and arranged in the steam-chest D with relation to the induction E, side pipes G G, and eduction K, substantially as and for the purpose set forth.

2. The valve B, working under the plate C, and provided with the cavity or opening F for conveying steam from the induction E to the ports G G alternately, substantially in the manner described.

3. The arrangement of the openings *i i* in the valve B with relation to the channel *j* in the plate C for cushioning the exhaust side of the piston with steam from the other side thereof as it approaches the end of each stroke, substantially as described.

144,091.—Suspenders.—SAMUEL HAMM, Philadelphia, Pa. Application filed September 13, 1873.

A pair of suspender button-straps are cut from a single piece in such a manner that the tongue-piece, which is cut out from between the two straps, is doubled up and folded over to secure the ends of the shoulder-straps.

Claim.—1. The piece B, constructed of a single piece, as shown and described, to form the straps *b b* and tongue C.

2. In combination with the piece B, having the straps *b b* and tongue C formed of a single piece, the bands A A, substantially as shown and described.

144,092.—Saw-Set.—HUBERT C. HART, Unionville, Conn. Application filed August 22, 1873.

The oscillating lever-guard *d* is elevated and depressed by means of the set-screw *e*, and clamps the saw firmly while the tooth is being set by the jaw *b'*.

Claim.—The combination of the handle *a* having the jaw *a'* and finger a^2, the handle *b*, lever b^1, and the oscillating lever-guard *d* d^2 d^3, with its screw *e*, the whole constructed, arranged, and designed for operation and use substantially as described.

144,093.—Whip-Socket.—JOHN HERBERLING, Mount Pleasant, Ohio, assignor of one-half his right to CHARLES L. MCCOY, Wheeling, W. Va. Application filed July 29, 1873.

Claim.—The combination of the short socket C, with a recess in its back, and the extended curved plate A, with its lower curved end extending into the recess in the socket C, the plate A being secured to the dash-board, and the socket C pivoted to said plate, all substantially as set forth.

144,094.—Fastening for Pocket-Books.—FREDRICK HEILES, New York, N. Y. Application filed August 20, 1873.

The face-plate is made in two conforming sections, the upper one being rigidly attached to a base-plate, while the lower one is pivoted to the same base, and acts as a spring-catch, having a projecting perforated tongue, which is concealed by the upper section. When the spring-catch is drawn back, its perforations come opposite to those of the upper section to admit the barb attached to the closing flap.

Claim.—In a fastening for pocket-books, the jaw *c*, pivoted at one end upon the case A, forming a continuation of its face-plate *d* when closed, in combination with the spring *d'*, locking-arm *f*, and barb *h*, all constructed as herein shown, for the purpose specified.

144,095.—Foot-Warmer.—WILLIAM HEIKENBUTTEL, Brooklyn, N. Y. Application filed September 27, 1873.

Two orifices are provided, so that when hot water or hot sand is poured in at one air may pass out at the other.

Claim.—The foot-warmer herein described, consisting of the earthenware vessel A provided with depressions *a a*, passages *b c*, and a transporting-handle, substantially as and for the purpose specified.

144,096.—Eyelet for Harness-Traces.—NICHOLAS HIATT, Plum Hollow, Iowa. Application filed September 15, 1873.

Claim.—The bar B, provided with the eye C and head or clip D, and secured within the end of a tug or trace, A, substantially as and for the purposes herein set forth.

144,097.—Faucet.—PAUL HILLE, Union, N. J.—CASE B. Application filed June 27, 1873.

A plate provided with converging perforations is adjusted at the exit of a faucet, in order to cause an even flow of fluid therefrom, and concentrate the steam.

Claim.—The combination, with a faucet, of the convex plate arranged in its mouth, and perforated with converging holes, substantially as and for the purpose specified.

144,098.—Governor for Steam-Engines.—JOHN C. HOADLEY, Lawrence, Mass. Application filed August 1, 1873.

Slotted arms, connected and working together on a pin, are attached to a slide and sleeve working up and down on two additional arms in the pulley or fly-wheel. The sleeves have on them adjustable weights at right angles, which, by the centrifugal force, cause the sleeves to move away from each other, while two bow-springs, when the speed slackens, produce counter movements of the sleeves.

Claim.—1. The slotted arms *g g*, the stud *i*, and slide *k*, arranged and combined together and applied to the eccentric F, the fly-wheel or pulley B, and the sleeves *c c*, provided with the connected springs *d d* and the weights C, all essentially as specified.

2. In the governor, the two series C C of weights, and supporting-arms d' d' d' d', constructed and arranged with the two sleeves, as explained.

3. In combination with the slotted arms *g g*, applied to the sleeves *c c* and slide-stud *i*, as set forth, the counterbalance weights or projections *r r*, such being for the purpose specified.

144,099.—Sower, Planter, and Cultivator.—SQUIRE D. HOPKINS, Milford, Kan. Application filed February 27, 1873.

This is a convertible machine that may be used simply as a cultivator, or seeder, or corn-planter. There are three shares in each gang. The middle one is provided with a seed-tube, and this can be set forward, so as to become an opener, while the other two act as coverers.

Claim.—1. The combination of plow-yoke H, frame G, plow-beams N N, and lever I, when arranged and operating as shown and described.

2. The combination, with each other, of the three plows u' u^2 u^3 in one group, when the middle plow, u^2, is made movable lengthwise between the others, as set forth.

144,100.—Screw-Threading Machine.—ELI HORTON, Windsor Locks, Conn. Application filed January 21, 1873.

The bed *b*, supporting the head and tail stocks, is reciprocated by a screw beneath. A revolving shaft *d*, obliqued to the bar to be cut, which is hung between the centers, carries a milling cutter, that forms the thread as the bar is moved with the bed. The bar is revolved in the same direction as the cutter by gear connections. The lower edge of the cutter revolves in a pan of oil.

Claim.—The combination of the tail-stock, the cutter-shaft *d*, running underneath the tail-spindle b^4, the cutter *c*, and the oil-box *g* underneath the cutter, all constructed, arranged, and designed to operate substantially as described.

144,101.—Cuff-Holder.—GEORGE W. JAMES, Jersey City, N. J. Application filed October 6, 1873.

The bent spring-plate is hooked into a loop upon the coat-sleeve, and the edge of the cuff is clamped between its ends.

Claim.—The cuff-holder consisting of the spring-plate C and loop *c*, constructed substantially as described and shown.

144,102.—Railway-Switch.—SAMUEL H. JENKINS, Nashville, Tenn. Application filed May 3, 1873.

The switch is of that class in which double switch-rails are simultaneously shifted in opposite directions by a long shaft with cranks and pitmen, thus dispensing with the use of frogs. In this case the shifting-lever which operates the shaft is heavily weighted, the weight falling against inclined pillow-blocks in the two positions which it assumes, where it is retained by spring-catches and a spear-shaped latch. This arrangement, while retaining the switch sufficiently under ordinary circumstances, allows the same to yield under an emergency, when wrongly placed, the train pressing the rails into parallelism, and throwing the weighted lever over to the opposite pillow-block, thus setting and holding the switch automatically.

Claim.—1. The combination and arrangement of the pivoted rail E, shifting-bar H, and crank-rod F, having one of its cranks, *b*, and its weighted lever K in the same plane with each other, and the latter resting upon an inclined pillow-block, L, substantially as and for the purpose set forth.

2. The pillow-blocks L L, weighted lever G, spear-headed catch *d d*, clamp-springs *e e*, or their equivalents, in combination with rod F, cranks *b c*, bars H I, and switch-rails C C and E, all arranged as and for the purposes set forth and described.

144,103.—Cask for Transporting Oils, &c.—WILLIAM JENKINS, The Willows, Abergavenny, England. Application filed October 11, 1873.

The cask is covered with felt, which is coated with lime or chalk wash to prevent leakage and render the felt less absorbent of heat.

Claim.—A wooden cask, covered either wholly or partially with felt, or other equivalent material of a compressed fibrous character, for the purpose specified.

144,104.—Slate-Frame.—ALBERT H. JOCELYN, New York, N. Y. Application filed June 25, 1873.

The artificial or other slate slides into grooves in the frame, which it supports, and is held therein by a peg or cord. Two or more slates can be used.

Claim.—1. The combination of the diaphragm D with the side and end pieces A A and B B of the frame, and the slot or slots *b* for the removable slate or slates, said diaphragm serving to brace the frame pieces together, and to form a back or support to the slate or slates, essentially as herein described.

2. The combination, with the slot or slots *b* in the frame, of the cross-hole *d* and the slate or slates C, substantially as and for the purpose herein set forth.

144,105.—Heating-Stove.—JOSEPH JOHNSON, Harrisburg, Pa. Application filed October 26, 1871.

The sliding plate H', with its flange A, regulates the quantity of heat to be radiated into the room in which the stove is placed, as well as the quantity to be discharged into an apartment above.

Claim.—1. The combination, with the casing of the stove and with the space G, of the heating-chamber E, arranged as set forth.

2. The combination of the casing D, the permanent heating-chamber E, the slides H and H', and the annular space G communicating with the upper rooms.

3. The combination, with the casing of the stove, of slides H H', having inner flanges A, and adjustable to form chambers of varying extent, as set forth.

144,106.—Toy Money-Box.—CHARLES C. JOHNSON, Somerville, Mass. Application filed July 10, 1873.

When open to its fullest extent the door remains open and the figure holds a plate to receive any coin that may be offered. Upon moving the door slightly, to pass the point at which the spring holds it open, the door is automatically closed by the same, the figure depositing the money in the vault to the rear.

Claim.—1. The toy bank having the partition *f*, with its money-slot *v*, and the image *o* and its plate *p*, operated by the spring *r*, to carry the money through the slot *v*, and to close the door, when the said parts are combined and arranged substantially as shown and described.

2. In combination with the door and image *o*, the wire link *w*, arranged to move the image as the door is opened and closed, and to hold the door in open position, all substantially as shown and described.

3. In combination with the rods *g*, the inclines *k* for securing the rods, substantially as shown and described.

4. The spring *r*, in combination with image, for throwing it inward and shutting the door, and with the spring-link to hold the door open, all substantially as shown and described.

144,107.—Shifting Top for Vehicles.—MARTIN B. KELLER, Penn township, (near Litiz,) Lancaster county, Pa. Application filed July 5, 1873.

A seat so constructed that either the back or sides can be

combined with the seat, whether or not a top is permanently attached to the sides.

Claim.—The seat A, with its shouldered offset a extending around three sides, and provided with catch-plates B B B' B' and latches C, in combination with the detachable back and sides E and braces D D D' D', arranged substantially in the manner and for the purpose set forth.

144,108.—Peanut-Roaster.—DANIEL KELLOGG, Ypsilanti, Mich. Application filed August 22, 1873.

The basket has a metallic bottom surrounded by a downwardly-projecting flange, to which is secured a chamber in which is hung upon gimbals a lamp for heating the bottom of the basket. A damper or valve may be interposed between the lamp and this metal bottom to regulate the heat. A revolving stirrer is provided above the bottom plate. The whole apparatus is furnished with a knapsack-sling for convenience in carrying.

Claim.—A peanut-roaster consisting of the body A, bottom B, cover C, flanged stirring-ring D D', crank b, flange E, diaphragm H provided with the slats I, base-chamber F, lamp G, and sling J, substantially as and for the purpose set forth.

144,109.—Bonding-Machine.—SMITH W. KIMBLE, Springfield, Ill. Application filed September 13, 1873.

The arm g^3 of the segment G carries friction-rollers E (bearing on the material) and e bearing under the arm D of the frame B.

Claim.—A vibratory segment provided with slotted arms, between which are placed the side rolls F and reciprocating top roll E, combined, as described, with a curved convex former, C, and a superposed bar, D, the subjacent surface of the latter gradually approaching the top of the former from front to rear, as set forth.

144,110.—Fish-Grappling Spear.—JONAH W. KNAPP, Cross River, N. Y. Application filed July 12, 1873.

Striking the fish near the joint of the jaws instantly springs them to seize the prey; the jaws may also be sprung at the will of the fisherman by an S-lever operated by cords attached to a sliding sleeve upon the handle.

Claim.—1. The combination of a cam, N, with jointed springs C, grappling-hooks A, and the devices for opening and setting said hooks, the cam being so arranged that it relaxes the tension of the springs preparatory to the opening of the hooks, substantially as specified.

2. The arrangement of the rock-lever cam N, rod G, the rods and chain or cord I, and the sleeves E F, for restoring the tension of the springs after setting the hooks, substantially as specified.

3. The combination of the tripping-rod T with the jointed spring-actuated grappling-hooks A and stock, substantially as specified.

4. The combination of the adjustable clip O, springs C, cam N, rock-lever H, and the spear-stock, substantially as specified.

144,111.—Saw-Jointer.—SAMUEL D. KNIGHT, Bryan, Ohio. Application filed August 13, 1873.

Claim.—A device for jointing long saws, consisting of the slotted file-holder a, having legs to form an extended bearing on both sides of the saw-blade, and provided with set-screws f g, as shown and described.

144,112.—Construction of Tunnels and Sewers.—GEORGE KNOLL, San Francisco, Cal. Application filed January 17, 1873.

The tunnel is made of bricks, numbered for curvature, formed with tongues for matching, and pierced with holes for the reception of the longitudinal supporting-rods upon which they are strung. The structure is thus bonded together without mortar. An extensible brace, C, is placed transversely in the structure for sustaining gas and water pipes laid therein.

Claim.—1. The structure S, built with numbered bricks B B', through the bodies of which rods or tubes r r are run longitudinally so as to string several together for preserving the shape of the structure, substantially as and for the purpose herein set forth.

2. The compound adjustable braces C, provided with necks n n', flanges b b', and curvatures z z', in combination with the tongued and grooved bricks B B' and longitudinal rods r r, substantially as and for the purpose hereinbefore set forth.

144,113.—Splicing Fence-Rails.—DANIEL W. KNOWLES, Hotchkissville, Conn. Application filed August 27, 1873.

The joints are covered on top and bottom by flanged metal plates, connected together by bolts and nuts. The upper plate of the top rail is extended laterally, and provided with a socket for top of post. The upper plate of the lower rail is also extended laterally, and provided with an elongated perforation for reception of lower end of post.

Claim.—The herein-described fence-rail coupling, consisting of the plates C D with their flange e, and formed with a socket or perforation to receive the post, substantially as described.

144,114.—Combination-Padlock.—WILLIAM C. LANGENAU, Cleveland, Ohio, assignor of one-half his right to JOHN ADAM LANGERT, same place. Application filed September 22, 1873.

The notched disks are held in contact with the stud or driving wheels by means of an oscillating plate having curved projections that bear against the supporting-plate of the said disks. By turning the oscillating plate in one direction its curved projections will enter notches in the supporting-plate, and allow a spring to throw the notched disks out of contact with the stud-wheels when the combination can be changed as desired.

Claim.—The plate K, fitted to move on stud L, having the curved projections k k, combined with subjacent plate H having notches A A A, as and for the purpose described.

144,115.—Tassel-Top.—HENRY C. LEES, Camden, N. J., assignor to ELIZABETH F. LEES, same place. Application filed April 19, 1873.

Claim.—A tassel-top composed of a number of separate blocks, A B C, &c., inclosed in a continuous braided cover, F, substantially as herein described.

144,116.—Reciprocating Winnower.—ERASMUS LOMBARD, Plymouth, Mich., assignor to himself and AUGUSTUS H. COLBY, same place. Application filed April 8, 1873.

Claim.—1. In a grain-separator, the arrangement of the shoe to vibrate on a central axis, substantially as shown and set forth.

2. The combination of the centrally-pivoted shoe D with the friction-roller e, arranged to roll in recess e', and link H, lever G, and cam-grooved fan-shaft F, as described.

144,117.—Hoop-Lock.—THOMAS E. LUCAS, Chesterfield, N. C. Application filed July 19, 1873.

The ends of the hoop are split and secured in conical receptacles by wedges.

Claim.—1. The wedge-shaped sockets C, connected by the plate D, and arranged opposite with a space, E, between them to admit of the insertion and removal of the wedges D, as shown and described.

2. The combination of the block I and screw J with the sockets C C, as and for the purposes described.

144,118.—Hand Washing-Rubber.—AUSTIN S. MANN, Pittsburg, Pa. Application filed October 13, 1873.

Two rollers are pivoted in a suitable frame, to which is attached a hollow handle for containing water that may pass through openings onto the clothes to be washed.

Claim.—1. A hand washing-rubber composed of one or more rubbing-rollers and a hollow hand-piece, forming a reservoir, F, substantially as and for the purpose specified.

2. A hand washing-rubber composed of one or more rubbing-rollers and a hollow hand-piece, having covered passages f f, central port f^1, and small discharge-holes f^2, substantially as and for the purpose specified.

144,119.—Beer-Drawing Attachment for Casks, &c.—SAMUEL MARKS, San Francisco, Cal. Application filed June 28, 1873.

Consists of a receptacle, having a controllable valve and a porous plug in it, arranged between the key and the point of drawing the beer, whereby more or less of the gas is allowed to escape from a small quantity of the beer in the receptacle.

Claim.—The vessel B, having suitable connections for receiving and drawing off the beer, in combination with the porous plug D and controllable valve A, substantially as described, for the purpose set forth.

144,120.—Means for Operating Heavy Guns.—ALEXANDER MONCRIEFF, Culfargie, Scotland. Application filed June 29, 1870.

Claim.—1. The construction of the parts herein described, whereby the air is hermetically inclosed in a reservoir, and the action thereof controlled by a stop back-valve for retaining the air-pressure when the gun has descended after firing, and by a by-pass, provided with a valve for allowing the air-pressure to effect the raising of the gun-carriage.

2. The air-pump N, when constructed and combined as described, with the air-vessel I and cylinder E, for the purpose of furnishing air to the air-vessel and water to the cylinder, as may be required.

144,121.—Organ Reed-Board.—WILLIAM MUNROE, Worcester, Mass., assignor to THE MUNROE ORGAN-REED COMPANY, same place. Application filed August 26, 1873.

The roof of the reed-cells is a glass plate slid into grooves, holding it firmly in place.

Claim.—In combination with the openings d of the cells of a reed-organ, the glass plate e, substantially as and for the purpose described.

144,122.—Fire-Escape.—SAMUEL MUMBET and EMIL ZUBENBUHLER, Philadelphia, Pa. Application filed June 7, 1873.

The block around which the rope passes is readily detached from the box, so that the rope can be taken off or put on at pleasure and the block replaced in the box.

Claim.—The combination, substantially as described, of the detachable grooved block A' with the box D and its lid E.

144,123.—Bit-Stock.—D. APPLETON NEWTON, New York, N. Y. Application filed September 16, 1873.

The jaws for retaining the shank of the bit are made convex in outline between a and b, which, in connection with opening bevels at c, touch the shank at two points.

Claim.—A bit-stock having jaws with the faces of their grooves formed crowning between the points a and b, substantially as shown and described.

144,124.—Toy Building-Block.—ABRAHAM OSBORNE, Jr., Baltimore, Md. Application filed September 23, 1873.

Claim.—1. The toy building-blocks and pieces A B D, herein described, when constructed in the manner and for the purpose specified.

2. The jointing-block D, provided with holes d' d', in combination with end-tenoned connecting-pieces, as and for the purpose specified.

144,125.—Wrecking Apparatus.—MILO OSGOOD, Cleveland, Ohio. Application filed August 4, 1873.

A separate device, adapted to clamp and hold a cable under tension, formed a cable-clutch, is combined with ropes and buoys so as to be adjusted upon and hold the cable drawn around a sunken wreck. Also, in combination with the encircling cable, a dog or hook held in contact with the vessel by buoys until the hoisting apparatus is attached, when they serve as an additional or auxiliary hold upon the wreck.

Claim.—1. The cable-clutch consisting of the sheave I and pawls J, in combination with the sheaves b and side plates, substantially as and for the purpose set forth.

2. The pawls J and ropes K, in combination with the ropes M and sheaves b, substantially as and for the purpose set forth.

3. The cable-clutch connected with the buoys, in combination with the cable A, operating conjointly, substantially as and for the purpose set forth.

4. The dog D, hinged to the cable by the eyebolt a, in combination with the cable and chain C', substantially as and for the purpose set forth.

144,126.—Shutter-Fastening.—JULIUS PARKER, Meriden, Conn., assignor to CHARLES PARKER, same place—Case B.

Application filed September 24, 1873.

The cylindrical case of a shutter-fastening is cast with a flange upon one end and a series of teeth or serrations upon the other end.

Claim.—The barrel A, when cast with the flange C upon one end, and the teeth c upon the other end, and inclosing the lever B, in combination with the collar E, having a single screw-thread cast upon its inner edge, so as to engage the teeth c, substantially as described.

144,127.—Hoe.—HARRISON PARKMAN, Philadelphia, Pa. Application filed July 24, 1873.

The hoe-blade is grooved from the center to the point, the broad part being flat, the cap which secures the blade to the handle sinking into the depression or groove. The handle-socket and tenon are angular in form.

Claim.—1. The combination, with the hoe-blade A B, having a central groove and rib, of the cap-plate I and handle-socket G, provided with tenon F, as shown and described.

2. The improved hoe-blade, formed of the wide straight-edged part B, and the pointed end A, provided with a rib, e, ridge C, and inclined sides, as and for the purpose specified.

3. The handle-socket G, made of rhombic form in cross-section, and arranged with the angles coinciding with the sides or edges of the hoe-blade, as and for the purpose specified.

144,128.—Chuck.—LEANDER PARMELEE, New Haven, Conn., assignor to himself and MERRITT HINE, same place. Application filed October 1, 1873.

The jaws D are made capable of grasping tapering spindles by being pivoted to the levers C, and are held parallel to the axis of the chuck, to prevent displacement, by the disk F, said disk being pressed forward by the spring N.

Claim.—The head A, having two or more levers, C C, arranged therein, provided with a spindle, B, and conical sleeve E, and the jaws pivoted upon the forward end of the lever, combined with the disk F in the rear of the said jaws, and a spring-pressure thereon, substantially as herein set forth.

144,129.—Cigar-Box.—ELIAS C. PATTERSON, Rochester, N. Y. Application filed October 23, 1873.

The cover is in two pieces hinged at the outside, one being wider than the other and lapping upon each other flush by means of rabbets in each. One cover is free to open to show the cigars, while the other holds them in the box, and is secured by means of metallic fastenings at the ends thereof. The revenue-stamp is applied to the wide part of the cover in the rabbet, and extends downward over the metal fastenings, and thence under the box.

Claim.—The cigar-box A, having lids B and C, constructed as described, in combination with the bent metallic fastener e e, over which the revenue-stamp is applied, and button I, or its equivalent, as and for the purpose set forth.

144,130.—Lamp.—JULIUS A. PEASE, Boston, Mass. Application filed August 8, 1873.

Adapted to burn adamantine, &c. An auxiliary tray holds a supply of burning material to feed the wick until the main portion of the material becomes sufficiently melted.

Claim.—1. The cup or tray C, having a central sleeve terminating in a spreader, substantially as and for the purpose specified.

2. The cup or tray having a central sleeve, in combination with the outer reservoir, provided with a central cylinder, and the wick-tube and its reservoir, substantially as specified.

144,131.—Nut-Lock.—SANFORD PRATTFIELD, Ipswich, Mass. Application filed August 20, 1873.

The nut is beveled on its inner surface, and the fish-plate grooved. A metallic washer is interposed between the plate and nut, and rests against the edges of the groove in the plate.

Claim.—The nut provided with the opposite bevels b b, in combination with the connection-bars A A', grooved longitudinally, and washer E, all being constructed, arranged, and applied together substantially in manner as shown and described.

144,132.—Lamp.—ORSON M. PERKINS, Meriden, Conn., assignor to EDWARD MILLER & Co., same place. Application filed April 30, 1873.

The socket, by which the lamp-bowl is connected to the pillar, is provided with a screw-thread corresponding to the screw-thread of a gas-fixture, independent of the nut by which the bowl is secured to the pillar.

Claim.—In combination with the bowl A of a lamp, and the cup D carrying the nut s and stump E, a threaded socket formed in the bottom of the lamp or attached to the said cup, substantially as set forth.

144,133.—Ice-Elevating Track.—ANTHONY PFUND, New York, N. Y. Application filed October 10, 1873.

Claim.—A slide constructed of a series of arms, B, which radiate from a central column, A, and support spiral stripe a, and a spiral rail, c, substantially as shown and described.

144,134.—Wrench.—LYMAN B. PRINDLE, Bantam Falls, Conn., Application filed July 12, 1873.

The jaws are arranged in a slotted cross-piece, and clamped at the desired point by thumb-screws.

Claim.—In a brace-wrench, the laterally-slotted transverse bar B, in connection with the lateral clamp-screws and the jaw-blocks, having biting shoulders e and hook projections d, the latter entering the slots of the bar B, and performed to engage with said clamp-screws, substantially as specified.

144,135.—Protection for Underground Telegraph-Wires.—EDWARD D. PRITCHARD, New York, N. Y. Application filed September 4, 1873.

A trough or tube filled with layers of solid beds, having upon their upper surfaces continuous grooves for the reception of line-wires, is provided at proper points with lateral chambers into which the grooves and wires turn from, and return to, the main trough upon short beds, alternate ones only of which are used as line-beds, the others being removable, to afford access to the wires.

Claim.—1. The chambers E, arranged upon opposite sides of the case A, and forming a continuation of the case or beds B, substantially as described, for the object specified.

2. The combination, with the bed or beds B and chamber or chambers E, of a movable grooved slide, substantially as described.

3. The case A, having the grooved chambers E arranged upon its opposite sides, in combination with the grooved beds B B and doors F, substantially as and for the purpose described.

144,136.—Shearing-Machine.—JOSEPH K. PRIEST, Nashua, N. H., assignor to himself, R. T. SMITH, JOHN G. BLUNT, and WILLIAM EARL, Jr., same place. Application filed March 26, 1873.

An equalising-plate forms a free bearing for the rear ends of the cutter-carrying arms, and is adjustable by a flanged screw acted upon by a spring. The cutters are notched at their points, and afterward "struck up" to form a concave or hollow bearing upon the comb. The universal gear employed is a spur-wheel having teeth which project beyond the disk, and a pinion hung so as to gear into the outside ends and insides of the said teeth.

Claim.—1. Two or more cutter-carrying arms, l, pivoted to a laterally-vibrating bar, G, in combination with the rear-bearing adjustable equalising-plate J, substantially as described.

2. The plate J, substantially as described, applied upon the cutter-adjusting device s of a shearing or clipping machine, for the purpose set forth.

3. The combination of spring S with the flanged adjusting-screw s and a bearing-plate for the cutter-carrying arms l, substantially as described.

4. V-shaped cutters, notched at w, substantially as described.

5. The shearing or clipping cutter applied to its arm, as described, and finding a flat bearing upon the comb-plate B by rocking free of the arm which carries it, as and for the purpose set forth.

6. The spur-wheel g, with its projecting or offsetting teeth, in combination with the pinion h, arranged to gear with it and permit the universal movement, as herein set forth.

7. The combination of the gearing g h, constructed as described, with the shields D and E, forming the elbow-joint between the driving and the crank shafts of shearing and clipping machines, substantially as described.

144,137.—Windmill.—SAMUEL H. RADWAY, Berlin, Wis. Application filed August 22, 1873.

The driving-wheel is so placed that its pitch-line will be at the prolongation of the axis of the turn-table. To compensate for the inclination of the upper section of the vertical shaft it is loosely coupled to the lower section.

Claim.—1. The arrangement of the geared driving-wheel of a windmill upon its shaft so that its pitch-line will be at a prolongation of the axis of its turn-table, substantially as and for the purpose set forth.

2. The construction and arrangement of the driving-wheel F, pinion J, and shaft H, with relation to the driving-shaft E and vertical shaft G, substantially as and for the purpose set forth.

144,138.—Machine for Dressing Staves.—JOHN J. RALYA, Cleveland, Ohio. Application filed June 18, 1873.

Devices are employed independent in their operation, so that when a stave thicker on one edge than on the other is fed in the rolls D are forced apart to conform to the section of the stave, which is presented directly in line to the knives.

Claim.—The blocks *a* and racks *c* on each end of each roll, in combination with the pinions *d*, springs *g*, and rolls D, substantially as set forth.

144,139.—Boring-Machine.—Benjamin F. Rea, Moses Pyke, and David M. Rennor, South Bend, Ind.; said Pyke assignor to said Rea and Rennor. Application filed August 2, 1873.

For boring holes at any distance apart, and either in wood or metal, by a simple change of the boring-bit.

Claim.—The combination of the shafts J and O O, provided with the bit-holders, with their respective bevel-gears, the frames G and H, and the adjusting-screws P, the several parts constructed and arranged substantially as described, for the purpose set forth.

144,140.—Floor-Clamp.—Henry J. O. Reed, Salem, Mass. Application filed August 30, 1873.

The pin C being inserted in a hole in one of the joist-timbers the eccentric curved surface *b* will force the plank to its place, the point *f* of the dog D retaining it in position.

Claim.—The floor-board set, consisting of the clamping-head A, bars B B, strengthening-plates *c c* with pivot-pin C, and the pivoted reversible retainer D, substantially as shown and described.

144,141.—Hydraulic Cushion for Water-Pipes.—William Ricketts, Cincinnati, Ohio. Application filed July 3, 1873.

A rubber diaphragm rests upon a metal disk corrugated on its upper surface and supported in a chamber connected to the pipe by a suitable spring, thus acting as a gentle cushion to yieldingly resist the ramming effects of the water.

Claim.—1. In connection with the interior of water-pipes, the elastic disk F and corrugated or indented plate D *d* operating in conjunction, substantially in the manner as and for the purpose specified.

2. In connection with the interior of water-pipes, the elastic disk F, corrugated or indented plate D *d*, and rubber or metallic spring G, operating in conjunction, substantially in the manner and for the purpose specified.

144,142.—Box-Clamp for Tobacco-Presses.—Thomas L. Robertson, Madison, N. C. Application filed October 4, 1873.

Claim.—The clamp formed of two blocks, A B, made of hard wood, notched across the grain upon their inner sides, and held together by two or more bolts, C, substantially as herein shown and described.

144,143.—Horse Hay-Fork.—Byron B. Rockwell, Waterford Mills, Ind. Application filed September 15, 1873.

The hoisting-rope is attached directly to the locking-levers, so that, when unlocked, the upper ends of the tine-extensions are brought toward each other, and the tines thereby made to release the elevated load.

Claim.—The combination, with the arms A A and tines B B of a hay-fork, of the locking-bars C C′ and the latch G, the bar C′ being provided with the projection *f*, and the two bars pivoted together at *e*, and having the hoisting-rope connected to them at said pivot, all substantially as and for the purposes herein set forth.

144,144.—Belt-Hole Cover.—Toppan P. Rodgers, Taunton, Mass. Application filed September 27, 1873.

To be secured over the belt-hole, and prevent rubbish and dirt from falling through the belt-hole upon the floor underneath.

Claim.—An improved belt-hole cover, formed of the parts A a^1 a^2 a^3 a^4, B b^1 b^2 b^3 b^4, and C c^1 c^2, said parts being combined to operate in connection with each other, substantially as herein shown and described.

144,145.—Pad for Pile-Trusses.—John L. Rowe, New York, N. Y., assignor to himself and Jacob A. Shermann, same place. Application filed September 25, 1873.

A hollow pad, of rubber, is inflated and held against the rectum by suitable attachments. It is furnished upon one of its sides with a pocket to hold medicaments.

Claim.—1. The inflated rectum-pillow made with loops *f f* for connecting the same to the straps, the parts being constructed and applied substantially as set forth.

2. The rectum-pillow and pocket, combined substantially as set forth.

144,146.—Corn-Ground Marker.—James H. Rykerson, Clayton, Ind. Application filed June 28, 1873.

The frame consists of a center beam, the front end of which rests upon a center-wheel, and the rear end carries a cross-beam and handles. Two diverging curved beams are bolted near the middle of center beam, their free extremities being furnished with a furrow-opener and a foot-piece to smooth the bottom of the furrow.

Claim.—1. In a corn-field marker, the detachable and adjustable guide or auxiliary marker H, substantially as specified, and for the purpose mentioned.

2. The marking-plow K and auxiliary marker H, united together by a bolt, in combination with the pivoted and slotted standard G, side braces E, and brace-rods P, substantially as specified.

144,147.—Instrument to Loosen Dried Fruits.—John F. Schmeltzer and Joseph M. Roberts, Winona, Minn. Application filed May 3, 1873.

Two spiral prongs turn in the same direction, and united at the upper parts in a shank and handle.

Claim.—The fruit-loosening instrument, consisting of two opposite spiral prongs turning in the same direction, and gradually expanding to encompass a cone-shaped space, said prongs being tapering in form to their points, and united at their upper ends into a shank having a cross-head, substantially as shown and described.

144,148.—Sounding-Plate for Musical Instruments.—Albert Schoenhut, Philadelphia, Pa. Application filed October 2, 1873.

The pieces or plates are cut from rolled bar-iron of the proper length, and then rapidly revolved, first with gravel and then with sawdust, to remove the scale but not the outer skin of the plates.

Claim.—A sounding-strip consisting of wrought-iron treated in the manner described.

144,149.—Building-Block.—Raphael M. Seldis, New York, N. Y. Application filed September 27, 1873.

Claim.—A building block made in the form of a cube or parallelopipedon, in two or more segments, fitted together by tongues and grooves, or by dowel-pins and sockets, with or without the tongue *g* and groove *h*, substantially in the manner herein shown and described.

144,150.—Apparatus for Depilating Animal Carcasses.—David H. Sherman, Jersey City, N. J. Application filed January 27, 1873.

A cylindrical apparatus having interior spring-arms converging toward the center. The animal is lowered into and through this cylinder.

Claim.—1. The hog-cleaning apparatus consisting of the vertical receiving and delivering cylinder, armed on its interior with downwardly-inclined scrapers, as herein shown and described.

2. The open trunk or conduit herein described, suspended from a scalding table or floor, and having a receiving-table at its lower end, upon which the cleaned carcass is delivered by the momentum of its own gravity, substantially as described.

3. The spring stripping-arms provided with spoon-shaped acting points to prevent injury to the skin, as herein shown and described.

4. In combination with the vertical trunk, provided with scrapers, as herein described, the endless hooked chain, as and for the purpose specified.

144,151.—Combined Frier and Broiler.—George Smith, Williamsburg, N. Y. Application filed March 19, 1873.

This broiler is composed of a vessel with a hinged lid and an interior perforated flange, upon which rests a gridiron having grooved bars and a nozzled edge, its handle projecting through the wall of the vessel.

Claim.—The broiling device herein described, consisting of the vessel A with its hinged lid, perforated rim D, and the broiler G with grooved bars and nozzle, constructed as shown and described, as and for the purpose specified.

144,152.—Machinery for Making Clothes-Pins.—John B. Smith, Sunapee, N. H. Application filed September 12, 1873.

The blanks, being fed on an endless belt automatically to the lathe-heads, are grasped and turned to the proper outline, and released to drop out below.

Claim.—1. The combination of the shaping-knife A, swinging knife-bed H, the adjustable lifting-and-lowering rod H^2, lever I, and cam F with a suitable frame, A, substantially as and for the purposes described.

2. The combination of the automatically-swinging knife-bed H, chamfer-cutter *i*, and rider-gage *i′*, substantially as and for the purposes described.

3. The automatic uncentering-hammer 5 and its operating connections G *g g′*, substantially as shown, and for the purpose described.

4. In a clothes-pin machine, the automatically-oscillating feed-table L′, in combination with the spindles C C^1, as and for the purposes set forth.

5. The endless feed-belt *l′*, in combination with the oscillating table L′, ratchet-wheel M, counterbalanced pawl *l*, and frame L, all constructed, arranged, and operating substantially as and for the purposes described.

6. The shaping-knife A, oscillating spindle C, movable stop J *j*, uncentering-hammer 5, endless feed-belt *l′*, oscillating feed-table L′, all combined and automatically operated substantially as and for the purposes set forth and described.

144,153.—Locket.—Samuel J. Smith, New York, N. Y. Application filed July 2, 1873.

Claim.—The combination of the two frames A A, secured together by the pins *e* and *f*, the box pivoted thereto by the pin *e*, as described, the stop piece *a* abutting against the pin *f*, substantially as and for the purpose herein specified.

144,154.—Sawing-Machine.—Edward H. Stearns, Erie, Pa. Application filed April 14, 1873.

The material is fed through the machine by rotating serrated disks suspended above and acting upon the material between the saws of the gang.

Claim.—1. The sheet-metal toothed disk or disks D′, arranged relatively to and in combination with the circular saws D, and operative conjointly therewith, substantially in the manner and for the purposes set forth.

2. The combination of one or more disks, D′, swinging frame H, arbor *d*, and gear-wheels d^1 d^2, relatively arranged substantially as set forth.

3. A guide or gage, *e*, having an inclined slot, e^2, at its rear end, in combination with a pin, *i*, and a recess in the feed-table, having an incline, *e*, substantially as set forth.

144,155.—Rotary Shears for Metal.—Melvin Stevens, Brooklyn, N. Y. Application filed September 9, 1873.

The cutting rings or disks are kept in contact by an end pressure applied to the ends of the rollers, and are so arranged as to carry one edge of each strip down and the other edge up.

Claim.—The rotary shears, made of two rollers, each formed with a shaft, cutting-rings, and intermediate cylindrical washers, when the shears are arranged, as set forth, to carry one edge of each strip down and the other edge up, and the cutters are all kept in contact by an end pressure given to one of the rollers, substantially as set forth.

144,156.—Hand Shower-Bath.—David Stirling, Eaton Rapids, Mich. Application filed August 11, 1873.

A perforated rose-head with a vent-tube is connected to a tapered sleeve adapted to fit over the neck of a bottle, the whole forming a hand shower-bath, which, when inverted, delivers a supply of air through the tube on the top of the fluid, so that it will flow freely out of the rose.

Claim.—The tube *a*, in combination with the rose A of a hand showering-vessel, substantially as described and shown.

144,157.—Self-Adjusting Telegraph-Relay.—Joseph H. Stowell, Winona, Minn. Application filed July 9, 1873.

Steel rods D pass through perforations in armature C, both being attracted by the magnets A. C and D are connected to opposite ends of a rocking-spring, E. Thus the tension of *s* is always proportionate to the strength of the current acting in the magnets.

Claim.—1. The combination of the magnets A, perforated armature C, wires D supported on suitable rocking post, spring E, and suitable connecting-cords, substantially as set forth.

2. In combination with a relay-magnet, a rocking spring, E, connected to two distinct armatures operated by one magnet, substantially as set forth.

144,158.—Evaporating-Pan.—George W. Storer, Philadelphia, Pa. Application filed October 14, 1873.

A steam-heated pan having wooden sides is constructed in sections for convenience of manufacture and transportation.

Claim.—1. The wooden sides E, fitted into the groove *e″* of the bottom A, and secured to or within said groove by means of the bolts H and caps I, substantially as and for the purpose specified.

2. In combination with the mitered ends of the side pieces E, the angle-plates F and bolts G, substantially as and for the purpose shown.

3. The hereinbefore-described evaporating-pan, having a sectional hollow metal bottom and wooden sides, said parts constructed and combined in the manner and for the purpose substantially as specified.

144,159.—Evaporating Pan and Plant for Salt Manufacture.—George W. Storer, Philadelphia, Pa. Application filed September 30, 1873.

A series of tanks, pans, and a drier are arranged conveniently around a boiler or other steam supply. The brine is heated and cooled in the tanks to deposit impurities transferred and evaporated in the pans, the salt removed to the drier, where it is showered with saturated brine, and subjected to air-currents induced by an exhaust connected with the bottom of the drier.

Claim.—1. The vessel D, provided with a reticulated bottom, *d*, and the base E, provided with the chamber E′ and waste-opening H, constructed and combined with each other, and with suitable water-showering and air-exhausting apparatus, substantially as and for the purpose shown.

2. The precipitating-tanks C and C′, the evaporating-pans B and B′, the drier D and E, and the showerer I, arranged as shown, and combined with suitable steam-generating and air-exhausting apparatus, substantially as and for the purpose shown and described.

144,160.—Paper-Folding Machine.—Robert J. Stuart, Yonkers, N. Y. Application filed November 16, 1872.

The paper is fed by belts over a folding-knife, which, rising, doubles it through the jaws of the lower nippers into the bight of the upper nippers, which, rising, extend the doubled sheet in vertical position, when the lower nippers seize its lower edge. The two pairs are now swung together, folding the sheet a second time. A horizontal knife now advances to form the last fold, the nippers being released, and deliver the sheet onto the tapes, which feed it out.

Claim.—1. In combination with the tapes C to advance the sheet, the folding-knife M, and jaws K L and *r r*, G H and *p p*, (one of which is adjustable to make the first fold,) constructed and operating substantially in the manner described.

2. The combination, with the knife M and jaws *r r* K L, of the nippers *p p* G H, for holding the sheet in position for the second fold, constructed and operating substantially in the manner described.

3. The combination, with the folding-knife M, jaws *r r*, and nippers *p p*, of the swinging arms G H and K L, for making the second fold, constructed and operating substantially in the manner described.

4. The combination of the nipper-arms K L with the jaws *p*, to form the bight or double for the third fold, substantially in the manner described.

5. The combination, with the swinging arms G H K L, jaws *r r*, and nippers *p p*, of the knife P for completing the third fold, substantially in the manner described.

6. The nippers *r* and *p*, constructed to automatically hold and release the sheet, substantially in the manner described.

144,161.—Elevator.—Jerome B. Sweetland, Pontiac, Mich. Application filed September 9, 1873.

One end of the guide-rod is attached to a lever which engages with a rack secured to the frame. A peculiar-shaped frame is combined with the carriage, by means of which wheelbarrows may be held securely while being elevated.

Claim.—1. The combination, with the beam A and windlass-bed C, of the guides B B, levers D D, and ratchet-bars *a a*, substantially as and for the purposes herein set forth.

2. The hooked arms G G, constructed as shown, and hinged or pivoted to the carriage E, substantially as and for the purposes herein set forth.

3. The combination of the beam A with pulleys *n n*, guides B B, carriages E E, rope *m*, and the windlass, all constructed and arranged substantially as and for the purposes herein set forth.

144,162.—Stopping Mechanism for Drawing-Frames.—Jerome C. Taft, Pawtucket, R. I. Application filed August 18, 1873.

Should the sliver break, the trumpet and its lever will fall and raise the clutch, so that the dog will be caught and held by one of the smaller clutches, and the machine be stopped. A bench in the sliver causes the clutch to be lowered, with a like result.

Claim.—The combination, with the trumpet *a* and its lever *g*, of the semicircular clutch *b*, containing the smaller clutches *c*, *d*, *e*, and *f*, and the rotating dog *w*, all in the manner and for the purposes described.

144,163.—Elastic Connection for Flexible Tubing.—William B. S. Taylor, New York, N. Y. Application filed October 15, 1873.

The elastic connection has a varying internal diameter, and its largest end is of sufficient length to turn back and lap over the binding-cord, to make a neat joint.

Claim.—The elastic connection for flexible but inelastic tubing, constructed and adapted to be fitted and secured to said tubing, as herein shown and set forth.

144,164.—Saddle-Tree.—Andrew Teas, Cincinnati, Ohio. Application filed February 8, 1873.

Claim.—A saddle-tree having the flanges *f* and alternate raised and sunken recesses B D, substantially as and for the purpose specified.

144,165.—Portable Fence.—Clayton A. Thomas, Bellbuckle, Tenn. Application filed August 16, 1873.

To an inclined brace, having its lower end on the ground and its upper end bearing against the second rail from top, are secured two short braces, which incline upwardly and downwardly, and, after passing between two of the central rails, cross each other to form a locking device.

Claim.—The triangular brace consisting of the post D and extensions G G, having the notches or depressions *a a′* for fastening between two adjacent rails of the fence-panel, substantially as and for the purposes specified.

144,166.—Child's Carriage.—William H. Towers, Boston, Mass. Application filed September 30, 1873.

Claim.—1. The guiding and driving shafts B, formed in the the shape of sled-runners, and attached at one end to the movable axle C, and having a bar, *d*, pivoted to their ends, so as to allow one of the shafts to be pushed forward and the other drawn back, as and for the purpose set forth.

2. The shafts B, connected by a bar, and adapted to be used as the driving and guiding shafts of a carriage, or as runners for a sled, as set forth.

3. The guiding and propelling shafts B, in the form of sled-runners, with a loose connection with one axle and a fixed connection with the other, substantially as and for the purpose set forth.

4. The braces *g* and handle H, of the form shown, combined with the body A and levers B, to convert the carriage into a sleigh, as set forth.

5. The carriage formed by combining the removable and reversible body A with the pole *b*, guiding-levers B, and running-gear, as set forth.

144,167.—Fall for Parlor-Organs.—William O. Trowbridge, Newton, assignor to Mason and Hamlin Organ Company, Boston, Mass. Application filed September 25, 1873.

A front fall or lid for covering the keys, consisting of a quarter section of a hollow cylinder, supported and swinging upon radial arms pivoted at each end of the key-board.

Claim.—A parlor-organ or similar instrument having a rigid curved fall, *d*, fixed to arms *h*, and pivoted to operate substantially as described.

144,168.—Hammock-Support.—Otis Tufts, Boston, Mass. Application filed August 16, 1873.

Two pairs of rods, each rod sliding on the other to the distance between the floor and ceiling, into which position they are

clamped by a lever having pawls working into a ratchet on the upper rod. These levers are hinged to a coupling-box fastened to the upper end of the lower rod, and also subserve the purpose of counteracting the strain of the hammock, which is attached to a hook on the upper end of each.

Claim.—1. The combination of the rods *a b*, couplings *c*, hooks *n*, and rods *e*, connected and operating to support a hammock, substantially as shown and described.

2. In combination with the rods *a b*, coupling *c*, and its locking-pawl, the buttons A *h*, substantially as described.

3. In combination with the rods *a b*, the brace-rod *o*, and its lifter-pawl *p*, and the coupling *c* with its supporting-pawl *f*.

144,169.—Oyster and Other Dredges.—Joseph Walker, Ludlow, Ky. Application filed August 27, 1873.

A dredge for gathering coals, oysters, &c., by a combined pitch-fork and pointed spade-frame attached to the mouth of a chain or other bag for collecting the loosened-up materials.

Claim.—The described dredging-scoop, consisting of the metallic frame A *a* C C′, converging bars F F′ G, forwardly-projecting prongs I I′, chain bag or basket H, suspending-bail D, and handle B, when arranged and adapted to be operated in the manner explained.

144,170.—Scarf-Clasp.—A. Richard Weiss, Brooklyn, N. Y. Application filed August 20, 1873.

Plates of spring-metal, one of which is bent over the other at its edges, are placed inside of the loop, and hold it in place on the free ends of the scarf by compression.

Claim.—A scarf-slide provided in its interior with two elastic blades, *a a′*, constructed substantially as described, for compressing and confining the free ends of a scarf when inserted therein, as set forth.

144,171.—Pump.—Edward Carlile Wharton, Philadelphia, Pa. Application filed October 9, 1873.

To free the pump from water, two arms are placed on the dividing-plate, which raise the upper valves on the full stroke of the seat-plate. The lower valves are raised by chains, which connect them to the seat-plate.

Claim.—1. The arms H, adapted to open the valves B on the full stroke of the seat-plate, as set forth.

2. The connections J of the seat-plate and lower valves, adapted to open said valves on the full stroke of the seat-plate, as set forth.

3. The arms H and connections J, in combination with the seat-plate and the upper and lower valves, substantially as and for the purpose set forth.

144,172.—Paper-Machine.—Charles Whealen, Dayton, Ohio, assignor to himself and Calvin L. Hawes. Application filed September 11, 1873.

The wire-cloth apron is above the felt. The weighted roller Q serves to cleanse this apron.

Claim.—1. The wire-cloth apron O, stretched around the upper pressing-roller P, and rollers S T, in combination with the felt D and lower pressing-roller I, as and for the purposes shown and described.

2. The weighted deflecting-roller Q, in combination with the apron O and rollers P S T, as shown and described.

3. The shield X, in combination with the apron O, roller P, and felt D, as set forth.

144,173.—Gaiter.—Mortimer M. Wheeler, Galena, Ill., assignor of one-half his right to James Jones, Dodgeville, Wis. Application filed May 9, 1873.

The upper portion of the quarters is made of a single piece of leather, and is secured to the seamless upper, which has a tongue or stay-piece turned up at the outside of the heel.

Claim.—The seamless piece D, in combination with the upper A, made in one piece, and provided with an opening and with a tongue at its heel, said tongue being turned up and sewed to the seamless leg-piece to stiffen and strengthen it, substantially as described.

144,174.—Steam-Engine Valve-Gear.—Jerome Wheelock, Worcester, Mass. Application filed July 10, 1873.

A cut-off valve and valve are each operated by a valve-spindle which partially rotates on its axis, and are combined with a latch-link for connecting the two valves, and a cam-lever which, by the governor, is made to control the connection of the latch-link with the cut-off valve. The valves are provided with hardened journals and fitted to hardened bushings in the bonnet. The valve-spindle has an inclined shoulder bearing against the inclined end of the bushing for adjusting.

Claim.—1. A cut-off valve and a valve which controls the induction of steam from the cylinder, each of which is operated by a valve-spindle, which partially rotates reciprocally on its axis, in combination with a latch-link for connecting the two valves, and a cam-lever which, by the movement of the governor, is made to control the connection of the latch-link with the cut-off valve, substantially as described.

2. A double-acting valve for controlling the induction and eduction of steam to and from the cylinder, and a cut-off valve, each arranged to be operated by a reciprocally-rotating valve-spindle, in combination with a latch-link which connects the two valves, and a cam-lever controlled by the governor, and arranged to effect a disconnection of the latch-link with said cut-off valve, substantially as described.

3. The combination of a semi-rotating valve with a hardened journal fitted thereto, and hardened bushings fitted to the bonnets F, and to receive the journals, substantially as described.

4. The combination, with the bonnets F and the valve-spindles, of the longitudinally-adjustable bushings, substantially as described.

5. The combination of the valve-spindle with the inclined-faced shoulder adjacent to its inner end near the head of the valve, and the bushing, which is provided with a recess at the end for receiving the shoulder, substantially as described.

6. The combination of the eccentric bolt *k* with the latch-link and its actuating crank-lever, substantially as and for the purposes described.

144,175.—Faucet.—Joseph White, Philadelphia, Pa. Application filed August 29, 1873.

A bifurcated spring is arranged to press downward upon the grooved plug of a faucet, said spring being held in place upon a threaded stud on the body of the faucet by means of a screw.

Claim.—1. The spring F, having a bifurcated end, as shown, in combination with the grooved faucet-plug D and faucet A, substantially as and for the purpose specified.

2. In combination with the faucet having the spring F arranged to press upon the plug D, and the screw *c* to hold said spring, the threaded stud *c′* upon the body B, as and for the purpose specified.

144,176.—Loom Shedding Mechanism.—Isaac L. Wilber, Taunton, Mass. Application filed August 16, 1873.

In combination with upright heddle-levers, each provided with two arms at or near its pivotal point, so arranged as to embrace and to be positively operated by the rolls of a pattern-chain, horizontal notched spring-arms, loosely pivoted near the upper ends of the heddle-levers, are so arranged as to lock said levers when in their extreme position, and after the shed is formed.

Claim.—The notched spring-levers *e*, in combination with the upright harness-levers *d*, arms *l m*, and pattern-chain, and operating substantially as described.

144,177.—Cap for Scissors-Points.—Carrie W. Williams, New York, N. Y. Application filed September 22, 1873.

A rubber cap is connected by a cord and suitable catch to the bows of the scissors, and is used to protect the scissors-points from injury.

Claim.—The combination of the elastic cap B, the cord C, and catch *c′* or its equivalent, all as described, for the protection of the points of the scissors.

144,178.—Watchmaker's Lathe.—Charles V. Worrd, Waltham, Mass. Application filed April 16, 1873.

A sliding sleeve, with conical interior, is forced over a set of chuck-jaws of corresponding exterior by a powerful spring, and drawn back, when it is desired to release the jaws, by means of a combination of levers and treadle.

Claim.—1. The combination and arrangement of the gage-clutch *l*, sleeve *m*, nut *q*, spring *r*, mandrel *f*, and nut or collar A, substantially as shown and described.

2. The combination of the sliding clutch-sleeve *m*, spring *r*, for throwing forward said sleeve to close the chuck, the lever *t u*, link *v*, and lever *w n*, as and for the purpose set forth.

REISSUE PATENTS.

5,627.—Cooking-Stove.—James Easterly, Detroit, Mich.—Patent No. 113,643, dated April 11, 1871. Application filed July 19, 1873.

A portable cylindric magazine has an elliptical base extended laterally to feed fuel to an oblong fire-box. Attached to it, so as to cover several boiler-holes, is a curved base containing illuminating windows.

Claim.—1. A portable magazine-feeder for a stove, provided with a supporting-base, B, which is in form similar to a segment of a hollow cylinder or a segment of a hollow elliptical figure, and adapted for covering a plurality of boiler-holes, the said base being attached to and removable with the magazine-feeder, substantially as described.

2. The reservoir A of the portable feeder, constructed with a lower laterally-extended end, C, for evenly distributing the fuel in an oblong fire-box, substantially as described.

3. The combination of the windows *c* with a portable magazine, A, substantially as described.

4. In a portable magazine-feeder, the combination of a magazine which is circular in horizontal section along a portion of its length, and elliptical in horizontal section along another portion of its length, with a crown-shaped base which is attached to the magazine and portable with it, substantially as and for the purpose described.

5. A portable base-burning fuel-supplying apparatus, with a jacket around its magazine, holes *n n*, and apertures *p p*, substantially as shown and described.

5,628.—Harness-Pad.—John Hughes, Newark, N. J.—Patent No. 91,747, dated June 22, 1869. Application filed August 5, 1873.

Claim.—1. The plate B, fastened to the frame by a socket and by a screw, F, in combination with the nut C for holding the hook A, substantially as described.

2. The frame E for a harness-pad, with depressions in its upper and under sides for the reception of the plate B and nuts G for the terrets, as described.

3. The welt N, secured upon the bottom pieces O P by a single seam in a flat condition before being applied to the pad, in the manner and for the purpose specified.

4. In an iron frame for harness-pads, the holes L L, through which to pass the nuts after the pad is made up, substantially as described, for the purpose specified.

5. The removable plate K for closing the openings at I, as described, and for the purposes set forth.

5,629.—Harness-Pad.—John Hughes, Newark, N. J.—Patent No. 74,691, dated February 18, 1868. Application filed August 5, 1873.

Claim.—1. In an iron frame for a harness-pad, as described, the socket or recess for the nut H of the check-rein hook, as and for the purposes set forth.

2. In combination with the frame, as described, the strips B B for attaching the bottom and binding to the frame, substantially as described.

3. In combination with the iron frame of a harness-pad, the flexible pieces or foundations F, as described.

4. The braces K K, or their equivalents, as and for the purposes specified.

5. The binding and the bottom piece, stitched together in a flat condition before being applied to the frame, in combination with an interposed form, substantially as described.

6. The frame A, provided with recesses E E for screw-nuts, and with or without the rabbets B B, and holes V V, as and for the purpose set forth.

5,630.—Coupling and Steering Apparatus.—John McCreary, Middletown, Pa.—Patent No. 129,844, dated July 23, 1872. Application filed October 11, 1873.

Claim.—1. The combination of the two boats A and B, the steering-chain *c*, passing around sheaves or pulleys, and around the windlass C, or its equivalent, the overhanging guard or bumper on the stern of the forward boat, and the chain D attached to opposite points on the stern of said boat and to the stem or central part of the bow of the rear boat, so as to form a universal joint between them, and keep them coupled and centered, substantially as shown and described.

2. In combination with the boats A and B and the coupling and steering mechanism herein described, the claw-hooks A A, for attaching and adjusting the coupling and steering chains, substantially as set forth.

5,631.—Revolving Fire-Arm.—Jacob Ruperteus, Philadelphia, Pa.—Patent No. 43,906, dated July 19, 1864. Application filed May 9, 1873.

A detachable extracting-pin is arranged in the tubular base-pin, upon which the cylinder revolves. A rotating recoil-plate, E, is arranged in rear of the cylinder, which has a notch upon its edge, through which the nose of the hammer strikes the cartridge. It also has a gate upon its side, through which the cartridges are introduced into the cylinder, which, when closed, prevents them from falling out. A spring on the front side of the trigger extends up and engages with notches on the rear face of the plate to hold it in the position desired.

Claim.—1. The combination, in a fire-arm having a many-chambered revolving cylinder or barrel, of a fixed tubular base-pin and a detachable shell-discharging pin, as specified.

2. A breech-piece, E, intervening between the rear end of the barrel and the frame, and arranged to turn substantially as set forth.

3. The notch *m*, formed at or near the edge of the said breech-piece, as set forth, for the purpose specified.

4. The combination of the said movable breech-piece with the door G or its equivalent.

5. The said movable breech-piece, with its notches *t* and *q*, in combination with the spring I.

5,632.—Apparatus for Teaching Music.—Lewis A. Seward, San Francisco, Cal.—Patent No. 96,151, dated October 26, 1869. Application filed September 16, 1873.

An upright frame, supporting bars representing one or more music-staves, has at the bottom a key-board sufficiently raised to be readily visible, and which may or may not be connected with the manual of an instrument which will sound the tones of the respective keys upon their being pressed.

Claim.—1. A musical staff, D E F G H, constructed as described, provided with the wires *i* or equivalent, in combination with movable notes and rests, substantially as and for the purpose herein described.

2. The combination of an upright or partially upright supplemental key-board with the ordinary horizontal key-board of pianofortes or other like instruments, when the former is used in connection with vertical standards *c c*, on which are fixed transverse bars D E F G H, and front elastic strips *d e f g* h, provided with mechanical appliances for attaching removable notes, rests, &c., and means of connection with the horizontal keys of the instrument, substantially as herein described.

3. The frame C, having the cross-bars D E F G H, with or without the front strips *d e f g* h, and provided with the upright or partially upright key-board, when the parts are constructed substantially as described, and for the purpose specified.

4. The combination of upright or partially upright supplemental key-board with a horizontal key-board, when the two are connected by links and trackers, or equivalent connections, substantially as and for the purpose described.

5,633.—Mode of Attaching Knobs to Screws.—Charles H. Trumbull, Marlborough, N. H.—Patent No. 77,350, dated May 5, 1868. Application filed October 6, 1873.

A screw-shank, of uniform size throughout, has a gimlet-point at each end, and a groove or slot running along one side. One end of this screw is passed into the knob, and keyed securely therein by a wedge inserted in the slot. The other end is then turned into a drawer or other article to which a knob is to be attached.

Claim.—1. A knob attachment, consisting of a screw, as represented, without any central projection or shoulder, having gimlet-points at its opposite ends, and a groove arranged with and in the thread, substantially in manner, and for reception of a key, as specified.

2. A knob, composed of a head or body, B, a grooved screw, A, and the key C, all constructed and arranged substantially as set forth.

5,634.—Machine for Thrashing and Hulling Clover.—James Bradley and James Nicholas, Gomer, Ohio.—Patent No. 138,556, dated May 6, 1873. Application filed August 30, 1873.

A part of the feed-board may be adjusted so as to direct the grain to the shoe or to the hulling-cylinder, as may be desired, and is connected to the roller of the endless carrier by means of a crank and connecting-rod, by which it receives oscillations to prevent choking.

Claim.—The combination of the crank K, connecting-rod L, and crank M with the feed-board J and the roller of the straw-carrier, substantially as specified.

5,635.—Die for Cutting out Ornamental Forms of Paper.—Adolph Dalkemamp, Brooklyn, E. D., assignor to Jacob J. Nicholl, New York, N. Y.—Patent No. 137,063, dated March 25, 1873. Application filed August 21, 1873.

The female or pattern die A is of soft metal, while the male die B is of hard. The pattern-die is supplied with many slender pins protruding through it and flush with its face, which are pushed up as the dies are brought together, and, descending by gravity as the dies separate, force out the delicate figure of paper. The waste material in the male die is removed by similar pins mechanically raised.

Claim.—1. A pair of matched cutting-dies, one of hard and the other of soft metal, operating together to cut paper and analogous material, as herein specified.

2. In combination with dies A B, operating as specified, the clearing-pins *m*, sinking out of the way when the dies are acting, and protruded when the dies are separated, so as to expel the thin material by acting on thickly-distributed points on its surface, as herein specified.

5,636.—Manufacture of Steel Castings.—William Kelly, Louisville, Ky., assignor of one-half interest to Thomas C. Coleman.—Patent No. 122,253, dated December 26, 1871. Application filed January 21, 1873.

Claim.—1. The process herein described of preventing cracking, porosity, or other defects in steel castings by the employment of copper, or its equivalent, in a mold of sand, or other suitable material, substantially as herein set forth.

2. The process of pouring fluid steel into a mold while in a vertical position, with its thinnest edge uppermost, having the pouring-gate fixed thereon, and turning the same soon after pouring into a horizontal position to allow it to cool, substantially as and for the purpose set forth.

3. The flask mounted on journals, substantially as described, so that when turned over, the clamps being released, the drag, with the castings, will be thrown forward and thus free the casting from binding.

4. In the apparatus, the combination and arrangement of the flask with the floor-frame, the copes, the clamp-bar, set-screw, and trigger, all constructed substantially as described, for the purpose set forth.

5,637.—Mold and Core for Casting Steel.—William Kelly, Louisville, Ky., assignor of one-half interest to Thomas C. Coleman.—Patent No. 132,637, dated November 5, 1872. Application filed January 21, 1873.

Claim.—1. In combination with a copper flask or mold, or the equivalent of copper, the employment of sand, spring-metal, or any other suitable yielding cores, substantially as and for the purposes set forth.

2. The detachable gate and stirrup, substantially as and for the purpose set forth.

3. The tongs, center-fastenings, and steady-pins, substantially as and for the purpose set forth.

5,638.—Magic Lantern.—Lorenzo J. Marcy, Philadelphia, Pa.—Patent No. 92,330, dated July 6, 1869. Application filed May 31, 1873.

A magic lantern having a flame-chamber with its walls separate from the outer shell, and with transparent ends. Apertures in the bottom and top of this chamber allow the entrance of air and the escape of the products of combustion and heated air. Between the flame-chamber and lens-tube and reflector are air-passages.

Claim.—1. In a magic lantern, an outer case constructed substantially as described, with an opening through its top for the passage of the chimney, and with flanges attached to the chimney, forming the only connection between the two, to prevent overheating and leave an air-space between the case and chimney, as set forth.

2. The combination, substantially as set forth, of the outer case and its flanges with the inner case and its chimney, whereby the inner case is attached to the outer one above the flame-chamber through the medium of the flanges only, for the purposes specified.

3. The combination, substantially as described, of the open base, the open-bottomed tubular outer case, elevated above the base and connected thereto by short side flaps only, and the open-bottomed inner case, connected to the outer case by side flaps, to afford a firm support to the inner case, prevent overheating, and leave an air-space between the cases, as set forth.

4. The construction of a case, substantially as set forth, with a slotted diaphragm or deflector-plate, dividing it into a lamp-chamber and flame-chamber.

5. The combination, substantially as set forth, of a case, a slotted diaphragm or deflector-plate, and a lamp (without chimney or case) sliding under said diaphragm or deflector-plate.

6. The combination, substantially as set forth, of the flame-chamber, the chimney, and its deflecting-flanges, for the purposes specified.

7. The combination, substantially as set forth, of the lamp, the ribbed slotted diaphragm or deflector-plate, and the perforated metal screens under said ribbed portion of the lamp, to secure a bright, steady flame.

8. The construction, as set forth, of the base, the outer case, and the inner case with openings in their ends, constituting a lamp-chamber.

9. The base constructed as described, with guides or ways in which the lamp-case slides and is held.

10. The connection of the objective tube and base by means of pins *f*, loops *l*, and a spring-hook, *h'*, substantially as set forth.

11. The flame-chamber having glass ends, arranged so that an air-passage having an outlet, *p*, is left between the front glass H' and the lens-tube.

12. In a magic lantern, a flame-chamber constructed substantially as hereinbefore set forth, with opaque walls and transparent ends, and with openings for entrance of air and for the escape of the heated products of combustion, whereby a clear, steady flame is obtained without the use of a glass chimney.

INDEX OF INVENTIONS PATENTED OCTOBER 28, 1873.

	Class No.	Whole No.
Accordion, &c., Goetz and Müller	102	144,025
Ants, process of destroying, Dewey and Dreyer	63	144,075

DIGEST OF FOREIGN PATENT LAWS.

SAXONY.

Report of Mr. J. H. Burnley, of the British Legation.

In compliance with your lordship's circular instructions of the 14th August, 1872, on the subject of the patent laws of Saxony, I have now the honor to report to your lordship the views of the Saxon government in this matter.

Baron Friesen, in a note addressed to me on this subject, gives the opinion of his government as follows:

"Considering the small extent of territory over which the legal effects of a Saxon patent extend, its owner will generally not derive much benefit, unless he has, at the same time, taken out one in Austria, Prussia, and the other great states. Another serious drawback is this, that, owing to this small extent of territory, descriptions of inventions are never published at once in Saxony, in order to allow the patentee time to obtain a patent in the neighboring states. This he is obliged to do if he wishes to secure a larger field of operation; otherwise his invention would soon be imitated in these states. As a natural consequence, it happens that Saxon manufacturers never know for certain and early enough for what inventions patents have been already secured in Saxony. With this exception the working of the patent laws has proved to be generally satisfactory.

"The number of patents taken out has been continually increasing; but so has the number of lawsuits; and it occurs now much more frequently than formerly that patents have to be canceled. The difficulty of deciding what is really a new invention is continually increasing. At the same time the majority of patents taken out every year are not by Saxons, but by Englishmen, Americans, and Frenchmen.

"Generally speaking, the opinion of Saxon manufacturers is much less in favor of patents than it used to be. Of the five chambers of commerce existing in Saxony, three (those of Leipzig, Zittau, and Plauen) have decidedly pronounced themselves in favor of an abolition of the patent laws, because they maintain that the advantage derived from them by individuals is much less than the injury which they do to free trade.

"The Dresden chamber of commerce is likewise more against patents than in favor of them, while the Chemnitz chamber, which represents chiefly the interests of the owners of iron foundries, alone advocates the maintenance of patents, with this proviso, however, that they should, in future, take effect throughout the whole extent of the German Empire; that the inventions for which they are taken out should be previously examined, and that full publicity should afterward be given to them. All, however, agree that it would not do for a small manufacturing state like Saxony to be the first to introduce changes into its legislation on this subject.

"Altogether the Saxon government is of the opinion that patents of invention are not of such great moment, either for good or for evil, as many people suppose. It is, therefore, thought that the decision on the question, either way, should be deferred until public opinion pronounce its final verdict, and that it should be left to the imperial government to take the lead in the matter, especially as the legislation on patents has in any case been assigned to the Empire. If, therefore, imperial legislation should some day decide upon the abolition of patents, whether by coming to an understanding on the subject with England and the United States or not, the conviction is generally entertained that this measure would not do any serious harm to industry."

I have the honor further to inclose two copies with translation of the patent laws of Saxony.

Inclosure 1.

Order in council of January 20, 1853, concerning the granting of patents of invention.

Section 1. Patents are granted only for such objects of industry which are really new and peculiar—that is to say, which, before the day on which the patent is

issued, have neither been produced within the territory of the federal states of Germany nor have been sold or made known there in any way, nor have been described in works published, either in Germany or abroad, in such a manner as to enable any competent person to produce them.

No patents are granted for medical drugs of whatever description; for new methods of preparing medicine; for cosmetics; articles of food, including those articles of luxury destined for consumption; all kinds of samples and patterns, as well as for general scientific fundamental truths.

SEC. 2. Patents may also be granted for improvements made upon articles which have already been patented; however, as long as the patent taken for the original invention is in force, the person who has introduced an improvement of the same can only avail himself of his patent if he has acquired the right of making use of the first invention from the original patentee.

SEC. 3. Natives as well as foreigners may apply for a patent. If a foreigner who is not a subject of one of the German federal states applies for a patent, he has at once to mention the name of a Saxon subject, residing in Saxony, who is to be his representative; at the same time, he has to show in his application that this representative of his agrees to undertake this office. The latter is then considered as the patentee in every respect as soon as the patent is granted.

SEC. 4. The rights which a patent confers upon the person who has obtained it, may be transferred to another person. The latter has, however, no right to claim protection for his privilege unless he is a subject of one of the German federal states.

SEC. 5. For an article the inventor of which is a subject of one of the German federal states, and has obtained a patent for it in one of these states, a Saxon patent is granted only to the inventor himself, or to the person who may have succeeded to his rights.

SEC. 6. The patentee has the right to demand that, throughout the Kingdom of Saxony, nobody should be allowed, without his consent, to manufacture the article, or carry out the invention, or apply the method of manufacture, or use the machine or tool for which the patent was taken. This right of prohition by no means extends to the importation of such articles which happen to be like the one that has been patented, or to the sale of the articles patented; nor is it forbidden to make use of the inventions patented, provided they do not consist in methods of manufacture or in machines or tools used for manufacturing purposes.

SEC. 7. This right of prohibition cannot be made use of against such persons who may have become acquainted with the article patented before the patent granted for it was issued. The patent does not, at the same time, confer the right of making a regular trade out of the manufacture or application of the article patented; in this respect the patentee is, on the contrary, entirely subject to the existing general regulations. Moreover, in carrying out his invention, the patentee is, at all events, bound to observe all the general or special rules which have been laid down in this respect with a view of securing public health and safety. In like manner he has to submit to the special directions which it may be thought necessary to issue for the same purpose in his particular case, owing to the peculiar nature of the invention to be carried out by him.

SEC. 8. Every patent is, in the first instance, granted for a period of five years, which begins to run from the day on which the document in question is issued. The latter may, however, be prolonged for another period of five years, if the patentee applies for it at the home office, at the latest, four weeks before the day on which the patent would otherwise expire. He has, in this case, to inclose the patent which he wishes to be prolonged, together with the sum of money to be paid for the prolongation. (See *Order in Council of January* 26, 1866, No. 4.) The latter is then inscribed on the patent itself.

SEC. 9. A patent is granted in Saxony only on condition that the invention for which it has been taken should be carried out or made use of in the Kingdom of Saxony within one year from the day on which the patent has been issued. This respite may, however, be prolonged if the patentee applies for it at the home office at least four weeks before the day on which it would otherwise expire. He has, in this case, to inclose the patent in question, together with the sum of money to be paid for the prolongation of the said respite. (See *Order in Council of January* 26, 1866, No. 2.) At the same time he is obliged to show that he has been prevented from carrying out his invention by obstacles which it was not in his power to remove. The prolongation of the patent is then inscribed on the patent. If the proposed prolongation cannot be granted, the sum of money which had been sent in for it is returned to the patentee, with the exception of the fee to be levied for the sentence to be delivered.

SEC. 10. Every patent ceases to be valid—

(*a*) If the time for which it was granted has expired;

(*b*) If it is canceled. This is done if it can be proved—

(*aa*) That at the time when the patent was granted the article patented was not new and peculiar in the sense of section 1;

(*bb*) That the patentee has rendered himself guilty of making false statements concerning the question to which country he belongs;

(*cc*) That the inventor of the article patented had already taken a patent for it in another German federal state, while the person who has taken the patent in question in the Kingdom of Saxony is neither the inventor himself nor his successor;

(*dd*) That the description and its appendices presented at the home office, according to Section 15, do not contain a complete or correct statement of the invention;

(*ee*) That the invention has not been carried out or made use of in the Kingdom of Saxony within the space of time mentioned in Section 9.

SEC. 11. As the object of the patent is always to be considered as an indivisible one, the patent has to be canceled, even if the circumstances mentioned in section 10 under *aa*, *cc*, *dd*, and *ee* should apply only to a portion of the article patented.

SEC. 12. The circumstance mentioned in section 10 under *aa* is to be considered as not existing if only some individuals have been acquainted with the invention before the patent was granted for it, and have kept their knowledge of it a secret.

SEC. 13. Every one has a right to propose to the home office that a patent should be canceled. He is, however, in such a case, obliged to prove that one of the circumstances mentioned in section 10 under *b* has really occurred. If he cannot prove this, he has to pay the expenses which may have arisen in the matter as far as he has occasioned them. The question whether a patent ought to be canceled or not has to be decided by the home office.

SEC. 14. Applications for a patent to be granted, or for the prolongation of a patent already taken out, or for a prolongation of the time allowed for carrying out an invention for which a patent has been taken, have to be addressed to the home office and to be presented to it. Whoever wants to apply for a patent has to inclose—

(*a*) A description and (according to the nature of the invention) either a drawing or a model of the object for which he wishes to obtain a patent. These must be of such a nature as to enable any competent person to carry out the invention, showing at the same time, distinctly, how far the article in question may be considered as new and peculiar;

(*b*) The amount of the fees to be paid according to No. 1 of the order in council of January 26, 1866. These fees will in no case be returned.

SEC. 15. The applicant is then informed by the home office (a copy of the present order in council being at the same time handed over to him) whether and to what extent his application has been successful or not; in the former case he is, at the same time, summoned to pay, within a fixed space of time, the tax and stamp duty prescribed by the order in council of January 26, 1866, under No. 2. If this sum is not sent in in time, the applicant is supposed to have given up his intention of taking a patent. If, on the contrary, the sum in question is sent in in time by the applicant, the document conferring upon him the patent applied for is immediately handed over to him.

SEC. 16. The granting, prolongation, or canceling of a patent, as also the prolongation of the time allowed for carrying out an invention patented, is published in the *Leipziger Zeitung*.

SEC. 17. The descriptions, drawings, and models sent in by the patentee are carefully kept under lock and key at the home office during the whole time for which the patent is granted. After the expiration of the same, or if the patent is canceled, the home minister has a right to dispose of them as he pleases. In particular he is, in such a case, entitled to publish them.

SEC. 18. Every patentee is entitled to demand from the authorities protection against all encroachments upon the privilege which his patent confers upon him in accordance with section 6 of this order in council.

The means of coercion to be employed for this purpose, as well as any other measures which may be thought necessary, are the same as those which, according to law, are to be employed in the case of other industrial privileges having been encroached upon, as far as the peculiarities of the case do not necessitate a modification of the same. If a person accused of having encroached upon the rights of a patentee denies the truth of this assertion, either on the ground that the article or the industrial process which have been designated as an encroachment upon the privilege of the patentee are not identical with the article or industrial process for which the patent has been taken out, or because he (the accused) thinks he has a right of impeaching the validity of the patent, contending that it is either altogether null and void, or, at least, with regard to the special point in question; and if the dispute becomes thus one of those controversies which, according to the law of January 30, 1835, sub. D, are to be decided by the administrative authorities, the proceedings prescribed by law for matters of this kind are to be instituted. The authorities have then to decide, according to the particular circumstances of the case, whether the administrative measures taken for the protection of the rights of the patentee shall, for the present, be revoked, or whether they shall be provisionally maintained until the point in dispute has been settled.

SEC. 19. If the question whether the article in dispute is identical with the article for which a patent has been taken, cannot be decided without consulting the descriptions, drawings, and models deposited at the home office, the latter are to be handed over to the competent authorities upon their demand, all those measures of precaution being at the same time taken which the peculiarities of the case may seem to warrant. If the said authorities require to hear the opinion of experts in order to enable them to pass a judgment on the above-mentioned question of identity, these experts must particularly engage themselves to keep the secret, unless they are regularly sworn in for the performance of such duties.

SEC. 20. If, in the cases mentioned in section 18, it is contended that a patent is altogether null and void, so that, according to section 10, it would have to be canceled, if the reasons for which it is impugned should prove to be founded on truth, a report has to be made to the home minister, and the decision of the same to be awaited, even if no express proposal has been made that the patent should be canceled.

SEC. 21. The costs arising in matters connected with the granting and prolongation of patents of invention have to be paid down, at the office of the home ministry, at the rate fixed by the order in council of January 26, 1866. As for the rest, the same principles and regulations concerning the payment of fees have to observed in matters connected with patents as those which are observed in other matters belonging to the sphere of action of the administrative authorities.

SEC. 22. All patents of invention which will hence-forward be granted in our name by the home minister, in accordance with the full powers hereby once for all conferred upon him, have to be judged by the contents of the present order in council. From the moment that the patentee receives his patent he has to submit to all the clauses of the present order in council, which are, in fact, to be considered as the conditions on which the patent has been granted to him.

To which all those whom it may concern will have to conform.

INCLOSURE 2.

Order in council of January 26, 1866, *concerning the fees to be paid for the granting and prolongation of patents.*

The following fees have to be paid for the granting and prolongation of patents:

1. Every person applying for a patent has to pay—

For the opinion to be given by experts on his invention, 5 thalers..... $3 65
Accessory fees, levied at the office of the home ministry, for the copying of documents, &c., 2½ thalers..... 1 82
Total, 7½ thalers..... 5 47

This sum must be paid on the very day on which the application for the patent is presented.

2. When the patent applied for is granted to the applicant for five years, he has to pay—
Stamp duty, 5 thalers..... $3 65
Price of the patent itself, 15 thalers..... 10 95
Total, 20 thalers..... 14 60

3. On applying for a prolongation of the time allowed to him for the carrying out of his invention the patentee has to pay—
Stamp duty, 1 thaler..... $0 73
Accessory fees, levied at the office of the home ministry, for the copying of documents, &c., 3 thalers..... 2 19
Total, 4 thalers..... 2 92

4. On applying for the prolongation of his patent for another period of five years the patentee has to pay—
Stamp duty, 5 thalers..... $3 65
Accessory fees, levied at the office of the home ministry, for the copying of documents, &c., 2½ thalers..... 1 82½
Price of the prolongation of patent, 42½ thalers..... 31 02½
Total, 50 thalers..... 36 50

Concerning the fees to be levied for intermediate enactments caused by any flaw which may be found in the documents presented to the home ministry, as well as in the cases mentioned in sections 9 and 13 of the order in council of January 20, 1853, the general regulations referring to this subject have to be observed.

As for the rest, all documents presented to the home office in matters connected with the granting or prolongation of patents have to be written on stamped paper, of which all those whom it may concern are specially reminded, many contraventions having of late taken place against this clause.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

L. C. CHASE *vs.* EDWARD WESSON *et al.*

[*In Equity.—Before Shepley, Circuit Judge.—Decided October 18, 1873.*]

The complainant having been long in the enjoyment of his patent, a preliminary injunction was ordered restraining the defendants from infringing it, notwithstanding affidavits were filed showing that articles embodying the alleged invention had been in use before the complainant made it, there being evidence to the contrary, and none of the articles being produced.

[*George E. Burton*, for complainant.
George L. Roberts, for defendants.]

SHEPLEY, *J.*:

Limiting the first claim in this patent to that only which was invented by the patentee—*i. e.*, his device, as described in his specification, of such a mode of attaching a halter dee or other harness-ring to a halter or harness-strap by means of rivets, in the described mode, passing through holes in the described flanges of the dee or ring without the necessity of sewing, and dispensing with the use of any other material to form the "lap," in the mode and for the purpose described—the patent is for a different invention from that described in the patent to Samuel C. Hawkins, No. 21,674, granted October 5, 1858, which is relied upon to prove want of novelty in complainant's invention.

No exhibit is produced of any such harness-ring with two flanges as some of the affiants on the part of respondents testify were in use before the date of the complainant's invention. The affidavits introduced by the complainant throw very grave doubt upon the question of the existence of any such devices at the dates indicated. These doubts are greatly confirmed by the omission to produce as exhibits in the case any such harness-rings as the witnesses describe, which could easily have been produced if they had existed and been in use for so long a time. It is not, therefore, at this stage of the case, necessary to decide what effect they would have upon the plaintiff's patent if the court were satisfied of their prior use.

As the plaintiff has been long in the enjoyment of his rights under the patent, and there is no doubt upon the question of infringement, the injunction will issue as prayed for in the bill, until the further order of the court.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,590.—Defecating and Clarifying Cane-Juice.—Granted to RICHARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 3, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,339.—Water-Wheels.—Granted to JAMES P. COLLINS, December 6, 1859; reissued June 12, 1860, and May 13, 1873. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,491.—Mode of Applying Sulphurous-Acid Gas in the Defecation of Saccharine Liquids.—Granted to NANCY POINDEXTER BRASHEAR, executrix of ROBERT B. BRASHEAR, deceased, December 6, 1859, and reissued October 22, 1860. Application filed September 4, 1873. Testimony closes November 4, 1873. Hearing November 19, 1873.

26,408.—Composition for Kindling Fire.—Granted to ELIZABETH BELLINGER, December 13, 1859, and reissued August 7, 1866. Application filed September 15, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,416.—Seed-Planters.—Granted to WILLIAM BLEMING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,434.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, Jr., December 13, 1859, and reissued April 3, 1860. Application filed September 13, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,475.—Breech-Loading Fire-Arms.—Granted to ESTHEL DUNTON, December 20, 1859, and reissued December 11, 1860. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 12, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,486.—Pipe-Molding.—Granted to JOHN FISHER and JOHN INGHAM, December 20, 1859, and reissued April 26, 1860. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,487.—Screw-Taps.—Granted to WILLIAM and ROBERT FOSTER, December 20, 1859. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Trap.—Granted to JAMES A. LOWE, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,513.—Nail-Plate Feeder.—Granted to JOHN NEWELL, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KIMBALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

6,589.—Harvesters.—Granted to JOHN GOSS, December 27, 1859, and reissued January 15, 1861. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to JONATHAN P. GROSVENOR, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to SAMUEL LEEDS, December 27, 1859. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Persons Ware.—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, December 27, 1859. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to BENJAMIN F. STUBTEVANT, December 27, 1859. Application filed September 25, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,674.—Clothes-Driers.—Granted to B. B. HAWES, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to FRANCIS C. LOWTHROP, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,808.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 10, 1860. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,823.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,880.—Machines for the Manufacture of Tinware, granted to SAMUEL J. OLMSTED, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,906.—Stitches.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROSSER O. MELDRUM and AMOS B. PARSON, January 24, 1860. Application filed October 28, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860, and reissued August 1, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,942.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,950.—Lamps, granted to GEORGE NEILSON, January 24, 1860. Application filed October 16, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOMINSKY, January 31, 1860, and reissued March 26, 1867. Application filed October 20, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,022.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTLER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,043.—Lock for Umbrella-Stands.—Granted to ALFRED M. FOOTE, February 7, 1860. Application filed November 3, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,135.—Soldering-Irons.—Granted to ANSEL BURBANK, February 4, 1860. Application filed November 3, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 28, 1860; and reissued August 4, 1868. Application filed October 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,436.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOVE, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

30,467.—Apparatus for Singeing Pigs.—Granted to ABRAHAM and EDWARD M. DENNY, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,962.—Pare-Bones.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

DISCLAIMERS FILED.

24,484.—Improvement in Apparatus for the Manufacture of Paper-Pulp.—Granted to JOSEPH B. PALMER and GARDNER HOWLAND, June 21, 1859; reissue No. 998, dated July 3, 1860; reissue No. 2,731, dated August 13, 1867. Disclaimer filed June 20, 1873. Disclaims:

"That part of the claim in said specification which is in the following words, to wit: '2. The employment of the perforated diaphragm *g g*, when arranged substantially as described, to protect the pipes *h h*, and to strain the liquid from the stock, as and for the purpose above described.'"

94,434.—Improvement in Apparatus for the Manufacture of Paper-Pulp.—Granted to JOSEPH B. PALMER and GARDNER HOWLAND, June 21, 1859; reissue No. 996, dated July 3, 1860; reissue No. 2,730, dated August 13, 1867. Disclaimer filed June 20, 1873. Disclaims:

"That part of the claim in said specification which is in the following words, to wit: '1. The employment of two boilers in the reduction of paper-stock, so arranged in respect to each other that the steam-heat remaining in one, after the boiling process has been completed, may be transferred to the other boiler in which the boiling process is being commenced, in combination with the pipes or other means by which such steam-heat is thus transferred, substantially in the manner and for the purpose above described,

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date November 4, 1873.]

6,970.—Carpet.—JOHN BROWN ALDEN, Worcester, Mass. Application filed October 1, 1873. Term of patent 7 years.

6,971.—Gas-Burner.—EDGAR R. BEACH, Philadelphia, Pa. Application filed October 21, 1873. Term of patent 3½ years.

6,972.—Stove.—RICHARD A. CULTER and DAVID C. PROCTOR, Peoria, Ill. Application filed August 19, 1873. Term of patent 14 years.

6,973.—Bracket.—OTTO F. FOGELSTRAND, Kensington, Conn., assignor to HART, BLIVEN & MEAD MANUFACTURING COMPANY, same place. Application filed June 30, 1873. Term of patent 7 years.

6,974.—Match-Safe.—WALTER A. HAYNES, Everett, assignor to himself and STEPHEN BADGER, Charlestown, Mass. Application filed October 1, 1873. Term of patent 7 years.

6,975.—Goblets, &c.—JAMES HOBBS, Bellaire, Ohio, assignor to himself and BELMONT GLASS-WORKS, same place. Application filed October 4, 1873. Term of patent 3½ years.

6,976.—Goblets, &c.—JAMES HOBBS, Bellaire, Ohio, assignor to himself and BELMONT GLASS-WORKS, same place. Application filed October 6, 1873. Term of patent 3½ years.

6,977.—Stove.—HENRY S. HUBBELL and ALFRED S. HUBBELL, Buffalo, N. Y. Application filed October 10, 1873. Term of patent 7 years.

6,978.—Stove.—HENRY S. HUBBELL and ALFRED S. HUBBELL, Buffalo, N. Y. Application filed October 10, 1873. Term of patent 7 years.

6,979.—Heating-Stoves.—JOHN MAGEE, Chelsea, Mass., assignor to THE MAGEE FURNACE COMPANY. Application filed July 29, 1873. Term of patent 7 years.

6,980.—Floor Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, Philadelphia, Pa. Application filed October 13, 1873. Term of patent 3½ years.

6,981.—Floor Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, Philadelphia, Pa. Application filed October 13, 1873. Term of patent 3½ years.

6,982.—Paper-Boxes.—EDWARD C. MOORE, Yonkers, N. Y., assignor to TIFFANY & Co., New York, N. Y. Application filed August 4, 1873. Term of patent 7 years.

6,983.—Glass Bottles.—JOSEPH W. PHILBROOK, West Roxbury, Mass. Application filed October 24, 1873. Term of patent 14 years.

6,984.—Carpet.—CHARLES A. RIGHTER, Philadelphia, Pa., assignor to DORMAN, MAYER & Co., same place. Application filed October 21, 1873. Term of patent 3½ years.

6,985.—Bottles.—NEHEMIAH SLEEPER, Burlington, N. J., assignor to SLEEPER, WELLS, and ALDRICH, same place. Application filed September 11, 1873. Term of patent 7 years.

6,986.—Overshoes.—GEORGE WATKINSON, New Haven, Conn., assignor to L. CANDEE & Co., same place. Application filed June 27, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date November 4, 1873.]

1,516.—Ladies' and Children's Shoes.—KENNY & MCPARTLAND, New York, N. Y. Application filed October 30, 1873.

"two medallions, one overlapping the other, bearing the firm name and address, 'Kenny & McPartland, New York,' disposed upon both."

1,517.—Whisky.—LIVINGSTON & Co., San Francisco, Cal. Application filed October 25, 1873.

"the words 'Pride of Kentucky,' and the letters 'S. L. F.,' of which the middle letter, L, is surrounded by a square, arranged in diamond shape around the same."

1,518.—Stoves.—THE UNION STOVE AND MANUFACTURING COMPANY, Pittston, Pa. Application filed September 27, 1873.

"'Pittston Cook.'"

1,519.—Knit Scarfs or Tippets.—JOHN W. TUTTLE, Watertown, Mass. Application filed October 31, 1873.

"'VEILNUBIA.'"

1,520.—Refined Petroleum.—C. WEST & SONS, Baltimore, Md. Application filed October 21, 1873.

"the figure of a Maltese cross with the letters A. S. O, printed across the face of it."

1,521.—Toy Wheels.—SAMUEL T. WHEELWRIGHT and CHARLES L. LOCKE, Buffalo, N. Y. Application filed September 27, 1873.

"the figure of a star, with the words 'Wheelwright and Locke, Manufacturers, Buffalo, N. Y.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date November 4, 1873.]

ORIGINAL PATENTS.

144,179.—Harvester.—HENRY A. ADAMS, Sandwich, Ill. Application filed May 13, 1873.

The driving-wheel is loose on its axle, which is vertically adjustable by means of a rack and pinion. It is held at the proper height by a pawl engaging with the rack.

Claim.—The traction-wheel A, hub *a*, collars D carrying dogs *d*, pinions C, and cogged segments E, in combination substantially as specified.

144,180.—Grain Separator and Scourer.—SAMUEL W. ANDREWS and LEWIS GODFREY, Greenville, assignors of one-half their right to O. G. VANDERHOOF, Knoxville, Tenn. Application filed September 19, 1873.

The grain first passes through a screen; then it enters a blast-separator, whence it is directed to a cockle-separator and scourer, or it may pass immediately to the scourer, and thence through a second blast-separator to the place of final discharge. Automatic valves control the force of the blast.

Claim.—1. The horizontal scouring-cylinder *p*, having scourers *o*, constructed with longitudinal rasping ridges and arranged eccentrically, as described, in combination with the peculiarly-perforated scouring-case *q*, as specified, for the purpose set forth.

2. The suction-fan F, central wind-chamber H, and wind-trunks $T T^2 T^3$, arranged and operating as described, in combination with the blast-separators B E, dust-chambers U, screenings-chamber G, and grading-chamber V, for the purposes shown.

3. The combination and arrangement, in the blast-separator B, of the intersecting vertical and inclined grain-discharge and blast orifices $v v^2$ and the passage *u*, into the wind-trunk formed on a line equidistant between the outer ends of the two orifices and equal in capacity to both, as described, for the purposes stated.

4. The enlargement *u'*, in the blast-separator B, and the second set of orifices and passages beneath the same, substantially as and for the purpose specified.

5. The combined arrangement, in a grain-cleaner, of a preliminary blast-separator, B, a cockle-separator, C, receiving the grain and cockle from the former, and a scourer, D, receiving the grain from the cockle-separator, substantially as herein described.

6. The cut-off *t*, arranged as described, in combination with the hoppers $s^2 s^3$, for conducting the grain from the blast-separator B through the cockle-separator C or directly to the scourer D, as set forth.

7. The automatic governor or blast-equalizer consisting of the valve L within the wind-chamber H, the valve-pivot *e* with external arm e^2 and adjustable weight e^3 thereon, and the piston J K within a cylinder, I, in combination with the gage-aperture *d*, arranged and operating substantially as specified.

8. The automatic door or valve M in the bottom of the wind-chamber H, constructed and arranged to be held closed by the force of the blast and to open under the weight of accumulations in the chamber, in combination with the drawer N beneath the same in the dust-chamber U, by which the heavy particles which settle in both chambers may be taken from the machine, as set forth.

9. The combination and arrangement of the parallel shafts S S^2 S^3 and pulleys P P^2 P^3 P^4 P^5, for driving the several parts of the apparatus in unison by simple band-and-pulley connections, as described.

10. The combination, in a grain-cleaner, of a screening-shoe, A, a preliminary blast-separator, B, a cockle-separator, C, a scourer and polisher, D, and a final blast separator or grader, E, arranged and operating substantially as herein described, for the purposes set forth.

144,181.—Scroll-Saw.—JOSEPH ATKINSON, Burlington, N. J. Application filed March 15, 1873.

The saw is secured between the ends of two vibrating arms, and then strained by the action of a cam.

Claim.—Holding and adjusting the saw-blade G by aid of the pin *c*, arms *d d*, slide *e*, plates *f f*, eccentric *g*, lever or arm A, pin *i*, fastener H, screw or rivet *l*, and set-screw *m*, in combination with the arms E E', substantially as and for the purpose set forth.

144,182.—Artificial Crowns for Teeth.—JOHN B. BEERS, San Francisco, Cal. Application filed September 27, 1873.

A hollow crown of gold is lined with enamel, and secured by cement over a screw inserted in the natural tooth.

Claim.—1. The hollow metal crown or shell A, for the purpose above described.

2. The hollow metal crown or shell A, when filled with a porcelain enamel or other substance, substantially as and for the purpose above described.

3. A shell or hollow crown secured upon and around the projecting portion or neck of a tooth by means of the screw *c* and a suitable cement, substantially as above described.

144,183.—Railroad-Car Heater.—BARTHOLOMEW BERGHAUSEN and AUGUST LOUIS KIESLING, Cologne, Germany. Application filed January 11, 1873.

The portable fuel-tray or fire-chamber is generally placed under the car-seat. It is adapted to burn a peculiar fuel, which evolves but little smoke or flame. The air-draft comes through a depending open-mouthed hood. The exit-draft pipe passes down through the car-bottom. The seat-front has a guard to protect the clothing of the passengers.

Claim.—The tubes *a* and *b*, fuel-tray *c*, tube *d* provided with adjustable mouths *e*, and tube *f* provided with a suction apparatus, *g*, all combined and operating together, as described.

144,184.—Furnace for Reducing Ores Containing Precious Metals.—JAMES H. BOYD, Chicago, Ill.—Case A. Application filed October 14, 1873.

The pulverized ore is fed into the right hand or upper cylinder, where it is heated and agitated in contact with air, but out of contact with the flame or products of combustion. As it passes through this cylinder it gradually approaches a greater heat, and is almost completely desulphurized, the metal in the form of oxides falling into the second revolving cylinder, where it is exposed to the direct action of flame from the reducing-hearth, being tumbled about by the revolving ribbed cylinder as before. Fluxes are here added to free the lead and permit it to carry down the precious metals. The mass, at a high heat, is delivered to the reducing-hearth, the metals and heavier slags arranging themselves according to gravity in the several hearths. The matt is subjected to liquid lead in the hearth near the grate, and tapped thence into the overflow-pot.

Claim.—1. The combination and arrangement, substantially as shown and described, of the inclined revolving ribbed cylinders C D and reducing-chamber B, constructed and operating in the manner essentially as described.

2. The reducing-chamber B, provided with the hearths *b b' b''*, bridges *c c' c''*, and ducts *b*, substantially as specified.

3. The combination and arrangement of the fire-grate A, reducing-chamber B *b b' b''*, cylinder C, and cylinder D, all inclosed by the furnace-walls, substantially as specified.

4. The combination of the cylinder C, friction-rollers *o o*, cogged rim T, cog-wheel S, shaft *q*, spider *r*, cylinder D, worm P, shaft *p*, and screw Q, substantially as specified.

5. The arrangement and combination of the ingress *k*, air-space K, arches *m m'*, compartment J, air-space M, and grate A, with the reducing-chamber B, cylinders C and D, and compartment J', for the purpose of warming the air to supply the grate, substantially as specified.

6. The combination and arrangement, with relation to the cylinders C D and reducing-chamber B, of the funnel-pipes E E' E'', for feeding in at various points the pulverized ore and fluxes and reducing agents during the operation of the furnace, substantially as specified.

7. The combination of the reducing-chamber B, divided into the hearths *b b' b''* at different levels, the ducts *d*, conduct or pipe *e*, and overflow-pot W, whereby the height and flow of the metals in the reducing-chamber may be regulated, substantially as specified.

144,185.—Apparatus for Feeding Fuel to Ore-Reducing Furnaces.—JAMES H. BOYD, Chicago, Ill.—Case B. Application filed October 14, 1873.

Above the grate and reducing-chamber is an inclined feed-way, heated by the waste heat arising from the furnace, terminating in a small coking-chamber on a level with the grate, and guarded by a trap-valve. A rocker-arm, suspended before the fire and fitted with curved fingers, is actuated by mechanism so as to swing toward the fire with a sudden drop motion at intervals, by which means the coal crowding down is scattered over the fire.

Claim.—1. The combination and arrangement of the hot-air chamber D above the grate A, and reducing-chamber B, the inclined E, coking-chamber G, and a mechanism for casting the fuel from the chamber G upon the grate, substantially as specified.

2. The combination of the curved fingers K, shaft *k*, crank-piece *m*, bar *n o*, and cam M, substantially as specified.

3. The combination of the curved fingers K, trap H, chamber G, inclined way E, and mechanism M *o n m k i*, substantially as specified.

144,186.—Furnace for Reducing the Ores and Extracting the Precious Metals.—JAMES H. BOYD, Chicago, Ill.—Case C. Application filed October 14, 1873.

The overflow-pot is made with outlets which may be bridged or heightened by a sliding gate, so as to regulate the feed from the reducing-hearth and direct the liquid matt into either a cupelling-furnace on one side or a warming or waste pot upon the other, as may be desired.

Claim.—1. The combination and arrangement of the reducing-furnace A B O D and the cupelling-furnace E D' with the overflow-pot G, the exit-flue J from the cupelling-furnace being located to open into the reducing-chamber, and with or without the warm-air pipe J', arranged to draw the air-supply for the grate of the cupelling-furnace from an air-space, A', warmed by the waste heat of the reducing-furnace, whereby the bullion may pass, while still hot, from one furnace to the other, and the waste heat of both furnaces may be utilized, substantially as specified.

2. The overflow-pot G, fitted with the slides *i i* and ways or spouts *g g*, in combination with the reducing-furnace, cupelling-furnace, and receiving-pot F, substantially as specified.

3. The combination and arrangement of the two inclined feed-ways H H', provided with the division-ridge A, with the grates D D', substantially as and for the purpose specified.

4. The combination and arrangement of the reducing-furnace and cupelling-furnace, conjoined and arranged substantially as specified, that the bullion may be drawn, while still hot, from the reducing-chamber directly into the cupelling-furnace, to save re-heating the bullion for cupellation.

144,187.—Machine for Cutting the Heads of Fence-Pickets.—ANDREW BURNHAM, Revere, Mass. Application filed May 24, 1873.

A cutter is adjustably attached to a vibrating lever secured to a bed, upon which the picket to be pointed is placed. A movement of the lever forms one side of the point, when the picket is reversed and the other side cut in a similar manner.

Claim.—1. The bed *a*, lever *b*, and holder *d*, when constructed, combined, and arranged to operate substantially in the manner described and shown.

2. The cutter-holder *d*, having stop *n*, and formed to receive lever *b*, and with cap *p*, provided with parallel grooves to receive the cutter *c*, substantially as described and shown.

144,188.—Car-Replacer.—JOHN G. BURKHARDT, Brooklyn, N. Y. Application filed October 8, 1873.

A longitudinal groove on the under side of the replacer permits of its being placed over the rail. The wheel is guided to one side or the other, as required, by the pivoted tongue in the front end of the replacer.

Claim.—The portable shoe or frog A, herein described, having a longitudinal groove, J, on the under side, and grooves D, D', F, and G on its upper surface, in combination with a pivoted tongue, C, substantially as and for the purpose set forth.

144,189.—Harvester.—STEPHEN D. CARPENTER, Madison, Wis. Application filed September 5, 1873.

The rake is connected to the outer rear corner of the platform by a series of jointed arms, and is guided, by slots and grooves in the platform, by means of rollers attached to the rake. A binder's box and table are supported upon the frame at the rear inner corner.

Claim.—1. The slot I and groove *o*, arranged in relation to each other, substantially as described, for the purpose of guiding and directing the movements of the rake D, as set forth.

2. The rake D, in combination with the rod *c*, said rod having one end hinged to the rake, with its opposite end hinged to the side of the machine, at or near its rear end, and provided with a series of intermediate joints, independent of the joint-rod *b*, and arranged to operate as described, to assist in guiding and controlling the rake in its movements, as set forth.

3. In combination with the rake D, having the pointed rod *c* hinged to its rear end, the finger-piece R hinged to the rake at its front end, and attached rigidly to the joint-rod *b*, the said parts being constructed and arranged to operate substantially as described.

4. The box *e*, with its binding board P arranged at the corner of the platform and at right angles to the rake during its backward movement, for the purpose of enabling the binder to receive the bundle from the rake in a compact form, as herein set forth.

144,190.—Breech-Loading Fire-Arm.—HORACE A. CASTLE, Ilion, N. Y. Application filed August 26, 1873.

Claim.—1. The spring thumb-lever B, pivoted to the top of the stock at *a*, extended forward of the recoil-shield A', and terminated in the locking-tongue *b*, which enters the recess *d*, in combination with barrels hinged at *c* to the frame of the arm, and with the curved or segmental-shaped socketed piece G, and the slotted pivoted pin J, the piece G being attached to the barrels and passed through a curved slot, *g*, and the pin to the thumb-lever B, and passed through the recoil-plate A' into the socket *g'*, all substantially as herein described, and for the purpose set forth.

2. The U-shaped spring-extractor S with hooked ends *r*, constructed to take hold of two cartridges at the same time, and adapted to be inserted through the breech and held in place, substantially in the manner described.

3. The combination of the U-shaped spring-extractor S *r*, passed through the recoil-plate A', pin J, and strap *s*, the pin J serving to prevent the extractor moving too far forward when the barrels are thrown down on their hinge, and the strap preventing it moving too far back when the barrels are thrown up against the breech or recoil-plate, substantially as described.

144,191.—Spinning and Twisting Machine.—HENRY A. CRAPIN, Bridgeport, Conn. Application filed July 25, 1873.

The device which draws and twists the yarn is placed in an oil cup or reservoir, and provided with devices which keep up a circulation of oil to lubricate the moving parts, but prevent it reaching the yarn. There is also a compact arrangement of the parts making up the whole machine.

Claim.—1. A drawing and twisting device combined with an oil-reservoir, and having oil-reboptacles and discharge-passages in and through revolving pulleys E' E, and in which the long hollow tube of said pulleys are arranged relatively to each other and to the upright hollow shaft, which carries on its upper end the drawing-pulley a, as described.

2. The combination of the specified drawing and twisting device with an oil-reservoir having attached to it the stationary tube s, which passes up through the moving parts and protects the yarn from being soiled by the oil as it passes through on its way to the ring and traveler, substantially as described.

3. The combination of the drawing and twisting device, ring and traveler, building device, and spindle, substantially as described, and for the purpose set forth.

144,192.—Stove-Pipe Damper.—EDWIN C. CHAPMAN, Lacon, assignor of one-half his right to JAMES M. HORTON, Chicago, Ill. Application filed September 5, 1873.

The arms E are retained in position between the ribs upon the button and upon the damper-plate, by their contact with that portion of the stove-pipe through which they pass and upon which they rest.

Claim.—The damper B, provided with the spindle C and with the ribs a a, in combination with the button D and the arms E, substantially as and for the purposes specified.

144,193.—Carriage-Cover.—EDSON H. ELLIOTT, Charlestown, Mass. Application filed April 30, 1873.

The arrangement of cords and pulleys, referred to in the claim, is for raising and lowering the tent which shelters the carriage.

Claim.—The ball d, the collapsing-tackle consisting of lines f g and pulleys e h, and the supporting and lifting tackle consisting of the lines r l m and pulleys n o p q, all arranged and operating substantially as shown, and for the purpose described.

144,194.—Tobacco-Drying House.—EZEKIUS W. ELLSWORTH, South Windsor, Conn. Application filed June 28, 1873.

The air enters the drying-house through openings around its base, and is deflected upward by the partitions which pass through its center and at right angles to each other, in order to utilize the wind from any quarter. The partitions do not extend to the roof, but the upper part of the house is unobstructed, for the free horizontal circulation of air.

Claim.—A tobacco-shed or drying-house which is divided into four compartments by the longitudinal and transverse partitions, as above described, and which is open or in one compartment above the partitions, to allow a free and uninterrupted circulation of air in the roof, as set forth.

144,195.—Car-Wheel.—GORDON ELMSLIE, Toronto, Canada. Application filed March 27, 1873.

A single curved plate wheel, one side plain, the other side having large curved ribs extending from the hub to the flange; also smaller ribs extending from the flange part way to the hub.

Claim.—A car-wheel having the outer surface of the web A plain, large curved ribs B extending from the rim C to the hub D, and small curved ribs E, arranged and formed substantially as and for the purpose specified.

144,196.—Consecutive-Number Printer.—ROBERT M. EVANS, Buffalo, N. Y. Application filed May 17, 1873.

A case is provided with several numbering-wheels made type-high, which are moved so as to present consecutive numbers by means of levers and a pawl and ratchet, the levers being operated by coming in contact with the platen of the press when the impression is made.

Claim.—In combination with the type-wheels of a consecutive-numbering apparatus, the pivoted lever L, lever J, with its lugs M, spring O, pawl H, and ratchet-wheel J', all constructed and arranged for operation substantially as and for the purpose described.

144,197.—Glove-Fastener.—LUCIUS FARRIS, San Francisco, Cal. Application filed July 26, 1873.

Claim.—A glove-fastener consisting of the buckles b b and hinged self-adjusting plates C, one having the projecting eye f, when united by the chain d, substantially as and for the purpose described.

144,198.—Pastern-Halter for Stitching Horses.—JOHN C. FORD, Montreal, Canada, assignor of one-half his right to AUSTIN D. CABLE. Application filed September 4, 1873.

A strap or collar to be secured around the pastern-joint of the fore foot, and having an additional strap extending upward and secured to the harness or shaft.

Claim.—As a new article of manufacture, a pastern-halter, to be applied as described, the same consisting of the combination of the ring B and halter A B, constructed in the manner specified, for the purpose set forth.

144,199.—Planing-Machine.—LUMAN GOULD, Norwich, Conn. Application filed May 9, 1873.

The pressure-bar is made removable horizontally to reach the cutter-head.

Claim.—The combination, with the pressure-bar or plate N and its standards N' N'', of the slotted flange 10, stationary flange 12, slotted pieces O and P, and fastening screws or bolts 15 and 17, substantially as and for the purposes set forth.

144,200.—Lantern.—EDGAR K. HAYNES, Boston, Mass. Application filed October 9, 1873.

An improvement upon patent 136,004. The air-deflecting plate is provided with a series of holes to permit the passage of water. To counteract the effect of currents of air passing through these holes, a second dished plate is located above the first.

Claim.—1. The annular dished plate g, provided with a central hole, g^1, for the passage of the burner therethrough, and holes g^2, arranged, constructed, and operating substantially as shown and described.

2. The combination of a curved dished plate, f, and an annular plate, g, substantially as and for the purposes shown and specified.

3. In a lantern such as described, the annular plate g, annular deflector A, and perforations a^2 arranged in relation to a plate, f, and the wick-tube, substantially as set forth.

144,201.—Volute Spring.—PERRY G. GARDINER, New York, N. Y. Application filed October 13, 1873.

The plate is formed with longitudinal grooves or channels upon its face, which are largest toward the butt, and then gradually taper and fall away toward the opposite end of the plate, where at last they flatten out and leave the face of the plate flat and smooth a sufficient distance to form a part of the smaller or innermost coil of the spring.

Claim.—1. A spiral volute spring constructed from a plate having a gradual taper or thinning from near one end toward the other end, and with the grooves upon one face of the plate gradually diminishing from end to end, substantially in the manner described.

2. The tapering plate and grooves, as described, having the smooth and gradually-thinning end b of the butt, and the smooth face c at the opposite end of the plate, beyond the grooves, substantially in the manner and for the purposes set forth.

144,202.—Scraper.—SOLOMON HORNEY, Richmond, Ind. Application filed August 4, 1873.

The draw-bar is attached by means of a rod passing through the ribs in the back of the scraper, which turns on the rod and is held in position for scraping by means of a notched bar which engages the upper edge of the scraper. The handles are pivoted to the rear of the scraper, and are also connected with it by adjustable straps, which allow the position of the scraper to be changed so that it can be used as a scoop. When the scraper is reversed to discharge its load it rides along the ground on spring-runners.

Claim.—1. The spring-runners H, attached to the scraper for the purpose of holding the same off the ground while discharging its load, substantially as described.

2. The beam A, having the draw-bars B B attached, said bars being pivoted to the ribs M by means of the rod N, or its equivalent, the scraper revolving upon said rod, substantially as described.

3. The handles C, attached to the ribs M, in the manner shown, in combination with the straps I for adjustment, whereby the scraper may be placed in position to operate as a scoop, substantially as described.

144,203.—Condensing Apparatus for Marine Steam-Engines.—JOHN HOUPT, Springtown, Pa. Application filed August 2, 1873.

The jet-condenser is combined with a refrigerator for condensing the exhaust steam, and a hot-reservoir with a priming-reservoir to fill the former, a hot-well, and the pump, so as to use the water as fresh as possible by continually using the condensed exhaust steam. With these are combined two dividing-valves, one above the other, and connected to the jet-condenser for the purpose of saving all the fresh water and using it over again.

Claim.—1. The combination, with a jet-condenser, A, of the refrigerator B, the reservoirs F and f', the hot-well D, and the pump E, the said parts being constructed and arranged together substantially as and for the purpose hereinbefore set forth and described.

2. The dividing-valve chamber G, with its dividing-valves g' and g'', in combination with the jet-condenser A, refrigerator B, hot-well D, surface condenser I, expander and cooler K, surface condenser L, save-all condenser M, air-pump H, the governor-valve 10, the self-closing valve i', and the check-valves g^4 g^5 in the pipe Q, the said parts being arranged to operate together substantially as set forth, for the purpose of saving all the fresh water of condensation, for using over and over again in the jet-condenser A and the steam-generator of a marine-engine, as described.

144,204.—Governor for Steam-Engines.—JOHN E. HUGOU, Richmond, Ind. Application filed August 18, 1873.

Claim.—The combination of the cylindrical valve H, having the slot K, cross-head M, and threaded valve-stem P, with the cylindrical case B, provided with pin I, and chamber B, all constructed substantially as and for the purpose set forth.

144,205.—Governor.—JOHN E. HUGOU, Richmond, Ind. Application filed October 17, 1873.

The cylindrical chamber in which the valve operates is made in a separate piece and provided with ports. The arms of the rotary valves are arranged with packing-plates in order to secure, by the pressure of the steam, a perfectly tight joint.

Claim.—The combination of the cylindrical valve-seat C, placed in the chamber B, the valve K, having the arms H, and packing-plates E, with the ports G, all arranged and operating substantially as described.

144,206.—Machine for Slicing Dried Beef.—ANTHONY IAKE, Lancaster, Pa. Application filed September 8, 1873.

A platform having vertical posts has a sliding frame, which has a knife placed in an oblique position, and is adjusted by thumb-screws and slotted wedges.

Claim.—1. The oblique knife E, arranged in a vertically-sliding frame, D, and made adjustable by means of a movable piece, G, in combination with the grooved guides A' A', frame A, holding-bed B' C, and base B with its ledge P, the whole substantially as and for the purpose shown and specified.

2. In combination with a knife, E, and frame D, the adjusting piece G, with its attached plate L, screw-bolts and thumb-screws K, and slotted wedges I J, substantially arranged in the manner and for the purpose shown and set forth.

144,207.—Railway-Switch.—GEORGE KERCH, Centreville, Mich. Application filed August 11, 1873.

The rails are held by the stud D on the sleeper and the projection a on the bar E. The bar is provided on its lower side with a curved projection, c, which rests in the channel H in the sleeper between the ears F, and the bar and sleeper are secured together by a bolt passing through holes in the ears and a groove on the upper side of the bar.

Claim.—1. The combination of the bar E, having the groove b, with the bolt d and ears F, substantially as shown and described.

2. The sleeper A, provided with the channel H, to receive the arch e of the bar E, substantially as specified.

3. The combination of the bar E, constructed with the arch e, groove b, and projections a, with the sleeper A, provided with the channel H, ears F, bolt d, and stud D, substantially as specified.

144,208.—Faucet.—ASHEL D. KING, Granville Corners, Mass., and JUSTUS W. KING, Bridgeport, Conn. Application filed April 21, 1873.

A slide is pivoted, by means of a screw, to the bushing, and, as it closes, is held firmly against said bushing by a spring, the whole operating to exclude foreign substances.

Claim.—The combination of the pivoted cover c, screw, and spring e with the receiver B, as described.

144,209.—Saw-Gage.—GEORGE W. KIRBY, Detroit, Mich. Application filed June 24, 1873.

Two bars are adjustably secured upon opposite sides and parallel with the cutting-edge of the saw, and are designed to limit the depth of the cut.

Claim.—The arrangement of the bars D, constructed with the threaded end E and dovetailed grooves F, cross-bar C, and nut e, substantially as shown and described.

144,210.—Bolt for Prison-Doors.—THOMAS LAIOR, Toronto, Canada, assignor to EDWARD CROSSMAN, same place. Application filed September 1, 1873.

A rotating shaft carrying projecting lugs passes along just over the top of the cell-door. By rotating this shaft, through bell-cranks or racks and pinions, the keeper may, in his own room, lock every cell-door in the prison. This fastening is added to the usual locks and bolts.

Claim.—The dogs D upon the lock-shafts A, whether operated through the rack and cog-wheels or the bell-cranks and levers, as shown, and combined to form a fastening for prison-doors, as described.

144,211.—Grain-Separater.—SAMUEL LESSIG, Sr., Reading, Pa. Application filed February 1, 1873.

The primary separating-screen, the sieve-box, and the intermediate chute are connected together and receive their vibration by means of a special arrangement of levers and links.

Claim.—The combination of the separator A with the vibrating chute C and the sieve-box D, by means of the two pairs of long jointed levers b^1 b^2, the pair of short jointed levers b^3, and connecting-links b^4 b^5, substantially in the manner and for the purpose herein set forth.

144,212.—Revolving Blackboard.—COMFORT B. LYON, Buffalo, N. Y. Application filed October 9, 1873.

Claim.—1. The combination, with a central standard and supporting-arms or their equivalent, of a series of blackboards, B, pivoted at the center of the upper and lower edges thereof, so that either end of any one of the boards can be arranged in conjunction with either end of any adjacent board, and thereby form one continuous surface, substantially as and for the purpose herein-before set forth.

2. The combination, with the pivoted boards B and supporting-arms C C', of the tie-rods d, substantially as and for the purpose hereinbefore set forth.

3. The combination, with the supporting-arms and boards C B, of the pivot-bolt g and flanged plate A, as and for the purpose hereinbefore set forth.

4. The combination, with the standard A and socketed base D, of the screw f and collar and braces f h, substantially as hereinbefore set forth.

5. The combination, with a central standard, of a series of

pivoted blackboards, B, when the lateral or abutting edges are rounded and grooved so as to look together, as herein shown and described.

144,213.—Faucet.—JOHN MCKENNA, ALEXANDER MCKENNA, and THOMAS MCKENNA, Pittsburg, Pa. Application filed August 29, 1873.

Within the hollow plug of a faucet a piston, squared in one part, is arranged to act as a wrench for turning said plug and to force a small stream of liquid through an orifice and pipe connecting with the piston-chamber, either during the passage of said liquid through the main opening in the plug or after the closure thereof. A spiral groove upon the plug connects at one end with a tube arranged in the barrel of the faucet, and at the other with an air-channel in the body of said faucet, in order to permit the admission of air during the operation of the device.

Claim.—1. The tubular key A, having therein a transverse partition, s, arranged beneath the axial line of the shank B, in combination with a plunger, K, operating entirely above said partition, and with the openings w and P, and the small pipe d, as and for the purposes set forth.

2. A tubular key, A, having fitted therein a plunger, K, in combination with an air-vent, S, extending through the shank B, and down around the outside of the key, and terminating or having its mouth below the piston-chamber, as and for the purposes set forth.

144,214.—Gear-Cutting Attachment to Lathes.—THOMAS O. MILLS, Rockford, assignor of one-half his right to WILLIAM H. MILLS, Freeport, Ill. Application filed June 20, 1873.

The cross-head F, in which the gear-holding mandrel L is located, is adjustable vertically by the screw G; and the frame C, that supports the cross-head and all the operating parts, is hinged to the base-plate A at point b, and may be turned over in the plane of the axis of the mandrel and fixed at any angle in said plane to the base-plate.

Claim.—1. The hollow index-mandrel I and tapering gear-mandrel L, in combination with the sliding cross-head F, substantially as and for the purposes described.

2. The bent arm M, secured to and moving with the cross-head F, in combination with the index-plate J and point O, substantially as described.

3. The index point or screw O, in combination with the screw or nut N, jamb-nut N', and fork m, substantially as described.

144,215.—Compound for Cleaning Metals, &c.—WILLIAM Z. MOORE, Vallejo, Cal. Application filed September 11, 1873.

Spanish whiting, aniline red, and oil of sassafras.

Claim.—The compound herein described, when employed in about the proportions given, substantially as and for the purpose described.

144,216.—Beefsteak-Tenderer.—JAMES S. MORRIS, Masterstown, Pa. Application filed August 29, 1873.

In a suitable frame are arranged two grates; to the frame is pivoted another, having a suitable lever. To the upper frame are attached a number of comb-shaped knives that pass between the grates and enter the meat placed between them.

Claim.—A series of knives, B, secured in frame F, in combination with the grates G and H, constructed and operated in the manner described, for the purposes set forth.

144,217.—Hoisting-Engine.—FRANK MURGATROYD, Cleveland, Ohio. Application filed September 4, 1873.

Small trunk-engines operate a drum-shaft having winch-heads, to which are attached adjustable cranks for operating bilge-pumps.

Claim.—The bases B B, cast with bed-plate A, the engines C C, shaft D, loose pinion F, brake-wheel G, clutch H, uprights M M supporting the drum and winch-heads, all combined and operating substantially as described.

144,218.—Shuttle-Actuating Mechanism for Looms.—JOHN R. NORFOLK, Salem, Mass. Application filed April 9, 1872.

The shuttle is moved positively by means of a reciprocating pulley, with which the shuttle-carriage is suitably connected by cords or belts. To produce the required accelerated and retarded movement of the shuttle the cams, which actuate the pulleys through the connecting levers, belt, and shaft, are irregular in form, and the pulleys are grooved both spirally and helically, like the fusee-wheel of a watch.

Claim.—The spirally and helically grooved wheel I, connected, by cord or straps, with the shuttle-moving device, in combination with the cams F, levers G, and pulley I, the whole constructed, arranged, and operating substantially as described.

144,219.—Hammock-Support.—FRANCIS PAINE, Deerfield, Mass., assignor to himself, HENRY A. AXTELL, and FREDERICK B. KEEVAN. Application filed September 5, 1873.

Two light portable rods, bent to the same arc, are hinged at their ends to admit of their opening sufficiently for a ground-support, the hammock being suspended from hooks at the hinges. A socket in the middle of each rod permits of their being folded for easy transportation.

Claim.—1. A portable hammock-frame consisting of the braces a a, hinged together at their ends, and adapted for the attach-

ment and suspension of a hammock by means of suitable hooks or rings, substantially as described.

2. The braces *a a*, hinged together at their ends, forming a frame to which to attach and suspend a hammock, and arranged with a joint at *b*, so that one part of each brace may be disconnected from the other part, substantially as set forth.

144,220.—Steering Apparatus.—MICHAEL R. PERKINS, Portsmouth, N. H. Application filed October 9, 1873.

The tiller has a sleeve sliding upon it, which sleeve has a downwardly-projecting arm provided with a roller upon its end, which travels in a groove transversely across the deck. The tiller ropes are connected at their ends by swiveled links to the sleeve and pass through pulley-blocks to the barrel of the steering-wheel. By this means the leverage is least when the tiller is amidships and increases in proportion as the tiller is moved to starboard or port.

Claim.—1. The sleeve H, sliding on the after end of the tiller, and having the arm A^1 and roller A^2, engaging with the groove J, substantially as and for the purpose described.

2. The links *l*, for connecting the blocks and tackle, in combination with the sleeve H, substantially as shown and described.

144,221.—Railway-Rail.—MICHAEL R. PERKINS, Portsmouth, N. H. Application filed May 9, 1873.

The two sections of the compound rail are separated by a paper packing, the object of which is to relieve the rail from lateral and vertical concussion.

Claim.—The section 1, having broad bearing-surface 6, in combination with section 7 and paper packing 5, extending continuously between the sections, arranged to prevent lateral as well as vertical concussion, and neutralize the action of frost, heat, and moisture, substantially as shown and described.

144,222.—Door-Check.—MICHAEL R. PERKINS, Portsmouth, N. H. Application filed October 8, 1873.

A T-headed bolt is combined with a slotted and hinged bar. When the bar is turned back against the door-post the door is securely fastened, but when it is turned out it permits the door to stand partially open. Until the door is entirely closed the fastening cannot be so manipulated as to allow the door to open sufficiently wide to admit a person.

Claim.—The bolt C, formed with the T-shaped head *c*, in combination with the slotted and hinged bar D, substantially as shown and described.

144,223.—Door-Securer.—WILLIAM H. PHIPPS, Poquonock, Conn. Application filed October 6, 1873.

A small portable device is made of metal, knuckle-shaped, with a slot in the upper side, in which a lever operates, and a spear or pointed spur, which is so pivoted to the lever that the spear is moved up and down by the swinging of the lever.

Claim.—The combination of the knuckle *a*, spear *b*, and lever *c*, all constructed and operating substantially as described.

144,224.—Railway-Switch.—HENRY H. POTTER, Sterlingville, N. Y. Application filed September 25, 1873.

The switch is operated by the action of the flange of the wheel of an approaching train, which comes in contact with the crooked levers *d* or *d'*, said levers being fulcrumed between the rails of the approaching tracks in proper chairs, which are sunk into a tie.

Claim.—The levers D *D'*, formed with the points *d d'*, pivoted in depressions in the chairs A, curved so as to pass under the rails A' B, and having their ends attached to the bar G, substantially as and for the purpose shown and described.

144,225.—Flour-Sifter.—GEORGE PURPLE, Cameron, Mo. Application filed June 9, 1873.

Claim.—The beaters *d*, when provided with coiled wires *f*, in combination with shaft *b*, crank *c*, sleeve *a'*, and cylinder *a*, as and for the purpose specified.

144,226.—Machine for Feeding Horseshoe-Nails.—SILAS S. PUTNAM, Boston, Mass. Application filed July 9, 1873.

A hopper with an inclined reciprocating bottom and a vertical moving slide. The nails are carried up against an apron, *i*, and drop between the guide-plates. A sliding bar inclines the head toward the conveyer, and a reciprocating rack underneath engages with the points and carries the nails forward. A pin, 42, on an arm, *p*, stops the nail at the end of the rack until an arm, *a'*, is brought forward and raises the pin. The nail, being clamped by said arm, is drawn forward by it; and, by means of a spring and notch in the plate, the inclined side of the nail-head is turned outward. Opposite a passage in the guide the nail is dropped, and enters a compartment in an intermittently-revolving wheel, where it is clamped, carried around, and the jaw opened, releasing the nail, and delivering it to other mechanism for finishing.

Claim.—1. In combination with the hopper E and the slide *g*, the inclined reciprocating plate *h*, operating substantially in the manner and for the purpose set forth.

2. The swinging arm A, with its plate or apron *i*, in combination with the slide *g* and the guide-plates C D, operating substantially in the manner and for the purpose described.

3. The reciprocating slide or plate E, in combination with the guide-plates C D, operating substantially as and for the purpose set forth.

4. In combination with the guide-plates C D, the reciprocating toothed bar Q, or its equivalent, for carrying forward the nails, substantially as described.

5. The reciprocating slide S, with its notched arm a^1 and spring 48, in combination with the guide-plates C D and the arm *p*, operating substantially in the manner and for the purpose set forth.

6. The adjustable guide-piece d^1, placed within the groove or passage b^1, as and for the purpose set forth.

7. The yielding block s^2, fitting into a notch in the guide-plate D, in combination with the arm s^1 and its spring 48, for turning the nail, substantially as described.

8. In a machine for automatically feeding or delivering forged or partially-made horseshoe-nails to other machinery, the intermitting-revolving carrier T, provided with a series of compartments or jaws for receiving and holding the nails, in combination with the pins 55 and spring-arms q' s', or equivalent devices, for opening the jaws to receive the nails and release them at the proper times, substantially as set forth.

144,227.—Ships' Windlass.—GEORGE H. REMINGTON, BARTON D. THAYER, and JOSEPH P. MANTON, Providence, R. I. Application filed June 27, 1873.

The single wheel located between the wildcats is connected with adjustable friction-nippers, or pawl and ratchet, by means of which arrangement the pump-brakes for operating the windlass can be located abaft instead of forward of the bits.

Claim.—1. In combination with a windlass-shaft for working the same, the single wheel F, and ratchet or friction pawls K K' applied to the sides thereof, substantially as described.

2. The wheel F, constructed with ratchet-teeth R on its periphery for a pawl-gear and double-flanged rims *b b*, in combination with sliding blocks I and ratchet or friction pawls K K', substantially as described.

3. The combination of a windlass-pump brake-head, L, constructed with slotted sectors *h h*, with the sliding blocks I, and links *d d'* for maintaining the proper position of the pawl or ratchet gear for all variations of the length of the stroke, substantially as described.

144,228.—Portable Fence.—GEORGE ROBINSON, Chillicothe, Mo. Application filed April 21, 1873.

The bars of one panel have oval openings to receive the tenons or projection of bars of the next panel, so that when adjacent sections of the fence are brought toward a straight line a firm bearing will be produced upon the tenons and the end brackets, this position being maintained by a brace inserted in gains in a pair of corresponding bars. The bars are pivoted to the brackets, and accordingly adjustable, as well as the brace, to uneven ground.

Claim.—The bars A, provided with the projections D and apertures E pivoted to the battens B and F, in combination with the brace I, when arranged and operated substantially as shown and described.

144,229.—Cut-Nail Machine.—JACOB RUSSELL, Providence, R. I., assignor, by mesne assignments, to himself and WILLIAM SPRAGUE. Application filed February 17, 1873.

The guide-bed G is made to move laterally and vibrate angularly by means of the sectors E E' and the racks F F'. The sliding nipper-carriage is moved forward by a pawl and ratchet. The nipper-jaws are pivoted in a standard, *b*, and are made with curved beaks, which are forced together by means of a cam, *c*, operated by the lever *d*.

Claim.—1. The guiding-bed G, with guiding-edges adjacent to its forward end, in combination with the sliding nipper-carriage and the mechanism for laterally moving the bed bodily at each end to and fro, substantially as shown and described.

2. The combination of the vibrating sectors E E', the pivoted racks F F', and the guide-bed G, substantially as described.

144,230.—Stove-Door.—AMBALOM S. SHONTZ, Quincy, Ill, assignor to COMSTOCK, CASTLE & CO., same place. Application filed July 14, 1873.

In a double stove or furnace door one is pivoted to swing vertically, and the other hinged to swing laterally. The upward-swinging door is provided with a rabbet on its lower edge, which fits a corresponding recess in the upper edge of the other door when both are closed, and makes a tight joint. Either door can be opened independently of the other.

Claim.—The door C, pivoted to swing vertically, and provided with rabbet B, in combination with the door A, hinged to swing laterally, and provided on its upper edge with a recess to receive the rabbet *b*, substantially as shown, and for the uses specified.

144,231.—Sulky-Harrow.—PETER SPEELMON, Knox, Ind. Application filed September 15, 1873.

A wheel-harrow having triangular sections hinged together, the central raising-lever having an adjustable slide for one of its connecting-rods. Foot-levers and connecting-rods for raising the sides of the sections for avoiding obstacles.

Claim.—1. The adjustable attachment *g*, in combination with rods *l l'* and the sectional harrow, as and for the purpose set forth.

2. The combination of standards P P', levers *s s'*, rods *r r'*, *t t'*, and foot-levers F F' with the sectional harrow and levers *l l'*, substantially as set forth.

144,232.—Non-Conducting Filling for the Walls of Dinner-Pails, &c.—OSCAR M. STILLER, Cleveland, Ohio. Application filed July 18, 1873.

Claim.—A filling or packing for use in dinner-pails, &c., as a non-conductor of heat, composed of lamp-black with or without an admixture of hair or other fibrous material, substantially as described.

144,233.—Corn-Planter.—JOSEPH STATZ, Cross Plains, Wis. Application filed April 7, 1873.

A rectangular frame is mounted upon two wheels, and the seed-boxes and seeding apparatus mounted thereon. One of the wheels has a driving-gear, and this puts in motion a pinion and crank-shaft, universally jointed, by which the seed-slides are worked.

Claim.—The combination, upon a suitable frame, of the seed-boxes E E with slides G G, connected at their front end, by couplings *d d*, with the levers H H, and the inner ends of said levers connected, by a single coupling, I, with the pitman J, the crank-shaft *f* with universal joint *e*, shaft *k*, pinion *m*, and cog-wheel K, all constructed and arranged substantially as and for the purposes herein set forth.

144,234.—Attachment for Soda-Fountains.—OSCAR F. STEDMAN, Westfield, N. Y. Application filed October 25, 1873.

The draft of a soda-fountain is secured upon the smooth surface of the discharge-pipe by a rubber band expanded by a nut.

Claim.—1. As an attachment for the draft-arm of a soda-fountain, the nozzle *a*, nut *c*, and rubber band *c*, in combination with the discharge-pipe, substantially as set forth.

2. An attachment for the draft-arm of a soda-fountain, consisting of a nozzle, *a*, a valve, and an extended tube, which serves to conduct the gas and soda-water down to the bottom of the tumbler, substantially as specified.

3. The combination of a compound valve for soda-fountains with the extended draft-tube *g*, substantially as shown and described.

4. The combination of a nozzle, *a*, nut *c*, band *c*, valve, and tube, arranged for operation substantially as set forth.

144,235.—Car-Propeller.—ROBERT STEEL and SAMUEL AUSTIN, Philadelphia, Pa., assignors of one-half their right to JOSEPH LEEDS, same place. Application filed December 20, 1872.

A heavy steel spring is arranged to revolve the axle by means of intermediate gear-wheels meshing into a gear-wheel secured to the axle. The power is modified at will by means of clamping-brake levers, the curved ends of which embrace a friction-disk on the axle, the brake-levers being opened or closed by a screw-shaft.

Claim.—In combination with a railroad-car, one or more coiled springs, A A, cog-wheels I I and K K, ratchet-wheels D D, spring-pawls F F, brake O, and bar S, all the parts being arranged to operate substantially in the manner described, and for the purposes set forth.

144,236.—Harrow.—ADONIRAM J. STEWART, Chillicothe, Mo. Application filed July 10, 1873.

A harrow provided with a series of spring-teeth supported on pivoted bearings in longitudinal beams provided with slides for adjusting the angle of the teeth, the slides being operated by means of a rock-shaft, lever, pawl, and ratchet.

Claim.—The spring harrow-teeth C, supported on bearings in the beams A, in combination with the slides G, operated by the rock-shaft M, provided with lever P, ratchet O, and pawl N, substantially as shown and described.

144,237.—Washing-Machine.—JOHN C. STEWART, Eureka, Ill. Application filed August 19, 1873.

In a suitable vessel is a false bottom with perforations. Above this are two plungers, working alternately, formed of shallow inverted boxes having divisions that form cells, in which are pins for pressing the clothes.

Claim.—The two shallow inverted boxes E E, having division-plates *f*, forming cells, in combination with the pins *g* and the perforated false bottom B, substantially as and for the purpose set forth.

144,238.—Paper Bag.—ORSON W. STOW, Plantsville, Conn. Application filed February 17, 1873.

Both sides of the bag have projecting portions, so that it may be opened without being turned over. One side of the bag is folded in and pasted, and the other is lapped over so as to form a double bottom without cutting the corners.

Claim.—1. A paper bag having its edges at the mouth corrugated and laid together in the manner and for the purpose described.

2. A straight-bottomed bag wherein the bottom is pasted and folded as set forth, so as to produce a double-bottomed bag, uncut at the corners, substantially as described and shown.

144,239.—Dropping-Platform for Harvesters.—PETER WARNER, Gilead, Mich. Application filed August 16, 1873.

The pivots of the extensible and tilting platform are supported in adjustable arms.

Claim.—The pivoted platform or table having its bearings supported in adjustable arms, and arranged to operate substantially as and for the purpose described.

144,240.—Car-Brake.—WILLIAM WARWICK and HENRY C. DUGGAN, Pittsburg, Pa. Application filed September 6, 1873.

Claim.—1. A brake-bar composed of a center-beam, A, bound with a wrought-iron strap, B, which wholly encircles it, and has massive ends for the attachment of the clogs, substantially as specified.

2. The brake-bar composed of the parts A B *b b* and wrought-iron clogs C, substantially as and for the purpose specified.

3. The clogs or brake-blocks C, constructed with center-bearings c^1 c^1 and a cross-bar, c^2, in combination with the shoes D provided with hook-formed lugs *d d'*, and the locking-bolt E, substantially as and for the purpose specified.

144,241.—Steam-Boiler and other Furnace.—WILLIAM WESTLAKE, 65 Mornington Road, Regent's Park, (administrator of CASIMIR SCHEMIOTH, deceased,) assignor to JOHN HEAD, Ipswich, England. Application filed August 6, 1873.

In front of the furnace are arranged two compressing feeding-rollers, adjustable by compressing-levers and weights, with a feeding-table, upon which the straw, &c., is placed and fed into the furnace, and combined therewith is a tank with oil or like material, which may be mixed with the straw, &c., to assist in burning it.

Claim.—The combination and arrangement, substantially as before set forth, of the furnace, the furnace-mouth, the compressing feeding-surfaces, and the feed-table, said surfaces being arranged between the furnace-mouth and the feed-table.

144,242.—Comb-Holder.—EVERETT E. WHEELER, South Norwalk, Conn. Application filed September 26, 1873.

The comb is held in a slot in the holder so that only a part of the teeth of one side project therefrom.

Claim.—A holder for fine-tooth combs, constructed substantially as and for the purpose described.

144,243.—Construction of Steam-Vessels.—THOMAS WINANS and WILLIAM LOUIS WINANS, Baltimore, Md. Application filed September 15, 1873.

Claim.—A steam-vessel constructed substantially on the plan patented by Ross and Thomas Winans, October 22, A. D. 1858, No. 21,917, and having a flat bottom, as herein described, so as to reduce the draft thereof, as set forth.

144,244.—Sand-Band for Vehicle-Axles.—JAMES B. WINCHELL and HARVEY W. RUGG, Benton Harbor, Mich. Application filed September 11, 1873.

Claim.—1. The sand or mud guard A A', made of two parts, which overlap one another, and are constructed to be put upon the axle, behind the collar thereof, and fastened together in that position, substantially as and for the purpose set forth.

2. The sand or mud guard made of two overlapping parts, and with a depression on its inner face, for the purpose of enabling it to serve as a scraper to the inner surface of the back hub-band.

3. The combination of the mud or sand guard, constructed with a depression on its inner face, and the bell-mouthed back hub-band, substantially as described.

144,245.—Baling-Press.—GEORGE WINSHIP, Atlanta, Ga., assignor to himself and ROBERT WINSHIP. Application filed September 1, 1873.

Claim.—The press with tie-blocks *g'* dovetailed upon its beams B', and with upright rods *e* passing up from its bottom E, and looping over grooved portions of the tie-blocks, and with arching rods *e' e'* passing through the tie-blocks over the beam J, all constructed and combined substantially in the manner and for the purpose herein described.

144,246.—Door-Check.—JACOB RADER, Olathe, Kans. Application filed September 13, 1873.

A slide, arranged in a recess in the edge of a door or gate, carries two legs pivoted to the lower edge. These two legs are forced outward by means of a spreader or stop, over which they work, as they are forced against the floor or ground. The two stops brace the door against movement in either direction.

Claim.—1. The movable stop-legs A A and spreader C, combined and arranged in a cavity of gate or door, as and for the purpose described.

2. The slide B, having the legs A A pivoted to the lower end and the lever I pivoted to the upper end, as described, to enable the said legs to be forced into the ground.

144,247.—Cultivating-Plow.—WILLIAM RAGSDALE, Otsego, Ohio. Application filed August 9, 1873.

The standard has an offset to afford seats for two kinds of plows, the lower one for a small plow designed to run under the surface in an almost horizontal position. The upper projection forms a seat for the larger plow, which throws the earth toward the rows of plants.

Claim.—The standard G *g'*, constructed as described, and combined with the foot E, as and for the purpose specified.

144,248.—Propelling Canal-Boats and other Vessels.—LOUIS RASTET, New York, N. Y. Application filed June 14, 1873.

Claim.—The propeller-wheels B B, combined with close channels A A, inclined downwardly from bow to stern, and receiving the water from the surface in front of the boat and discharging it at the rear, as described, whereby the surface-waves from the front of the boat that tend to cause the washing of the banks are prevented, as and for the purpose set forth.

144,249.—Hot-Air Draft for Furnaces.—ENOCH BOUGHTON, South Norwalk, Conn. Application filed August 6, 1873.

A pipe, arranged in connection with the steam-space of a boiler, is coiled beneath the furnace-grate, after being turned downward and outward, for the retention of the moist or surcharged steam, and then arranged to discharge the superheated steam about the port, by which the air to support combustion is admitted by a perforated cross-pipe in the front.

Claim.—1. The combination of the pipe B, coiled as described, and turned downward and outward at C, and arranged under the grate, with the discharge-pipes A A having openings *a a*, for the purpose specified and shown.

2. The method herein described of drying and heating steam, for mixing the air-draft of a furnace to promote and assist combustion, by means of the retaining and coil pipe B in connection with discharge-pipes A A and discharge-openings *a a a*, arranged as specified and set forth.

144,250.—Guano and Seed Distributer.—JAMES H. BOYD, Plain, S. C. Application filed July 19, 1873.

Between the seed-hopper and the plow-tube or drill-tooth is a shaking-shoe, operated from a toothed driving-wheel by means of a rod or lever.

Claim.—A plow-tube, A I, and shaking conveyer F, combined with seed-hopper E, as and for the purpose described.

144,251.—Scissors.—HORACE S. BREEDEN, Barry, Ill. Application filed October 4, 1873.

Two eyes are upon one shank, while the end of the other shank is merely rounded so that the thumb may readily press it down. A metal band, working in a groove near the pivot, fastens the blades together when not in use.

Claim.—1. As a new article of manufacture, the combined scissors and clippers, having a shank with two rings, and a spring acting on the other curved shank, to be used and operated substantially as described.

2. The curved shank of the scissors having a pivoted spring-catch, in combination with the ring-shank, having a recess with slotted extension for locking the blades into closed position, for the purpose set forth.

144,252.—Walk-Edger.—ISAAC V. BROWER and JOSEPH C. HIGGINS, Millstone, N. J. Application filed July 26, 1873.

A drum, to which is secured a circular cutter, is placed upon one end of an axle, on the opposite end of which is an ordinary wheel. The drum rotates by coming in contact with the turf, which is cut off in narrow strips and turned back by a share. A gage prevents the plow from entering the earth too deep.

Claim.—The drum F, circular cutter G, plow H, and gage I, arranged near one end of an axle, D, having a wheel, E, at the other end, in the manner and for the purpose described.

144,253.—Pipe-Tongs.—JAMES R. BROWN, Cambridgeport, Mass., assignor to himself and HAZEN P. HUNTOON, same place. Application filed October 1, 1873.

The adjusting-screw is connected to the hooked jaw by a swivel, and is incapable of an endwise movement relative to said jaw.

Claim.—The adjusting-screw D, arranged to screw into or through the fulcrum-pin C, and pivoted in and connected with the hooked-jaw lever A, all substantially as described and represented.

144,254.—Composition for Removing and Preventing Incrustation in Steam-Boilers.—CHARLES BURFITT, Surrey House, New Wimbledon, England. Application filed July 26, 1873.

The composition consists of oak-galls, Australian bark, Irish moss, filtered water, and soda, and when in block-form glue is added.

Claim.—A compound for removing and preventing incrustation in steam-generators, consisting of oak-galls, Australian bark, and Irish moss in about equal parts, the quantity of water and preparation being as described.

144,255.—Plow.—EDWARD CARTWRIGHT, De Witt, Neb. Application filed October 16, 1873.

The share lies nearly flat with the ground; the standard is high, and the mold-board convex and very narrow, diminishing in width to its termination, and rising gradually from the heel of the share.

Claim.—The point or lay *a*, having a flat cutting-edge and a convex surface, in combination with the mold-board *g*, made convex its entire length, and contracting and diminishing in width to its termination, substantially as shown and described.

144,256.—Door-Spring.—HENRY CODY, New York, N. Y. Application filed July 26, 1873.

A combined door-spring and hinge has within the shell or casing a circular spring, a pair of swinging jaws clasping around a central stud, and an arm carrying a roller upon its end, the two together serving as a spreader.

Claim.—The combination described of the circular spring B, jaws C C, and vibratory jaw-spreader H I, whereby the door is held open or closed.

144,257.—Car-Coupling.—WILLIAM R. COOVERT, London, Pa. Application filed February 3, 1873.

When the block which engages the head of the coupling-hook is raised it carries with it the auxiliary pin.

Claim.—The pivoted latch-block G, pin N, and hook H, in combination with the chain T, arm S, shaft O, ratchet Q, and pawl R, whereby the said block and pin may be raised together, and the hook thereby disengaged, as set forth.

144,258.—Lozenge-Cutting Machine.—GEORGE H. COPPING, Toronto, Canada. Application filed March 22, 1873.

By placing the cutting and printing devices upon the same frame and operating them from beneath by means of the cam-wheels and vertical rods perfect harmony of time and character of movement are attained, and a single presser-head serves both the cutting and printing devices.

Claim.—1. The combination of vertically-moving printing devices with vertically-moving cutters, both being positively and simultaneously lifted by the same lifting mechanism, to print as well as to cut from the under side of the sheet of dough.

2. The mechanism comprising the bevel-wheels K L, diagonal shaft M, worm N, and worm-wheel O, for communicating motion to the apparatus P P' Q Q' from the first-motion shaft C, as described.

3. The vibrating head V, constructed substantially as described, in combination with the slotted arm 1, fixed stop or pin 4, and the pawl and ratchet-wheel for feeding the sprea *f*.

4. The described mechanism for giving to the head V its vibratory movement, consisting of the stud R, rod S, arm T, and shaft U, as arranged and described.

5. The combination, with the vibrating head V, operating above the sheet of dough, of the system of printing trough and rollers beneath the sheet, such system having a positive vertical intermittant motion in addition to the rotary motion of the rollers, the whole substantially as specified and described, and for the purposes set forth.

144,259.—Metallic Cornice and Gutter.—JOHN B. CORNELL, New York, N. Y. Application filed October 4, 1873.

A mode of strengthening sheet-metal gutters and cornices by means of a corrugated metal plate between the lining and the outer cover in lieu of wooden planks.

Claim.—The employment of channel-iron bed-plank B for supporting the lining of gutters, cornices, and roofs, when the outer cover is thin sheet metal, substantially as specified.

144,260.—Car-Starter.—ARCHIBALD H. CROSIER, New York, N. Y. Application filed September 6, 1873.

Claim.—The combination, with the axle of a car-truck, of the levers J J' *u*, frame I, gear-wheels P Q R D, and clutch mechanism G F H, to operate in the manner and for the purpose described.

144,261.—Water-Wheel.—GATES CURTIS, Ogdensburg, N. Y. Application filed October 4, 1873.

A solid conical bonnet or cap is placed on the supporting-case and provided with the requisite number of apertures for admitting the water. The gate-ring is also conical and supported on the bonnet and arranged with inclined upper and lower rims, which form extensions of the curved rims of the wheel.

Claim.—The bonnet gate-ring E, made with inclined rims E', which carry the chute-pads F, with the outwardly-curved chutes F', and having openings *b'*, arranged over corresponding apertures *b* of the bonnet or cap D, for regulating the flow of the water, as described.

144,262.—Die for Pressing Hats.—JASON DEAPER, Barre, Mass. Application filed September 30, 1873.

A semicircular groove is formed in the die when cast, to receive a steam-pipe, which is secured in position by filling up the groove with molten metal, &c.

Claim.—The die *a*, having the groove or recess *c* formed in it to receive the pipe *c*, the pipe being secured in position by filling up the groove with molten metal or other suitable material, substantially as shown and described.

144,263.—Adjustable Scaffold.—JOHN DILLON, New York, N. Y. Application filed September 13, 1873.

A combined scaffold and ladder, arranged to be readily expanded into a painter's scaffold, adjustable to different heights, or compactly folded for transportation, the detached parts serving as step and extension ladders.

Claim.—1. The truss A B, formed of two parts hinged together, and having an intermediate recess, *c*, combined with supporting pieces braced by hinged top board d^1, as and for the purpose described.

2. The connecting top boards d d^2 of parts A B, having vertically-adjustable bolts *f* for guiding longitudinally-connecting supports, as described.

3. The recessed rear part B, connected with sliding pieces B' by screw cross-rod *p*, and washer-plates o^3, substantially as set forth.

144,264.—Combined Extension Measuring-Rod and Divider.—GEORGE H. DISCHER, Mobile, Ala. Application filed August 30, 1873.

A measuring-rod composed of three sections, the central having guides in which the terminal sections are adjustable longitudinally and may be clamped. The sections have in each end sockets for points or pencils.

Claim.—1. A combined extension-rod and tram, constructed as herein shown and described.

2. The combination of the point and pencil, arranged in the ends of the extension-pieces C D, with center piece A, for the purposes set forth.

144,265.—Device for Dressing the Sides of Nuts.—ISSACHAR DODG, New Market, N. H., assignor of one-half his right to ORRIN MURRAY, same place. Application filed August 9, 1873.

To the bed-plate are secured, by bolts passing through slots, two carriers, on the inner faces of which cutters are fastened that correspond to the form of the nut. The cutting-dies have double cutters, one within and below the other. The nut is carried down by a plunger.

Claim.—1. The finishing-dies E having the inclined and additional cutting-edge *e'*, in the manner and for the purpose substantially as described.

2. The dies E having angular or beveled edges on one side, fitting into dovetail or angular recesses in the jaws D, and secured therein by means of the beveled block *f* and screw bolt and nut *f'*, substantially as described.

3. The movable and adjustable jaws D with their dies or cutters E, in combination with the base-plate C, when constructed in the manner and for the purposes described.

144,266.—Watch-Gear-Cutting Machine.—AGOSTINO DURENI, New York, N. Y., assignor to himself, GUISEPPI ROSSI, and FRANK E. MILLER, same place. Application filed July 7, 1873.

The cutter, attached to the laterally and perpendicularly adjustable swinging carriage D, is adjusted to the gage R on the sliding carriage K, which carries the gear to be cut, and the gear carried on the adjustable carriage K is adjusted to the gage P, attached to the fixed bed or support of the machine.

Claim.—1. The combination, with the swinging adjustable carriage D and the several working parts mounted upon and carried by it, of the adjustable carriage K and the several working parts mounted upon and carried by it, as and for the purpose specified.

2. The combination of the swinging gage P with the cutter-head F and its attachments, and the chuck *f*, as and for the purpose specified.

3. The combination of the swinging gage R with the chuck *f* and cutter-head F and its attachments.

144,267.—Combined Over Bosom and Collar.—ISAAC T. DYER, Canton, Me. Application filed October 3, 1873.

A "dickey" having a spring in the band to clasp around the neck.

Claim.—The over-bosom C, provided with a spring neck-band, A D, substantially as and for the purpose set forth.

144,268.—Balanced Slide-Valve.—JOSHUA EVERED, Muskegon, Mich., assignor to himself and JOSHUA DAVIS, same place. Application filed September 13, 1873.

The slide-valve is provided with a packing-ring fitting into a sleeve-bearing against the steam-chest cover, and has an interior cylinder having a piston which is set out by a spring against the inside of the sleeve.

Claim.—A slide-valve having an outer cylinder, D, and an interior cylinder, H, a sleeve, F, and piston G, arranged substantially as and for the purposes described.

144,269.—Fender.—GILES F. FILLEY, St. Louis, Mo. Application filed September 22, 1873.

A fender or foot-rest is inserted between brackets or continuations of the end plates of a stove.

Claim.—The combination of front and back plates A and B, brackets or projections D D', and foot-rest C, substantially as and for the purpose set forth.

144,270.—Watch.—ARNOLD FRANKFELD, New York, N. Y. Application filed April 29, 1873.

A removable sectional plate, supporting the balance and escapement and their bridges, is let into the front plate.

Claim.—The quarter-plate *d* and disk *e*, carrying the balance and parts of the escapement, and removable from the plate *a*, substantially as and for the purposes set forth.

144,271.—Locomotive.—JAMES S. FRENCH, Alexandria, Va. Application filed June 7, 1873.

Claim.—1. The pair of adjustable grooved driving-wheels C C, in combination with the common driving-wheels B B and the connecting-rod *d*, substantially as described, for the purposes set forth.

2. The combination of the common driving-wheels B B with the grooved driving-wheels C C, the connecting-rod *d*, the curved guide *m*, and the hoisting apparatus E or its equivalent, substantially as and for the purposes herein described.

3. One or more pairs of ordinary driving-wheels connected with a pair of wedge-shaped grooved driving wheels, which may be lifted above the rails, or pressed down upon the rails, at the will of the engineer, substantially as described.

144,272.—Land-Roller.—WILLIAM H. GROW and CRAWFORD M. SLOAN, Darien, Kans. Application filed June 21, 1873.

The hollow cylindrical rollers are formed of staves drawn together and secured by rods running through each one transversely, and firmly secured by nuts. The tires of the wheels fit into grooves formed in the inner periphery of the cylinders.

Claim.—1. In combination with an axle and wheels, the sectional cylinders A of a land-roller, having inner peripheral grooves for receiving the tires of the wheels, as shown and described.

2. In a land-roller, the cylinders A, formed of staves or sections *a b*, connected by the rods *c* and nuts *e*, arranged as shown and described.

144,273.—Machine for Shaving Leather.—DAVID Y. HAAS, Hepler, Pa. Application filed August 30, 1873.

The knife is mounted upon a frame, which is made adjustable to provide for varying thicknesses of leather.

Claim.—1. A machine for shaving leather composed of the bed A, adjustable frame D, roller F, and presser-bar G, arranged to operate substantially as shown and described.

2. In combination with roller F, the hinged frame D carrying knife M, and having mortised tongue H, of the slide I, provided with the inclined bar J, all as shown and described, to operate as specified.

3. The tongue H and bar J, in combination with the slide I, as and for the purposes described.

4. The gage K, in combination with the slide I, for the purpose described.

144,274.—Self-Closing Telegraph-Key.—WILLIAM HOCHHAUSEN, New York, N. Y. Application filed October 3, 1873.

Key-lever hung in a yoke so as to have a lateral motion. Yoke hung in the ordinary bearing, for the vertical motion. Key, when not in use, is thrown laterally, by a spring, against circuit-closing point *r*.

Claim.—The telegraphic key in which the lever is mounted upon two centers, to allow of a lateral as well as of a vertical movement, in combination with the circuit-closing points *r s*, substantially as and for the purposes set forth.

144,275.—Spark-Arrester.—JAMES HUGHES, Scranton, Pa. Application filed October 11, 1873.

Two perforated plates of equal size are arranged adjustably, one over and the other beneath the central opening of two perforated rings, also of equal size. The whole held in position by means of bolts.

Claim.—The combination of the two equal-sized perforated rings A and the two equal-sized perforated circular plates B with each other adjustably, substantially as herein shown and described.

144,276.—Slide for Extension-Tables.—JESSE KING, Oswego, N. Y. Application filed September 6, 1873.

The ends of the slide-bars are provided with arched slide-plates having short extensions, which are inclined inwardly, and which slide in similarly-inclined grooves of the adjacent slide-bars.

Claim.—As an improvement in slides for extension-tables, the combination of slide-bars A, arched side-plates B having extensions B' running in inclined grooves *b*, and bars A, all arranged as and for the purposes described.

144,277.—Cement Pipe-Traps.—ALBERT A. LOVELL, Worcester, Mass. Application filed August 25, 1873.

A central core is made of plaster or other easily-frangible material. Around this the trap is cast, and the core then chipped out. Iron stripes may be embedded in the core, and projecting therefrom to facilitate its removal.

Claim.—A cement trap for drain-pipes and other purposes formed in one piece, substantially as described and set forth.

144,278.—Axle for Vehicles.—LEWIS MARTIN, Oswego, N. Y. Application filed March 29, 1873.

The sections of the axle are stamped from blanks.

Claim.—1. The hollow metallic axle, constructed of two sections clamped together, one above the other, by shrunken collars and through-bolts, substantially as described.

2. The hollow sectional axle, bound together by through-bolts, having partitions to form oil-reservoirs at either end, and also to prevent the escape of the lubricating material through the bolt-holes, substantially as set forth.

144,279.—Cooking-Stove.—JOHN MCMASTER, Dayton, Ohio. Application filed March 4, 1873.

A plate or rack for the bottom of an oven of a cook-stove, sliding in ribs or guides, which also act as supports when it is drawn out. A bracket in the side of the stove can be turned under the plate thus drawn out, for additional support.

Claim.—1. The oven-rack C, constructed and arranged with reference to the oven and ribs *s* and *c*, substantially as described.

2. The adjustable rib *c'*, constructed and arranged substantially as and for the purpose specified.

3. The bracket K, as arranged with reference to the side of the stove and the rack C, substantially as described.

144,280.—Slate-Washer.—JOHN G. MURRAY, Matteawan, N. Y. Application filed June 3, 1873.

Claim.—As a new article of manufacture, a slate-washer consisting of a block of compressed felt, *a*, in combination with a suitable inclosing case or box, *c*, substantially as shown and described.

144,281.—Cotton Chopper and Cultivator.—MANSFIELD L. NEARE, Double Bridges, Tenn. Application filed March 22, 1873.

The cultivator-shovels are secured to the standards by means of bands passed through slots formed in the shovel-blades.

Claim.—The bands *a* passed through slots in the shovels M, and secured in the notches of standards L, by means of screw-bolts, as shown and described.

144,282.—Slide-Valve.—ARCHIBALD S. NELSON, Connellsville, Pa., assignor of one-half his right to HIRAM F. HAMMON, same place. Application filed June 3, 1873.

Two additional openings are arranged in the valve-seat, and two in the valve, by which means the steam is more quickly admitted into the cylinder, and a full opening is given with a shorter stroke, thereby avoiding friction and expense.

Claim.—The valve-seat 1, having extra receiving-ports 5 5 opening into ports 2 and 3, in combination with the side-valve 6, having two openings, 7 and 8, so placed as to open the ports 3 and 5, or the ports 2 and 5, when taking steam, and close the opposite port 5 when exhausting, as herein shown and described.

144,283.—Match-Box.—MORRIS L. OHUM, Philadelphia, Pa. Application filed June 21, 1873.

The match-boxes are attached to the "rose" or "bracket-back" of a gas-bracket.

Claim.—In combination with the bracket of a gas-burner, one or more match safes or boxes attached permanently to the bracket-plate, substantially as shown and described.

144,284.—Composition for Purifying Illuminating-Gas.—SAMUEL P. PARHAM, New York, N. Y. Application filed September 13, 1873.

Claim.—The composition for purifying illuminating-gas, produced of sawdust, lime, copperas, oxide of iron, and water, substantially in the manner and in the proportions specified.

144,285.—Printing-Telegraph.—GEORGE M. PHELPS, Brooklyn, N. Y. Application filed April 8, 1873.

Printing and type-wheel mechanisms run by independent motors. Type-wheel controlled by polarized electro-magnets, through which alternating currents pass. Printing-magnet made with prolonged poles, and with core surrounded by non-magnetic envelope to retard magnetization. Is charged, releasing printing mechanism, upon a prolonged closing of circuit on current of either polarity.

Claim.—1. In a printing-telegraph, a shaft, that by its revolution actuates the printing-lever and impression-pad, in combination with a let-off mechanism applied to that shaft, and an armature and electro-magnet that are energized by a pause with the circuit closed to hold the type-wheel in position while the printing takes place, substantially as set forth.

2. A printing-telegraph, in which the step-by-step movement of the type-wheel is regulated by two electro-magnets, and the printing is effected by a revolving mechanism, in combination with a third electro-magnet in the same metallic circuit that is rendered operative by a pause with a closed circuit and the let-off mechanism for the impression, substantially as set forth.

3. A type-wheel that is revolved by a spring or other motor, and a recoil-escapement connected with the armature of an electro-magnet, in combination with a unison-stop that arrests the rotation of the type-wheel only when the said type-wheel arrives at the correct unison position, substantially as set forth.

4. A magnet made with prolonged poles to retard the accumulation of magnetic energy, in combination with the printing-lever and the armature for moving or controlling the movement thereof, substantially as set forth.

5. A magnet with a non-magnetic metallic tube surrounding the core, in combination with the printing mechanism, for the purposes and as set forth.

144,286.—Balance.—EDWARD C. PICKERING, Boston, Mass. Application filed August 9, 1873.

A balance-beam, suspended by thin steel plates or springs, has a spirit-level arranged upon it, and has from its short arm two scale-pans suspended, one above the other, and upon its long arm are two adjustable weights.

Claim.—In combination with base-frame B and pillars *b*, the scale-beam C, with spirit-level D and adjustable weights E E′ at one end, and scale-pans F F′ at the other end, substantially as and for the purpose described.

144,287.—Clock-Escapement.—ALOYS PLATT, New York, N. Y. Application filed August 16, 1873.

The pendulum hangs behind the frame, through a slot in the back of which it is connected with a swinging arm, which bears the impulse-pallet, and a transverse pivoted arm which strikes another swinging arm, bearing the detent-pallet, and forces it away from the escape-wheel at each vibration.

Claim.—1. A spring-pressed swinging bar, B C, that engages the escape-wheels, provided with a side stud, E, operated by an arm, F, as and for the purpose described.

2. The arm G, having pallet K at the lower end, pivoted to the frame at H, and connected with the pendulum through slot J, as and for the purpose set forth.

3. The pin *b*, passing through a slot of bar G, and combined with the arm F, as and for the purpose specified.

144,288.—Door-Latch.—OREN B. RAND, Kalamazoo, Mich.—Case C. Application filed August 9, 1873.

Improvement on patent No. 140,269, June 24, 1873. The operating parts are inclosed in a shell, and so arranged as to be attached to the face of the door, instead of mortising into it. A crooked lever with unequal arms, and knob-handle extending outside the casing, operates the bolts, the handle being stayed by a suitable catch, while a spring-catch is attached near the bottom to look into the lower bolt.

Claim.—The crooked lever D, catches C C′, links L, and friction-rollers F, in combination with the rods R, bolts B, and springs S, all arranged on the face of the door so as to work the bolts at either or both ends, when constructed, arranged, and operated as described and shown, for the purpose set forth.

144,289.—Blackboard.—JAMES REBER, Nebraska, Ohio. Application filed July 26, 1873.

A blackboard of three portions hinged together is mounted to rotate upon a standard, and is adjustable therein as to height. The board may be inclined and fixed at any point within a quarter of a circle, or the whole board set horizontally and used as a table-top, with the side leaves folded down like table-leaves or not.

Claim.—1. The adjustable folding blackboard, consisting of frame or stock A, rack and ratchet mechanism C *a*, and blackboard B, pivoted arm D and hinged bow-lever E, arranged and operated substantially as and for the purpose described.

2. The blackboard B, consisting of central leaf B¹ with hinged side leaves B², and lever T, pivoted to bolts *l*, and set by thumb-screws *m*, substantially as set forth.

3. The T-shaped arm D, turning on rack C, and having guide-slot with thumb-screw A to adjust bow-lever E, and producing any inclination of board B, as described.

144,290.—Churn-Dasher.—GEORGE RIDLER, Richardsville, Iowa. Application filed July 26, 1873.

The dasher consists of two pairs of bars, each pair transverse to the other, thus forming a solid hub at the center in which the dasher-rod is inserted. Each bar is wide beneath and inclines on both sides to an acute edge above, and is hollowed beneath in like manner, so that an end view shows them V-shaped.

Claim.—The dasher M formed of bars crossing each other, as specified, said bars made V shape with V-grooves in their under side, as and for the purpose specified.

144,291.—Farm-Gate.—JACOB C. ROHRER, Gomer, Ohio. Application filed June 21, 1873.

A gate which swings horizontally in either direction, or slides past the hinge-post so as to open half its width through a secondary frame, with pulleys for the upper rail to glide upon, said secondary frame fortifying and balancing the whole gate in its swinging movements.

Claim.—The frame A, consisting of vertical pieces *a a′*, oblique side pieces *e f*, rollers *i i*, and lateral piece *g*, the said parts being constructed and arranged substantially as and for the purpose described.

144,292.—Machine for Riving Shingles.—CHARLES SHELMANDINE, Jefferson, N. Y. Application filed September 13, 1873.

The shingle or stave bolts are placed upon a vertically-reciprocating table, and split into pieces of the desired thickness by being forced against a series of knives.

Claim.—1. The combination of the movable table A, stationary blades B, one or more sets of movable blades, C D, and mechanism for operating the table and the sets of movable blades successively, substantially as specified.

2. The double-toothed rack A′, pinions B′, catch-bolt C′, and spring D′, combined and arranged substantially as specified.

3. One or more blades, C D, bars S, cross-heads T, bars V, toothed bars W, and pinions X, combined and arranged substantially as specified.

4. The combination of the yoke Q′ and discharger K′ with the table A and splitting-blades, substantially as specified.

144,293.—Car-Coupling.—WARREN B. SNEDAKER, Syracuse, N. Y. Application filed April 19, 1873.

To uncouple, the lid upon which the long arm of the lever abuts is raised and the link may be drawn out, when it carries forward the long arm a quarter turn. In this position it is held by a weight-bar acting on pins which pass through the short arm. The link, on re-entering to couple, strikes the short arm and throws it back until the long arm has passed behind the abutment on the lid.

Claim.—The combination of forked bar J with pivoted hook C, cover G, and link B, substantially as shown and described.

144,294.—Process of Manufacturing Paper from Grains.—CHARLES V. STERLIN and JOSEPH STERLIN, New York, and HENRICH A. HAAM, Brooklyn, N. Y. Application filed February 15, 1873.

Claim.—The process of preparing grain-fiber for bleaching and for being subsequently manufactured into paper by passing the moistened fiber on wire-gauze sheets between compressing-rolls; secondly, water-washing it on sieves; and thirdly, macerating it in caustic alkali, as set forth.

144,295.—Slide-Valve.—WILLIAM STEPHENS, Pittston, Pa. Application filed August 4, 1873.

A wedge-shaped valve between two walls, with inlet and outlet ports, is provided at top and bottom with channels for the admission of steam, which is to prevent leakage and also to balance the valve.

Claim.—The valve A, having flanges G G, combined with walls B, having the upper and lower steam-channels I I, arranged as and for the purpose described.

144,296.—Furnace for Steam-Boilers.—UMIAH B. STERLING, Madison, Ind. Application filed December 19, 1872.

A plate, with air-tubes and overlaid with fire-brick or tiles, is provided in place of the grate-bars, and forms a cover for a hot-air chamber connected with the draft. A system of pipes extends above the hot-air chamber and back under the boiler in the combustion-chamber, and said pipes are connected by hollow perforated castings, by which hot oxygen is supplied. The carbonic-acid gases are drawn from the uptake by an exhaust-fan and returned to the hot-air chamber.

Claim.—1. The combination of a close perforated fire-bed, F, and a close hot-air chamber, D, which receives a blast of air through a heated pipe or pipes, H H, substantially as herein specified.

2. The combination, with the close hot-blast-supplying chamber D, of hot-air-supplying pipes *c c* and hollow perforated castings A A in the combustion-chamber A, substantially as herein specified.

3. In combination with the hot-air chamber D, pipes H, H, and I, plate F, and tubes *a a*, the device consisting of the system of pipes L and M, valve *i*, and an ordinary exhaust-fan, when arranged substantially in the manner shown, and for the purpose set forth.

144,297.—Link-Guide for Car-Couplings.—WILLIAM WARDNER and WILLIAM L. D. JOHNSON, Crosbyborough, Ky. Application filed June 14, 1873.

The link-guide is carried forward by a weight suspended from its rear end. When the draw-heads meet the guide is forced back out of the way, and is caught and retained by a spring-catch lever. This lever is operated to release the guide from the side of the draw-head.

Claim.—The hinged and grooved curved frame D, the sliding curved frame E, the supporting and adjusting frame F, and hand-screw G, the chain, weight, and roller J, M, K, and the pawl and spring O P, in combination with the bumper-head A, substantially as herein shown and described.

144,298.—Car-Coupling.—JAMES M. WELLS, Painesville, Ohio. Application filed April 18, 1873.

The link is guided by means of the pin, which has a shoulder about at its center which rests upon it and balances it on a fulcrum in the mouth of the draw-head. The degree of elevation or depression is regulated by another projection on the pin, which rests on an incline formed on the top of the draw-head about the pin-hole. The catch-bar B is held from connection with the link by a pawl which catches in a notch in the side of the draw-head, when the bar is raised and remains until it is forced away by the head of the entering link.

Claim.—1. The combination, with the bumper A, notched at *b*, of the catch-rod B and pawls C, as and for the purpose described.

2. The combination, with the bumper A, having slot *a*, notches *b*, fulcrum O, and planes *c c*, of the pin D, all constructed as described.

144,299.—Eaves-Trough Hanger.—THOMAS G. WILLIAMS, Akron, Ohio, assignor to WILLIAM WARNER & Co., same place. Application filed August 9, 1873.

Claim.—An eaves-trough hanger having prolonged end C, adjustable vertically in clamp E, and turned over to hold the trough at any elevation desired, thus avoiding the use of an adjusting-screw.

144,300.—Grave-Covering.—JOSEPH R. ABRAMS, Greenville, Ala. Application filed August 8, 1873.

Claim.—1. The combination, with a cement or other artificial grave-mound, of the plate D, supported directly or indirectly upon subjacent arches A placed across the grave, as and for the purpose described.

2. The combination, with arches A and plate D, of the intermediate frame B, as and for the purpose described.

3. The plate D, constructed, as described, with oval recess *d*, to support therein the edges of the cement shell or mound with face *d′*, as set forth.

4. A grave-mound plate, D, having the head-plate F secured detachably, as and for the purpose specified.

144,301.—Hemp-Brake.—JOHN F. ADAMS, Lexington, Ky. Application filed April 28, 1873.

A small cylinder is journaled so as to be let into the face of the table. Stripe are longitudinally set upon this cylinder, their faces radial to its axis, their backs convex. The flax is fed to this cylinder, which presses it and carries it down and delivers it between two unequal drums having the same kind of stripe which whip the material and draw it out, one end of it being held by the operator.

Claim.—The combination of the cylinder D with the two drums E and G, all of different sizes, and each provided with the ribs *a a*, said cylinder and drums revolving at different rates of speed, as and for the purposes herein set forth.

144,302.—Stocking-Supporter.—ALEXANDER C. ADAMS, Cambridge, Mass. Application filed September 24, 1873.

A combined shoulder-brace and stocking-supporter.

Claim.—As a new article of manufacture, the combined stocking-supporter and shoulder-brace, consisting of the shoulder straps or loops *a a*, and their back connection *b*, and pendent stocking-sustaining straps B B C C C C′, all arranged as specified.

144,303.—Stocking-Supporter.—ALEXANDER C. ADAMS, Cambridge, Mass. Application filed September 11, 1873.

A spring-pin for attaching a suspender-strap to a stocking.

Claim.—As a new article of manufacture, the sock-supporter attachment composed of a single wire, pointed, crossed, and bent in the manner, and provided with helices, all substantially as described and represented, and for the purpose set forth.

144,304.—Portable Stall for Horses.—JOHN W. ADAMS, Rockville, Ind. Application filed September 27, 1873.

Double posts for the head and foot, the ends of the stall side boards to pass between each pair and rest on transverse pins, which hold the pairs of posts together. Brackets on the sides of the boards receive splines or keys to hold the boards together. These splines may be driven into the earth or secured to a floor. One of the rear half-posts is pierced for attachment to a joist or rafter above. Pins through the head-posts serve to support a trough.

Claim.—A portable stable-stall constructed as described, and consisting of the double upright beams A and B and the boards C C′ C″, with their fastenings, substantially as set forth.

144,305.—Horse Hay-Rake.—ALEXANDER AMOS, Potsdam Junction, N. Y. Application filed June 3, 1873.

A bell-crank lever, pivoted at its angle to the rake-head, bears on its rear horizontal arm the presser-bar, and its other arm serves as a hand-lever to operate the presser-bar, and has a hook to interlock with the lifting-lever, and thus hold the teeth in an elevated position, when desired.

Claim.—1. The thimbles A, having the sockets *a′*, made to run parallel with and to the front of bar B, so as to obtain a fulcrum on the latter, by which the teeth can be sprung into the grooves *b b*, in connection with the shank C, constructed so as to permit the teeth to lie squarely against the same, substantially as and for the purposes set forth.

2. The curved lever F, having sockets *e e* to receive the removable handle *d*, in combination with the hooked lever G, presser-bar H, lever D, having an angular arm provided with holes, and lifting-bar E, the whole constructed and arranged substantially in the manner and for the purpose set forth.

144,306.—Horse Hay-Rake.—ALEXANDER AMOS, Potsdam Junction, N. Y. Application filed September 16, 1873.

A latch is used to lock together the presser-bar, the rake-teeth, and the dumping or lifting bar, which, without it, swing independently.

Claim.—1. The latch *f*, in combination with connecting rod or bar *g*, supporter *e*, bar A, and teeth *b*, constructed and operating substantially as and for the purpose set forth.

2. The thimble *c*, having the continuous groove *e* running along the under side thereof from eye *a*, and terminating above in a cavity or depression, *r*, to receive the tooth and its hooked end, substantially as set forth.

144,307.—Sash-Molding.—RALPH L. ANDERTON, New York, N. Y. Application filed October 4, 1873.

Claim.—The above-described sash-molding, constructed of the wooden sash-box head A, incased in the sheet-metal covering B, and containing in the groove in its upper surface an edge or portion of the metal bar C, to or upon which the said covering is fastened, as and for the purposes set forth.

144,308.—Plow.—AUGUST ANSCHUTZ, ANTON SEIDEL, and MICHAEL WEBER, Livingston county, Mo. Application filed July 21, 1873.

The base or foot of the plow is widened by a fender encircling it, and supports not only the usual standards, but a shaft to which the plow is attached, which revolves sufficiently to throw the furrow either to the right or left.

Claim.—1. The foot F, provided with the fender E and shield H, for the uses and purposes specified.

2. The foot F, provided with the fender E and socket or journal F′, in combination with the revolving standard I, lever L, and ratchet E, substantially as shown and described.

144,309.—Drop-Light and Hanger.—GEORGE F. BLAKER and WILLIAM F. CRITER, Philadelphia, Pa. Application filed September 5, 1873.

The sliding pipes are located outside the supply-pipe, and are governed by a sliding weight, the whole being inclosed by a tube above the distributer.

Claim.—1. The combination of the supply-pipe E′, main pipe C, and sliding pipe E, said main and sliding pipes being apart from each other and not concentric, and located within the covering-tube G, as specified.

2. The covering-tube G, located above the body D of an extension gasalier, and inclosing the counterbalancing-weight, said weight being connected to the sliding pipe by cords and pulleys, and moving vertically within the confines of said covering-tube, substantially as and for the purpose set forth.

3. The combination of the main pipe C and sliding pipe E, said pipes being apart from each other and non-concentric, with the counterbalancing-weight F connected with said sliding pipe by cords and pulleys, as shown, all of said parts being located within the covering-tube G, as specified.

144,310.—Process of Preserving and Condensing Milk.—GAIL BORDEN, White Plains, and JOHN G. BORDEN, South East, N. Y. Application filed October 30, 1873.

Heat above 212° Fahrenheit and condense *in vacuo*.

Claim.—The process of preserving condensed milk, consisting in heating it above 212° Fahrenheit, so as to destroy any germs of fermentation, and then condensing it by evaporation, substantially as set forth.

144,311.—Condensed Milk.—GAIL BORDEN, White Plains, and JOHN G. BORDEN, South East, N. Y. Application filed October 30, 1873.

This product has the consistency of ordinary condensed milk, but, by a preliminary heating, so as to raise the temperature above 212° Fahrenheit, fermentation is prevented.

Claim.—The manufacture or product of condensed milk, rendered preservative by heating the milk under pressure to a degree

above the boiling-point, or above 212° Fahrenheit, by the process and operation, and substantially as herein set forth.

144,312.—Boot-Tree.—THOMAS BRANIGAN, Beloit, Wis. Application filed October 4, 1873.

Invention consists in the novel arrangement of well-known devices, as definitely set forth in the several clauses of claim.

Claim.—1. In a boot tree, the sliding front B, rod a^2, nut b^2, follower A, and hook i substantially as and for the purpose specified.

2. The combination of the sliding front B, foot part C and D, substantially as described.

3. The rod E, lever a^2, spring-dog o, skeleton frame G, nuts a^3, arms z z, and follower f, substantially as and for the purpose set forth.

4. The parts A, F, and S, in combination with the rod E, skeleton frame G, nuts a^3, arms z z, and follower f, substantially as specified.

144,313.—Wood-Grinder.—JAMES BRIDGE, Augusta, Me. Application filed May 10, 1873.

A stationary millstone or plate, A, is placed in a case, and over it a rotating wheel, C. Both are provided with a series of knives or bars, a a, which extend beyond the periphery of the wheel C and approach the sides of the case, leaving spaces b b open at the top, and carving an ducts, through which the circulating material, mingled with water and projected outward by centrifugal force against the side of the case, is thrown upward and, falling upon a stationary plate H, begins its circuit anew. Material is fed through a spider, E.

Claim.—The combination of the rim or vat B, stones or plates A C, having knives or blades a a extending beyond the edges and forming channels b b, the circumferential inclined bench B', and the covering-plate H, all constructed and arranged substantially as and for the purposes herein set forth.

144,314.—Magic Lantern.—ALBERT G. BURNY, Philadelphia, Pa. Application filed July 7, 1873.

A magic lantern with a lamp-chamber, having a slotted sliding cover so arranged that different kinds of lamps or burners may be used. Also a hood, partly surrounding the frame, to carry off the heat, and a picture-holder adapted to various kinds of pictures.

Claim.—1. The combination, substantially as described, of the slotted slide A with the combustion-chamber of a magic-lantern apparatus, for the purpose specified.

2. The combination, substantially as described, with a magic-lantern apparatus, of a reversible picture-holder, D, provided with an adjustable stop, j.

3. A hood, d, arranged within a magic lantern, in respect to the burner, as and for the purpose set forth.

144,315.—Medicated Pad or Belt.—ALMOND F. COOPER, Cambridge, Mass. Application filed October 2, 1873.

Claim.—As a new article of manufacture, a porous pad or belt containing a compound of alum ($Al_2O_3,3SO_3+KO,SO_3\times24HO$) and borax, ($NaO,2BO_3+10HO$,) as and for the purpose set forth.

144,316.—Machine for Cutting and Working Stone.—HERBERT COTTRELL, Newark, N. J. Application filed July 29, 1873.

The tool-carrying frame is combined with feed mechanism adapted to move said frame in any desired direction, and also a carriage provided with an upright stone-carrying plate adapted to be set nearer to or further from the tool, as desired, as well as to be turned on a vertical axis to adjust its upright face at any required angle with respect to the tool. The said supporting-plate also is provided with adjustable and detachable centers, similar to those in a turning-lathe, to be used in turning columns, and for like work.

Claim.—1. The combination, with the tool-carriage and screw-threaded shafts for feeding the same vertically and horizontally, of the tension or feed pulleys imparting rotary movement to said shafts, and constructed and operating substantially as shown and described, so that at the times and under the conditions specified the peripheral portion of one or the other of said pulleys may slip on its hub, and thus permit the rotation of the feed-shaft driven by said pulley to be retarded for the purposes stated.

2. The feed or tension pulleys, in combination with the reversing-fingers, driving-pulleys, and cones for varying the relative speed of said driving-pulleys, arranged and operating together substantially as and for the purposes shown and set forth.

3. The stone-carrying truck or car, arranged to run on a track extending in front of the cutting devices, and combined with mechanism whereby it may be locked and fixed in position on the track in front of said cutting devices, substantially as shown and described.

4. The combination, with the truck or car, of the V center rail between the track-rails and the beveled clamps carried by said truck, and cam-shaft for operating the same, substantially as herein shown and set forth.

5. The upright stone-supporting plate or frame, supported and held on the truck or car, and adjustable thereon with respect to the cutting mechanism, substantially as herein shown and set forth.

6. The truck or car and stone-supporting plate, slotted to receive a bolt or pin which holds it to the truck, permits the said plate to be adjusted bodily toward and away from the cutter, and serves also as an axis upon which the plate may be turned to set its face at any desired angle in a vertical plane with respect to the cutter, in combination with end dogs on said adjustable plate for clamping it to the truck in the desired position, substantially as shown and set forth.

7. In combination with the upright stone-supporting plate, the adjustable and removable centers for turning columns and for similar work, substantially as herein shown and set forth.

144,317.—Stone-Sawing Machine.—HERBERT COTTRELL, Newark, N. J. Application filed May 8, 1873.

Claim.—1. The above-described endless metallic running band, in combination with sections or pieces of steel placed at intervals in the edge of said band, in which sections of steel carbons are partly embedded, and present a projecting cutting surface, substantially as set forth.

2. The endless metallic running band with carbon-armed sections, in combination with upper and lower pulleys, the periphery of which is covered with a yielding or elastic substance, substantially as and for the purposes set forth.

144,318.—Stone-Cutting Tool.—HERBERT COTTRELL, Newark, N. J. Application filed August 21, 1873.

A stationary beveled disk is combined with a revolving diamond-cutter. When the cutter is fed against the stone the beveled disk breaks off that portion of the stone left outside of the kerf.

Claim.—The combination of a revolving diamond or carbon armed circular cutter and a stationary wedge or beveled disk applied to and operating in connecting with said cutter, substantially as herein before described.

144,319.—Centrifugal Machine for Draining Sugar.—PHILIPP CRAMER, Jersey City, N. J. Application filed October 7, 1873.

The sirup, charged with crystals, is received in the upper chamber of the basket, and, by centrifugal force, is delivered through the channels and ducts near the outer edge of the partition to the basket proper, where it forms an annular wall supported by a flange at the bottom of the basket, from whence it is removed by an adjustable scoop.

Claim.—1. The revolving basket of a centrifugal machine, in combination with the receiving surface chamber G and the cover F, provided with ducts for forcibly delivering the sirup and sugar in streams against the sides of the basket, substantially as described.

2. The revolving basket provided with an annular sugar-receiving shelf, H, and arranged to be accessible from below, for the ready removal of the sugar from the shelf while the machine is in motion, substantially as described.

3. The revolving basket with the annular shelf, in combination with the discharging scoop or scraper, substantially as described.

4. In combination with the base of a spindle-standard in a centrifugal machine, the elastic cushion between the base and the floor or platform, and the bolts and their elastic cushions below the floor, substantially as described.

5. The spray-pipe N, in combination with a basket having a closed top and an open bottom, substantially as described.

144,320.—Machine for Making Weavers' Harness.—JOHN H. CROWELL, Providence, R. I., assignor to himself, JOHN KENDRICK, and JOSEPH H. KENDRICK, same place. Application filed June 26, 1873.

The rocking loose-rods are provided with eccentric protuberances, which cause the heddle-twines to be longer on one side than on the other, so that the side bands to which the twines are fastened are arranged at one side of the axis of the heddle-shaft.

Claim.—The rocking loose-rods A A' of a machine for making weavers' harness, having eccentric protuberances H H' for the purpose of making the heddles longer upon one side than the other, substantially as described.

144,321.—Cultivator.—SEBERT CRUTCHER, Little Mount, Ky. Application filed September 6, 1873.

The frame consists of a center-beam and two end pieces, the forward one being arched, and the plow-beams are attached to the ends of this arch by link-joints. Branched standards are attached to the rear ends of the land-sides by a hinge-joint, and pivoted to the cross-beam above.

Claim.—The straddle-row walking-cultivator, composed of the frame C D E, and plows whose beams are at their forward ends connected by link-joints to the bar C of the frame, and whose land-side bars H' and I' are pivoted to the fixed pendent arms F and G of the bar E of the frame, substantially as and for the purpose specified.

144,322.—Meat-Press.—JACOB I. DANFORTH, Newburyport, Mass. Application filed August 23, 1873.

Any fat escaping through the joints made between the cylinder and base is confined within the space bounded by the flange, and drips through the perforated base into a pan arranged beneath the base.

Claim.—The base A, having an annular series of perforations, 10 10, in combination with the flange i, cap D, and cylinder B, as and for the purpose set forth.

144,323.—King-Bolt for Vehicles.—JOHN DEBELE, Plantsville, Conn., assignor of one-half his right to "THE ATWATER MANUFACTURING COMPANY," same place. Application filed August 25, 1873.

Claim.—The king-bolt A, B, C, and D, having its body and head loosely connected together so as to form at each point of connection a joint which is flexible in either direction, substantially as and for the purpose specified.

144,324.—Billiard-Cue Tip.—GEORGE W. DICKINSON, Saratoga Springs, N. Y. Application filed August 27, 1873.

The ordinary leather tip has an outside facing of rubber, to avoid the necessity of chalking it.

Claim.—A billiard-cue, A, having a leather tip, a, cemented to its outer end, and a tip of thin rubber, b, cemented to the outer face of the leather tip, all as and for the purposes set forth.

144,325.—Tidy-Pin.—GEORGE DOOLITTLE, Bridgeport, Conn. Application filed August 21, 1873.

A flat sheet is countersunk to receive a tongue which is hinged upon it, and which carries a curved pin that passes through an opening in the countersunk part and pierces the article underneath.

Claim.—In combination with the sheet-metal leaf A, provided with the plate a, the tongue B, and pin C, all constructed and arranged to operate substantially as and for the purpose set forth.

144,326.—Thread-Cutter for Sewing-Machines.—NOAH EVINGER, Sanford, Ind. Application filed June 17, 1873.

A knife with a thumb-piece is riveted to the under side of an elastic strap hooked to the bed-plate. The knife may be turned out and up from the bed-plate to cut the thread.

Claim.—An attachment for sewing-machines, consisting of the elastic strap provided with hooks, knife, and thumb-piece, all combined to operate together as an and for the purposes described.

144,327.—Seed-Dropper.—JOHN M. FONDEN, Springfield, Ill. Application filed July 22, 1873.

A star-wheel is acted upon by a cam-slide turning the pocket-disk, the wheel and disk being separated by a perforated plate and attached to a common shaft. A pivoted cut-off works in a recess in the plate above the pocket-disk, and is held in place by a spring.

Claim.—1. The cut-off G, pivoted in a recess on the under side of the plate E, and provided with the leg n, to be operated upon by a spring, p, as and for the purposes herein set forth.

2. The combination, with the box E, of the fixed plates C E, supported on the bottom A, and separated by the corner-posts d d, the wheels D J, arranged upon one shaft, and in the spaces above and below the plate C, and the slide H with openings x y, as shown.

144,328.—Removing Acids from Leather.—MICHAEL W. FEY, Guyandotte, W. Va. Application filed August 20, 1873.

Claim.—The process of removing acid from previously-tanned hides by immersing them in a solution of salt and bicarbonate of soda, in the manner described.

144,329.—Middlings-Purifier.—CLARK S. FULLER, Oswego, N. Y. Application filed October 20, 1873.

Middlings, after being subjected to a scouring or beating action between a rotating brush and concave, are thrown out into an exhaust-chamber, in which the fibrous particles and other light impurities are separated and carried off by the air-currents, while the heavier granules or good middlings descend by gravity into discharge-hopper at bottom of chamber.

Claim.—1. The combination of the brush B and concave C with an exhaust-chamber, through which the middlings are thrown by the brush, substantially as and for the purposes set forth.

2. The combination and arrangement in an exhaust-chamber, and with the beater and concave B C, of the beater and concave L M, substantially as and for the purpose hereinbefore set forth.

144,330.—Ore-Pulverizer.—SMITH GARDNER, New York, N. Y. Application filed October 30, 1873.

One shell of the mill, and also the beaters, is lined and covered with burr-stone, so as to prevent any particles of iron from wearing off and mixing with the quartz or other material which is pulverized.

Claim.—1. A case or shell lined with burr-stone or other hard mineral substance, substantially such as described.

2. Beaters faced with burr-stone, glass, porcelain, or other like material.

3. The adjustable arms and beaters described.

4. The method described of facing the beaters, by means of dovetail and bevel, so as to hold the facings when the machine is moving.

5. The combination of the lined case or shell a and c, the adjustable arms and beaters i i and k k, the adjustable openings o o, and discharge-opening q, all combined and arranged substantially as described.

144,331.—Combined Condenser and Feed-Water Apparatus.—JEREMIAH S. GIBSON, Martinsburg, W. Va. Application filed October 17, 1873.

The pump and injector are connected with the tender by suitable pipes, which pass through the spirals and connect with the perforated pipe in the steam-space of the boiler. For the purpose of preventing priming, cold water is injected by the injectors, the connection to the pump being closed.

Claim.—1. The pipe C, having its front end passing through the smoke-arch and connected with the perforated pipe E in the boiler, in combination with the pump C and supply-pipe D, substantially as and for the purposes described.

2. The combination of the injector H and pipes F, G, and H with the perforated pipe E, arranged in a boiler, as and for the purpose herein set forth.

3. The combination of the pump C and its pipes with the perforated pipe E and the injector E, with its pipes, arranged substantially as shown, and for the purposes herein set forth.

144,332.—Railroad-Chair.—DAVID M. GRAHAM, Evansville, Ind. Application filed September 16, 1873.

The chair A embraced the web and boot of the rail, and the two sections interlock under the rail, and are held in place by means of flat keys passing through them and through corresponding slots in the ends of the rails.

Claim.—The chair or joint-supporter provided with apertures b and beveled parts c, in combination with keys C and D, and slots e in the ends of the rails, substantially as and for the purpose set forth.

144,333.—Hemmer for Sewing-Machines.—JOHN M. GRIMES, Delavan, Ill. Application filed July 7, 1873.

The jointed supporting-arms allow movement of the gage-plate toward or from the scroll for hems of different widths.

Claim.—1. The extensible jointed supporting-arms C and D between the plates E e^2, and connected to them, as and for the purposes set forth.

2. The adjustable sewing-machine hemmer, having the stationary longitudinally-slotted plate A^2 with an index-mark a^2, thereon, the cloth-turner B with the turning-tongues b', the movable gage-plate E, tongue F, and the extensible jointed arms C and D, substantially as shown and specified.

144,334.—Waistband-Fastening for Pantaloons, &c.—JOHN A. HAARVIG, Chicago, Ill. Application filed July 12, 1873.

Claim.—The combination, with the recessed plate C, having the hems c, of the hook-plate D, having the aperture r in the tongue, and the spring-finger v, arranged to press the hems c into the aperture r, substantially as specified.

144,335.—Flat-Iron Heater.—JOHN F. HALL, Albia, Iowa. Application filed October 11, 1873.

The heater has a removable bottom. When it is removed, the iron is supported by its handle, which rests upon the edges of the slot in the cover.

Claim.—1. The removable bottom C, when used in connection with a sad-iron heater, substantially as set forth.

2. The combination, in a sad-iron heater, of the plate A, slotted swinging cover A', chamber B, and removable bottom C, the parts being arranged substantially as and for the purpose set forth.

144,336.—Wash-Boiler.—ROBERT J. HARRISON, Raleigh, N. C., assignor of one-half his right to JAMES Q. WILLIAMS, same place. Application filed August 11, 1873.

The boiler is provided with a continuous interior flange provided with an inclined seat to support the false bottom. Curved ribs are attached transversely to the inside of the cover to keep the clothes clear of the upper passages for the circulating water. A reversible wire frame is employed to retain the clothes on the false bottom or to elevate them near the top.

Claim.—1. The boiler A, having the continuous horizontal interior flange F, the latter provided with inclined seats f, in combination with the false bottom G, having the upturned inclined rim or flange g, substantially as and for the purpose specified.

2. In combination with the boiler A, having the end passages E, the cover A, having the transverse curved ribs U, substantially as and for the purpose specified.

3. The concave valve S, resting over the orifice E, and provided with depending bent lugs T, in combination with the cover B, substantially as and for the purpose specified.

4. The frame V, provided with the projecting portion W, and adapted to confine the fabrics on the bottom of the boiler, or elevate the same above the bottom, substantially as described.

144,337.—Combined Lead-Pencil and Rubber Eraser.—JOSEPH ILLFELDER, New York, N. Y. Application filed August 26, 1873.

Claim.—The combination of a conical lead-pencil, a rubber eraser, attached to the head of said pencil, and a conical supporting-sleeve, loose on the pencil, and removable therefrom, but held in position, when pushed up to encircle and surround the rubber eraser, by being wedged or jammed onto the enlarged part of the pencil, substantially as shown and described.

144,338.—Spring Bed-Bottom.—JOSHUA S. JUDSON, Austin, Minn. Application filed September 13, 1873.

The bottom is in two independent sections, and is hung at the ends to the bedstead by hooks and elastic rings.

Claim.—The sectional bed-bottom B, end pieces b, elastic springs D, hooks b', and eyes c and frame C, when the several parts are constructed and adapted to operate in the manner set forth.

144,339.—Trestle for Painting Gensk-Shelves, &c.—WILLIAM M. KNAPP, Muncie, Ind. Application filed April 19, 1873.

The legs of the trestle are connected at their upper ends by a casting having sockets on its under side for the reception of the legs, and a suitable distance above the lower ends of the legs is a platform supported by rods, which connect and brace the legs. The table rests upon a revolving shaft, which passes through the center of the casting, and bears in a cup within a cross-brace

above the platform. A cross-bar provided with guide-rods is placed at one end of the table, and is elevated or depressed by a crank-screw. Two of the legs are provided with wheels, and on one of the other two is a casting, to which is attached a handle for moving the truss.

Claim.—1. The arrangement of the legs A A, casting B with sockets *a a* and collar *b*, the platform C, and rods *d d*, substantially as and for the purposes herein set forth.

2. In combination with the trestle A B C, the wheels J, casting K having steps *h h*, and the handle L, all constructed and arranged substantially as and for the purposes herein set forth.

3. The cross-bar H, with guide-rods *f f* and crank-screw I, arranged on the table of a painter's trestle, substantially as and for the purposes herein set forth.

4. The revolving table G with shaft E, in combination with the trestle A B C, all constructed and arranged substantially as and for the purposes herein set forth.

144,340.—Manufacture of Traveling-Bags.—JOHN W. LEE, Newark, N. J. Application filed July 3, 1873.

The material for the hem or pocket and that for the bag are sewed together by machine, and the metal jaws are afterward inserted and hinged together. The hem may also be made on the part which forms the bag proper, and the jaws inserted in the same manner.

Claim.—1. The herein-described mode of attaching the body of the bag to the frame or jaws—that is to say, by first forming a hem or pocket along the edge of the mouth, and then inserting the jaws separately into said hem or pocket, and finally hinging the jaws together, as herein set forth.

2. The hem or pocket made from a separate piece, and secured to the body and the lining by one or more rows of stitches, the same being prepared, as described, previous to the insertion of the jaws, substantially as set forth.

144,341.—Pattern for Cutting the Uppers of Shoes.—GEORGE LEINROTH, Philadelphia, Pa. Application filed July 7, 1873.

A pattern having three sets of size-graduations marked upon it is used to form an auxiliary pattern of the desired size and shape.

Claim.—The pattern A, with the "size"-graduations B, "instep"-graduations C, and auxiliary graduations D, adapted for operation with the pattern E, substantially in the manner and for the purpose set forth.

144,342.—Curtain-Fixture.—HENRY E. MARCHAND, Pittsburg, Pa. Application filed April 4, 1873.

Vertical rollers are arranged each side of the window to receive the curtains that are drawn horizontally across the window. The two curtains are connected together by suitable fastenings on their ends. When the curtains are released from their fastenings, they are wound up by elastic cords which are attached to the grooved sheaves on the ends of the rollers.

Claim.—In a curtain-fixture, the rollers B C, each provided with a curtain having fastening devices G G, in combination with an operating-spring, L, for closing the curtains, the whole constructed and arranged substantially as described, and adapted to be arranged vertically upon the side of the window, as set forth.

144,343.—Milk-Cooler.—EDMOND MARTIN, Potsdam, N. Y. Application filed March 27, 1873.

A crank-screw is placed at the end of the pan for elevating the same. A tube, having at one end branch tubes perforated on their under sides, conveys water into the vat. The pan is set on blocks in the bottom of the vat.

Claim.—1. The milk-pan B, provided at one end with screw E, substantially as and for the purposes herein set forth.

2. The combination of the vat A with blocks D D and pipes G H, the pan B with screw E, tubes *a d*, and rubber sleeve *d*, all constructed and arranged substantially as and for the purposes herein set forth.

144,344.—Saw.—ERNEST MAEX, New York, N. Y. Application filed April 25, 1873.

The teeth are formed of hard steel blades, secured in a frame to which the handles are attached, the teeth being removed from the frame for sharpening, when necessary.

Claim.—1. A saw composed of a series of blades, B, secured together in a clamp, A, substantially as shown and described.

2. The sleeves C, provided in their ends with notches *c*, in combination with the clamp A, blades B, and handles D, substantially as shown and described.

144,345.—Blow-Pipe.—JOHN E. MCCLURE, San Francisco, and DANFORTH H. AINSWORTH, Salinas, Cal. Application filed August 30, 1873.

The blow-pipe has two chambers connected by a narrow passage. The lower chamber contains the liquid. The upper one receives the vapor and discharges it through the ejector.

Claim.—A blow-pipe consisting of two connected chambers, a *b*, having the front convexities *b'* and the intermediate air-space *c'*, the ejector E being located on the upper, and the flame impinging upon the lower, of said convexities, as and for the purpose specified.

144,346.—Cultivator.—ALLAN S. MCDONELL, Orgeode township, Canada. Application filed June 10, 1873.

Forked tongue hung to centrally-pivoted frame near the axle or center. Toothed cylinder and fixed meshing-teeth in rear, worked by endless chain from wheel geared to central wheel on axle. Adjustable seat, and center-wheel for regulating depth of cultivation.

Claim.—1. A cultivator having its frame A mounted centrally on two wheels, with an adjustable center-wheel, H, supporting its rear end, and having the rotating toothed cylinder J suspended in bearings from the rear end of said frame, in combination with the fixed teeth, all constructed and arranged to operate substantially as described.

2. In combination with the frame A having the cylinder J and teeth arranged to operate as described, the adjustable seat V, and the tongue hinged to the frame at or near its center, whereby more or less weight can be applied to the cylinder, and the frame with its attachments be left free to follow the undulations of the surface, as set forth.

144,347.—Car-Axle.—GEORGE W. MELTMORE, Janesville, Wis. Application filed October 6, 1873.

To adapt car-trucks to tracks of different gages.

Claim.—In combination with the sleeve A and bearing-block G, the collar C, constructed to operate substantially as and for the purpose set forth.

144,348.—Evener for Wool-Cards.—CHARLES F. MORRISON, Thompsonville, Conn., assignor to himself, JAMES MORRISON, GEO. S. HARWOOD, and GEORGE H. QUINCY. Application filed April 26, 1873.

For operating upon the roping delivered from the side of the doffer of a wool-card. Two pair of rolls belted together so as to run at the same speed, have between them a movable trumpet, which, when the roping runs too thick or too thin, sets in motion mechanism to increase or decrease the speed of the rolls, so as to take material faster or slower from the doffer.

Claim.—In side-drawing or roping machines for wool-carding engines, the combination, with drawing and delivery rolls revolving at the same rate of speed, of automatic evening mechanism brought into operation by variations in the size of the sliver, to increase or decrease, as the case may be, the speed of both sets of rolls simultaneously and in unison, substantially as and for the purposes shown and set forth.

144,349.—Chair.—JACOB MORRISON and HENRY M. HUTCHINSON, Philadelphia, Pa. Application filed September 20, 1873.

The seat-frame is connected to the spring-bearing frame by a hinge. Each section of said hinge is formed of a base having side pieces or lugs through which the swivel-pin passes. The elliptical spring has end-bearings in the extensions of the lower section of the hinge, and its arch presses against the base of the upper section of the hinge. To one of the extensions of the lower hinge is secured an inclined plane, between which and the spring is arranged a block which is pressed forward by a screw, so as to increase or decrease the tension of the spring.

Claim.—1. In combination with the hinge D, the elliptical spring E, said spring having end bearings in the extensions of the lower section D^2 of the hinge, its center or bow pressing against the base of the upper section of the hinge, substantially as set forth.

2. In combination with the hinge D and spring E, the movable block F and inclined plane D^3, substantially as and for the purpose specified.

144,350.—Elevator for Buildings, &c.—GAORG MÜLLER, New York, N. Y. Application filed March 17, 1873.

An eccentric-lever is attached to the cross-head of the car and connected with rods, which operate safety-pawls engaging with teeth on a rack-bar, to stop the descent of the car.

Claim.—The spring-pawls *h h*, rods *h h*, cross-heads *f*, and eccentric-lever *i*, attached to the car, in combination with the racks G *a*, arranged so that the operator may govern the downward movement of the car at any point by the lever, all arranged to operate as and for the purpose specified.

144,351.—Car-Brake.—WILLIAM HAYLOR, Mildmay Park, England. Application filed July 16, 1871.

Claim.—1. The combination of the chain G extending beneath a series of cars and brake-shoes S, levers H H D P P^1 P^{2}, beam C, and springs M, arranged upon each car so as to be operated, as set forth.

2. The combination, with the braking-lever D, of the trigger *i* and its movable weight *i'*, to operate as set forth.

144,352.—Cannula-Point for Syringes.—EDWARD B. NIMMO, Brooklyn, N. Y., assignor to SHEPARD & DUDLEY, New York city. Application filed October 24, 1873.

The points of a hypodermic syringe are made of an alloy of aluminum and copper.

Claim.—A cannulated point or needle for syringes made of an alloy of aluminum and copper, substantially as herein specified.

144,353.—Shaft-Hanger.—REINHARD R. ONTON and WILLIAM CAVERT, Sterling, Ill. Application filed October 3, 1873.

Claim.—1. The combination, with the beam B, of the top bar of the hanger-frame A, provided with slots *b* and ears *c*, the bolts and nuts *c d*, and set-screws C, for adjusting the hanger-frame longitudinally, and at the same time locking the nuts on the bolts which secure the frame to the beam, all substantially as herein set forth.

2. The combination, with the pivoted yoke D and pivoted shaft-bearing E, of the detachable drip cups G G, provided with ears *m m*, and connected to the yoke D by means of pins *i*, for receiving the drippings from the shaft-bearing irrespective of the position in which the shaft is placed, substantially as herein set forth.

144,354.—Wood-Grinder for Paper-Pulp.—MARVIN S. OTIS and MARVIN E. OTIS, Rochester, N. Y. Application filed October 18, 1873.

Two conical grinding-stones are mounted in a box upon parallel shafts, and in such proximity to each other that they will touch at their major diameters, while at their minor diameters the widest part of a recess is formed. Into this recess a wedge-shaped rest passes, upon which the wood to be ground is supported. Said rest also extends back-ward from the recess and forms the bottom of a box or channel through which the wood is fed by corrugated feed-rollers located in it. The upper roller is yielding; the lower one, which protrudes through the bottom of the channel, is fixed upon a sleeve having a flange upon one end and a loose pulley just beyond it. Through the sleeve a shaft passes, which also has a flange, and this just beyond the loose pulley. Upon the other end of the shaft is a hand-wheel, by turning which the flange of the shaft may be drawn toward or moved from the loose pulley and flange of the sleeve. The loose pulley serves to separate the flanges. A small wheel below gives motion to the pulley by belt or by direct gear, and thus to the shaft and sleeve, when their respective flanges are brought to bear against this pulley by means of the hand-wheel. The whole constitutes a variable feed.

Claim.—1. The two conical grinding-stones A on shafts *a*, revolving over toward each other, in combination with the wedge-shaped rest B, upon which the wood is fed to the grinders, substantially as described.

2. In combination with the rest B, which forms the bottom of the box or channel B", and which rest is wedge-shaped at its end extending between the grinders, the fluted vertically-yielding feed-roller *e* and stationary feed-roller *e'*, substantially as and for the purpose described.

3. The sleeve C, having the flange *b'*, and carrying the loose friction-wheel F, in combination with the shaft *c* and its flange *b*, and hand-wheel I, constituting a variable feeding device, substantially as described.

4. The two conical grinding-stones A, each provided with curved furrows H, running longitudinally upon its periphery, said furrows being curved for the purpose of grasping and drawing in the wood, and giving it a shearing cut diagonally across its fiber, substantially as described.

5. In combination with the conical grinders A, the troughs D', fixed by one edge to the inside of the cover D, for the purpose of catching and conveying to the sides of the stones such ground wood as may have been thrown up by them, thus preventing any regrinding, substantially as set forth.

144,355.—Hot-Air Furnace.—ANTHONY PFUND, New York, N. Y. Application filed October 2, 1873.

Three bonnets are placed over a furnace. Between the first and second is a smoke-chamber, and between the second and third a hot-air chamber. Outside of the third bonnet is an air-chamber communicating with the open air. Cool air can thus be admitted without roasting upon the fire and heated gases.

Claim.—The combination in a furnace of the bonnets D E F, smoke and air chambers *d*, fire-chamber B, ash-chamber C, case or wall A, and a controlling damper or valve, substantially as herein shown and described, for the purpose specified.

144,356.—Valve for Water-Pipes.—D. GOFFE PHIPPS, New Haven, Conn. Application filed August 27, 1873.

Claim.—The herein-described valve for water-pipes, consisting of the valve-chamber proper and the valve working therein, the said chamber formed with projections or necks C concentric with the valve-seats, and the interior of the necks, from the valve-seats outward, lined with cement, substantially as described.

144,357.—Device for Retaining Fire in Stoves.—EDWARD Y. ROBBINS, Cincinnati, Ohio. Application filed September 18, 1873.

The tile or cover may be operated by either a fixed or a detachable rod.

Claim.—The fire-cover G, composed of a piece or pieces of non-conducting material, strengthened by the rod H, and provided with the metallic frame *g* and eye J, said cover being adapted to rest on the surface of the fire, in combination with the oven-plate D of a cooking range or stove, all as herein set forth, for the purpose specified.

144,358.—Vacuum-Pan for the Manufacture of Sugar, &c.—JOHN B. ROOT, New York, N. Y. Application filed March 10, 1873.

Vapor from the vacuum-pan is carried down into the heating-jacket and coil by the steam-jet, which acts as an exhaust object to utilize the heat of the vapor.

Claim.—The combination, with an evaporating-vessel, of a system of vapor and steam pipes and continuous coils, substantially as herein described, whereby the vapor of the evaporating liquid shall be forced into the steam-heating coil or jacket applied to the same vessel, or their equivalent, by a jet of high-pressure steam, substantially as and for the purpose herein set forth.

144,359.—Carpenter's Gage.—ELIAS SAHM, Greenville, Pa. Application filed April 22, 1873.

A gage-bar has two scriber-points, one of which is adjustable, and an adjustable graduated cross-arm. The arm is for locating, and the points for marking out, mortises.

Claim.—The graduated arm A, in combination with the points 1 and 2 and the sliding rod B, the head F, and the graduated arm E, constructed as described, for the purposes set forth.

144,360.—Cattle-Stanchion.—CALVIN W. SAWDEY, Pecksville, N. Y. Application filed July 26, 1873.

The stanchion, swinging from a shaft on top, has stops below to limit its movements from front to rear of a trough. The front of this trough is hinged, and may be let down on the plane of the bottom of the trough.

Claim.—The cattle-stanchion, having the standards A, feed-box B, forward swinging stanchions or frame, the fixed edge-bar G, and the hinged rear door K, substantially as specified.

144,361.—Fire-Escape.—DANIEL A. SCOTT and ARTHUR W. HEITZ, Calais, Me., assignors to PATRICK CURRAN and EDWARD CURRAN, Milltown, New Brunswick, and MARIA LOUISA WHITNEY and ARTHUR W. HEITZ, Calais, Me. Application filed June 23, 1873.

The safety-belt is attached to the person making the descent, and the endless rope, which passes through the pulley-block attached to the building, is passed around the projecting pin A by the person descending, to afford the requisite friction.

Claim.—The within-described fire-escape, consisting of the block A, endless rope B, safety-belt C, and rendering-pin D having the shank *h*, all constructed and arranged substantially as and for the purposes herein set forth.

144,362.—Spring Cushion, Mattress, &c.—DAVID M. SELLEG, Newberg, N. Y. Application filed September 23, 1873.

Spiral springs are secured at both ends within a casing of burlaps. Hair or moss is inserted between the springs, and around the whole is a cushion of hair or moss.

Claim.—The casing B, in which the springs S and hair, moss, or other material are placed, and which sags down between the rows of springs, in combination with the outer inclosing covering or casing F, the parts being constructed, arranged, and combined substantially as shown and described.

144,363.—Turbine Water-Wheel.—ISAAC SHERCK, Fremont, Ohio. Application filed April 25, 1873.

The sluice is so formed that its inner wall adjacent to the wheel rests so closely against the latter as to be nearly tangent to it, while its exterior walls extend forward, but passing beyond the point of juncture of the inner wall, thus forming a guide to direct the water from the sluice against the buckets, at the same time acting as a fender to hold it there until it has expended its momentum, after which it is discharged at the side of the wheel.

Claim.—1. The sluice G, triangular in horizontal section, provided with the sliding gate H against its inner wall, and the inclined cheek-plates I at its delivery-port, in combination with the wheel F, vertically serrated at its periphery, as described, and so arranged, relatively to the latter and the other sluices G, that water will be delivered at the side immediately after and in line with the impact, substantially as set forth and shown.

2. In combination with the sluice G, the cheek-plates I, inclined upward in the direction of the current, as and for the purpose substantially as described.

3. The arrangement of the sluices G, with their fender-plates *g'*, relatively to the wheel F and to each other, so that immediately after the water has delivered its impact, it is discharged at the side in continuation of the line of its impact, substantially as set forth and shown.

144,364.—Rubber Eraser.—GREENLEAF STACKPOLE, Elizabeth, N. J. Application filed April 25, 1873.

A circular block of rubber is hung on a spindle in a semi-circular case, which in turn is pivoted in a similar case. The rubber may be turned to present a new surface, and its holder rotated so as to wholly incase it.

Claim.—The shells A and B, when provided with the rubber C, the whole being held together by the rivet D, substantially as and for the purpose set forth.

144,365.—Washing-Machine.—MOSES W. STAPLES, Richmond, Va. Application filed September 11, 1873.

A water-tank has a semi-cylindrical base, on which are inclined ribs. Above these is a hollow revolving cylinder, having overlapping slats arranged obliquely on its surface, with a door for admitting the clothes to be washed.

Claim.—The combination, in a washing-machine, of a hollow revolving cylinder, B, consisting of overlapping slats *a* and inclined ribs or flanges *b*, arranged within the outer casing, as specified.

144,366.—Treadle for Sewing-Machines.—WILLIAM H. STEWART, Brooklyn, N. Y., assignor to himself and ALFRED ROBINSON, Morristown, N. J. Application filed April 26, 1873.

The treadle is adjustable vertically by means of sliding pivots, which are arranged in the sides of the frame, and horizontally by means of sliding foot-pieces arranged upon the treadle-yoke in such manner as to bring the axis of motion on a line with the axis of the ankles.

Claim.—1. The treadle-yoke *f*, suspended by the links *d* and swinging upon the pivot-pins *i* that are adjustable vertically in the slots of the yoke and frame *a*, substantially as and for the purposes set forth.

2. The foot-piece *g*, adjustable horizontally upon the treadle-yoke *f*, in combination with the adjustable pivots and treadle, substantially as and for the purposes set forth.

3. The arm *m* and adjustable connection for the pitman to the sewing-machine crank, in combination with the swinging sewing-machine treadle-yoke and the foot-piece, substantially as set forth.

144,367.—Harvester.—CULVIN S. STONE, Indianapolis, Ind. Application filed July 29, 1873.

The rake-head is journaled on a sliding bar, which is made to reciprocate by means of levers connecting it to a belt moving around pulleys at the rear corners of the slotted platform. The teeth are locked in an elevated position for raking by a spring-catch, which is automatically released at the inner end of the platform, when a spring on the rake-head restores the teeth to a horizontal position beneath the slats.

Claim.—The self-raking mechanism consisting of the platform provided with the projections *b* and *i*, the chain-band rotating on pulleys, the rod *w*, the toggle-joint *r*, the sleeve *v*, the rake-bar *t* provided with bearings *u*, the rake T, the spring-catch *z*, and the spring *x*, all combined and working together as described.

144,368.—Last-Block Fastener.—NELSON B. STREETER, Groton, N. Y. Application filed October 31, 1872.

Claim.—The last-block *b*, with a recess, *d*, and the pivoted latch *g*, having an enlarged head or projection, in combination with the last *a*, having an opening in its top to received the head of the latch, substantially as shown and described.

144,369.—Process of Extracting Sugar from Molasses.—JOHN B. THOMS, Baltimore, Md., assignor of one-half to SAMUEL ECCLES, Jr., same place. Application filed June 11, 1873.

Boils the molasses in a vacuum down to "proof" or to a less degree of concentration, then storing the product for any period not less than a month, and completing the operation by treating the concentrated product for the separation of sugar in a centrifugal or other apparatus.

Claim.—The described process for arresting and preventing the deterioration of the sugar-making properties of molasses, for increasing the percentage of sugar product, and for prolonging the sugar-making season, or rendering the extraction of sugar from molasses a continuous operation, at the will of the manufacturer, through all seasons of the year, substantially as set forth.

144,370.—Seal-Belt.—JAMES R. THOMSON, Buffalo, N. Y.—Case B. Application filed April 22, 1873.

Claim.—The beaded belt-piece A, having a seal-opening, *a'*, in combination with the bar B, having a portion bent at right angles, and a seal-opening, *a'*, substantially as and for the purpose set forth.

144,371.—Hame.—JAMES THORNTON, Wellsville, and EMMIT G. LATTA, Friendship, N. Y. Application filed October 2, 1873.

Claim.—1. The strap corrugated and applied to the hame so as to prevent exterior and interior corrugations for the loop, strap, or clevis-bolt, substantially as and for the purpose hereinbefore set forth.

2. The combination, with a hame and loop, *c*, of a corrugated strap or plate which has the outer or extreme corrugation *e* projecting beyond the intermediate ones so as to form stops for the loop, substantially as hereinbefore set forth.

144,372.—Grate-Bar.—PHILIP UMHOLTZ, Tremont, Pa., assignor of one-half his right to AUGUSTUS UMHOLTZ, same place. Application filed September 16, 1873.

The upper surface of the cross-bars is an inch or more above the web of the bar, to protect it from heat. The cross-bars are free ended to permit expansion, grooved in top to hold ashes, and set obliquely to prevent the scrapers from removing said ashes or being caught between them.

Claim.—1. The combination of the longitudinal bearing-bar A and the cross-bars B, whether grooved or flat-topped, arranged diagonally across said bar A, and projecting above the same, substantially as shown and described.

2. The combination of the cross-bars B, with longitudinal grooves in their top sides, and having their ends free, and the longitudinal bearing-bar A, substantially as shown and described, for the purposes set forth.

3. The combination of the cross-bars B, having longitudinal grooves in their top surfaces, and projecting above the bearing-bar A, with that bearing-bar, substantially in the manner and for the purposes shown and described.

144,373.—Manufacture of Dolls.—ISAIAH F. WALKER, Central Falls, R. I. Application filed June 28, 1873.

A secondary stuffing is introduced, being applied just before the outer skin is laid on, in order to prevent the painted surface from cracking from accidents and violence.

Claim.—In the manufacture of dolls, the combination, with the external webbing, the internal cloth forms, and the inner packing, of the secondary or outer stuffing between said forms and said external webbing, substantially as specified.

144,374.—Machine for Tapping Gas and Water Fittings.—CALEB C. WALWORTH, Boston, Mass. Application filed March 15, 1873.

The fittings are clamped in the jaws of the vise, which is pivoted on a slide, and thrown back after the thread is cut, and the tap withdrawn by a scroll-cam acting on a lever that revolves a shaft, to which the slide is connected by a link. The movement of the taps is changed by means of two loose belt-pulleys revolving in opposite directions, which are made to revolve the shaft, alternately, by a friction-pulley sliding on the driving-shaft.

Claim.—1. The combination of the series of nuts *a*, screws *d*, gears *g h*, shafts *i i*, gears *h l*, and pulley-shafts *m*, substantially as shown and described.

2. In combination with the leading-screws *d* and the gears *g h h l*, shafts *i*, and pulley-shafts *m*, the sliding clutch-pulleys *s t* and loose belt-pulleys *q r*, arranged substantially as shown and described.

3. In combination with the shaft *p*, loose belt-pulleys *q r*, and sliding clutch-pulleys *s t*, the cross-shaft *u*, shipper-forks *v*, collar *x*, and arm w^2, for automatically effecting the slide movement of the pulleys.

4. The combination of box o^2, spring p^2, collars q^2 r^2, stops or screws s^2 s^3, collar *x* with its shoulders *y z* and arm w^2, shaft *p*, and pawls o^2 b^2, arranged and operating, substantially as described, for changing the shipper-lever.

5. The combination of cam v^2, lever q^2, shaft u^2, link l^2, and pulleys o^2 s^2, arranged substantially as shown and described.

6. The vise mounted, as shown and described, on the slide v^2, and operating in the manner set forth.

7. The combination, with the head d^2 and screws c^2 j^2, of the washer-plate g^2, slot i^2, handle f^2, and pin z^2, substantially as described.

144,375.—Die for Forging Offsets or Stay-Ends for Carriages.—DARIUS WILCOX, Birmingham, Conn. Application filed October 22, 1873.

Claim.—The dies herein described, constructed and operating substantially as specified, for forging offsets or stay-ends for carriages, in the manner set forth.

144,376.—Fruit-Basket.—WILLIAM R. WILCOX, St. Joseph, Mich., assignor to himself and A. W. WELLS & CO., same place. Application filed October 4, 1873.

Springing from the top of the basket are two curved supports or protectors, which cross each other in right angles, and are secured to the basket by wires.

Claim.—The supports *b b'*, constructed and arranged as described, in combination with a fruit-basket or box, and secured thereto by wires *c c*, substantially as set forth.

144,377.—Snow-Plow for Railroads.—CHARLES L. WOOD, Calais, Me. Application filed March 21, 1873.

The snow is lifted in sections, and, after being carried up the inclined flues, is discharged at the sides of the plow, the exits of all the flues being on the same horizontal line. The plow is to be heated by steam.

Claim.—In a snow-plow, the combination of the hollow sides, top, and bottom with the hollow partitions B and C C, the partitions forming flues which have their exits on the same horizontal line, substantially as and for the purpose set forth.

144,378.—Steam-Boiler.—JAMES R. WORSWICK and EDWARD LEWIS, Cleveland, Ohio. Application filed August 6, 1873.

The rear end of the return-flue boiler is provided with a bonnet arranged with water-ways connected to the steam and water spaces in the boiler by means of pipes, for the purpose of producing a more perfect circulation, and thereby increasing the steaming capacity of said boiler.

Claim.—1. As a means for inclosing the rear end of a return-flue boiler, a bonnet or head provided with water-ways, which are connected with the upper and lower portions of the boiler, substantially as and for the purpose specified.

2. In combination with the boiler A, constructed as described, the bonnet K and pipes M, N, and O, when arranged to operate in the manner and for the purpose substantially as shown.

REISSUE PATENTS.

5,639.—Snap-Hook.—CHARLES B. BENTON, New Haven, Conn.—Patent No. 55,650, dated May 29, 1866. Application filed September 24, 1873.

Claim.—The hook A and eye B, constructed with the single cheek *c*, combined with the latch *e*, constructed with a corresponding cheek, *f*, the two said cheeks forming two sides of a chamber, *a*, within which the spring is placed to hold the latch in closed position, substantially as set forth.

5,640.—Steam Vacuum-Pump.—WILLIAM BURDON, Brooklyn, N. Y.—Patent No. 135,301, dated January 28, 1873. Application filed September 13, 1873.

Claim.—1. A steam-engine, a steam vacuum-pump, and a water-wheel, so combined that the exhaust steam from the engine is used to operate the pump, and the latter is made to supply the water-wheel with water, whereby the exhaust steam is converted into an auxiliary to the engine, substantially as and for the purpose set forth.

2. Two or more steam vacuum-pumps attached to the exhaust-pipe of a steam-engine, said pumps having steam-inlet valves, in combination with a valve-operating shaft, and with mechanism for reducing the speed of said shaft, the various parts being so arranged that one vacuum-chamber will always be open to receive the exhaust steam from the engine, substantially as described.

5,641.—Steam Vacuum-Pump.—WILLIAM BURDON, Brooklyn, N. Y.—Patent No. 141,540, dated August 5, 1873. Application filed September 11, 1873.

Two or more vacuum-pumps are arranged upon a single longitudinal pipe connected by a suction-pipe which receives its water at one end from the reservoir, and are each provided with a steam-inlet valve, the lever of which is operated by wipers upon the revolving shaft. Said valves are assisted in their descent by means of springs.

Claim.—1. Two or more steam vacuum-pumps, each having a steam-inlet valve, in combination with the exhaust-pipe of a steam-engine and a revolving shaft provided with wipers, so arranged that the steam-inlet valves are opened in regular succession, as and for the purpose described.

2. Two or more steam vacuum-pumps, each having a steam-inlet valve, in combination with a revolving shaft, in which wipers are fixed for operating the steam-inlet valves, substantially as described.

3. The combination of the operating-shaft, the wiper, and the valve-lever, substantially as described.

4. The combination of the operating-shaft, the wiper, the valve-lever, and the spring operating the valve-lever, substantially as described.

5. A suction-pipe arranged horizontally, and receiving its water at one end, in combination with two or more steam vacuum-pumps, provided with steam-inlet valves and a valve-operating shaft, the various parts arranged to prevent the water-hammer, substantially as described.

5,642.—Mechanism for Shearing Caps.—RICHARD COOKE, New Hartford, N. Y., and THOMAS HANFORD, Norwich, Conn. Patent No. 119,449, dated October 3, 1871.—Division A. Application filed April 19, 1873.

The cap to be sheared is fitted to the block, which is adjustable with reference to the rotary shearer so as to present the cap to its knives or blades. The block is turned by hand as desired.

Claim.—The shearer N and leger-knife T, in combination with the movable cap-supporting block E, as and for the purposes described.

5,643.—Apparatus for Rendering Fats and Deodorizing the Gases.—HENRY S. FIRMAN, New York, N. Y.—Patent No. 136,827, dated March 18, 1873. Application filed October 14, 1873.

The digester is provided with a central hot cylinder, which receives air from a heating-chamber placed over the furnace. Fresh air is admitted to the forward part of the heating-chamber. The products of combustion are deflected and caused to pass around the chamber by a downwardly-projecting curtain. The foul gases, after leaving the condenser, enter the furnace through a perforated pipe.

Claim.—1. In combination with a steam rendering-tank, the internal hot-air drum or chamber, and the independent means for heating it and regulating its temperature, substantially as described.

2. The combination of the centrally-located drum J, the connecting-pipe K, having a suitable regulating device, and the independent furnace L, as described.

3. The hot-air chamber or drum inside of a rendering apparatus, having a tube passing from the furnace into the lower end of said chamber or drum, and a pipe passing from the top of said hot-air chamber or drum into the stack or chimney, for the purpose of creating a circulation of air through the hot-air chamber or drum, substantially as described.

4. The moldings or projections, or their equivalents, adapted to check the gases at the instant of their delivery into the fire, to aid and facilitate their combustion, as herein shown and described.

5. The arch or upper portion of the furnace formed with one or more downward or downwardly-inclined projections, Q Q, substantially as and for the purpose set forth.

6. The outlet-pipe *r*, located at or near the top of the heated-air drum, and connecting the same to the chimney or stack, as described.

7. The employment of the radiated heat from an inclosing jacket heated by steam, in combination with the radiated heat from an internal hot-air chamber, substantially as described.

8. In combination with the furnace L and heating-chamber O, the hot-air flue X for conveying the heated air and gaseous products of the furnace L, as and for the purpose set forth.

9. The retort or delivery pipe P, either perforated or close, arranged along the top and center of the furnace L, as and for the purpose set forth.

10. Mixing hot air from the drum J with the vapors and gases evolved in the rendering-tank before burning in the furnace, as set forth.

11. The shield or curtain B, in combination with the furnace L and heating-chamber O, for checking the flames and heated products until perfect combustion has occurred, substantially as set forth.

12. The arrangement of the pipe U for withdrawing air from the heating-chamber O, and mingling it with the condensed vapors and gases before burning the same, substantially as set forth.

13. The use of charcoal, or its equivalent, in the retort, as a deodorizer of the noxious gases and vapors from a rendering apparatus, as described.

5,644.—Step-Cover and Wheel-Fender for Carriages.—JOHN W. GOSLING, Cincinnati, Ohio.—Patent No. 62,404, dated February 26, 1867. Application filed June 24, 1873.

Claim.—1. In combination with the step D and door C, the plate E attached to the door, to operate as a step-cover when the door is closed, and a wheel-fender when the door is open, substantially as and for the purpose specified.

2. A combined step-cover and wheel-fender for carriages, consisting of the flexible plate E, the upper end of which is attached to the carriage-door, and the lower end to the step, all being combined to operate as a step-cover, wheel-fender, and a spring-connection to retain the door in the opened and closed positions, all substantially as set forth.

5,645.—Metallic Seam for Uniting Materials.—JEREMIAH KEITH, Providence, R. I., assignor to T. K. REED, East Bridgewater; said REED assignor to A. B. KEITH, trustee, Boston, Mass.—Patent No. 110,921, dated January 10, 1871. Application filed October 23, 1873.

Claim.—A seam formed of metal fastenings, the adjacent points of which are twisted together, substantially as shown and described.

5,646.—Saw-Hanging.—LAWRENCE MORRISON and ARCH G. HARRIS, Allegheny City, Pa.—Patent No. 101,492, dated April 5, 1870.—Division A. Application filed July 24, 1873.

Claim.—1. A pitman-head having outer jaws A A, to which the wrist-pin is attached, and inner adjustable jaws C C, carrying the catch or guide pins B B, substantially as shown and described.

2. A pitman-head having outer jaws A A and inner adjustable jaws C C, combined with an adjusting-screw, E, substantially as shown and described.

5,647.—Saw-Hanging.—LAWRENCE MORRISON and ARCH G. HARRIS, Allegheny City, Pa.—Patent No. 101,493, dated April 5, 1870.—Division B. Application filed July 24, 1873.

Claim.—An open-bottomed saw-buckle, constructed substantially in the manner shown and described.

INDEX OF INVENTIONS PATENTED NOV. 4, 1873.

	Class No.	Whole No.
Axle, vehicle, L. Martin	31	144,378
Axles, sand band for vehicle, Winchell and Rugg	31	144,344
Bags, manufacture of traveling, J. W. Lieb	108	144,349
Balance, E. C. Pickering	138	144,362
Bed bottom, spring, J. S. Judson	68	144,326
Beef, machine for slicing dried, A. Lake	99	144,345
Beefsteak tenderer, J. S. Morris	99	144,316
Billiard cue tip, G. W. Dickinson	142	144,304
Blackboard, J. Reber	146	144,369
Blackboard, revolving, C. B. Lyon	146	144,312
Boiler, steam, Worswick and Lewis	149	144,378
Boiler, wash, R. J. Harrison	91	144,324
Boilers, composition for removing and preventing incrustations in steam, C. Burfitt	149	144,354
Bolt, seal, J. E. Thomson	99	144,370
Bolt for prison doors, T. Lalor	74	144,310
Boot tree, T. Branigan	71	144,318
Bosom and collar, combined over, I. T. Dyer	99	144,307
Box, match, M. L. Orum	99	144,333
Caps, mechanism for shearing, Cooke and Hanford, (Div. A.) (reissue)	78	5,642
Car axle, G. W. Miltimore	139	144,347
Car brake, W. Naylor	139	144,351
Car brake, Warwick and Duggan	139	144,360
Car coupling, W. E. Coppert	139	144,357
Car coupling, W. B. Smedaker	139	144,363
Car coupling, J. M. Wells	139	144,366
Car coupling link guide, Wariner and Johnson	139	144,367
Car heater, Bergheaven and Kiesling	154	144,183
Car propeller, Steel and Austin	139	144,335
Car replacer, J. G. Burkhardt	130	144,188
Car spring, volute, P. G. Gardiner	139	144,291
Car starter, A. H. Crozier	139	144,289
Car wheel, G. Ematlo	139	144,195
Carriage cover, E. H. Elliott	31	144,193
Carriages, die for forging offsets or stay ends for, D. Wilcox	31	144,375
Carriages, step cover and wheel fender for, J. W. Gosling, (reissue)	31	5,644
Cattle stanchion, C. W. Sawdey	144	144,360
Chair, Morrison and Hutchinson	62	144,249
Churn dasher, G. Ridler	65	144,329
Clock escapement, A. Platt	35	144,267
Comb holder, E. E. Wheeler	101	144,243
Compound for cleaning metals, &c., W. Z. Moore	35	144,315
Condenser and feed water apparatus, combined, J. S. Gibson	149	144,281
Cooler, milk, E. Martin	45	144,243
Cornice and gutter, metallic, J. B. Cornell	4	144,229
Cotton chopper and cultivator, M. L. Nagra	43	144,261
Cultivator, S. Crutcher	43	144,231
Cultivator, A. S. McDowell	43	144,245
Curtain fixture, H. E. Marchand	68	144,303
Cushion, mattress, &c., spring, D. H. Selleg	68	144,359

	Class No.	Whole No.
Dolls, manufacture of, L. F. Walker	143	144,373
Door check, J. Bader	94	144,946
Door check, M. R. Perkins	94	144,272
Door opener, W. H. Phipps	94	144,223
Drop light and hanger, Blaisse and Crites	64	144,309
Eaves trough hanger, T. G. Williams	126	144,299
Elevator for buildings, &c., G. Müller	19	144,350
Engine governor, steam, J. R. Hugon	69	144 204
Engine, hoisting, F. Murgatroyd	79	144,217
Engines, condensing apparatus for marine steam, J. Houpt	150	144,203
Eraser, rubber, G. Stackpole	146	144,364
Fats and deodorizing the gases, apparatus for rendering, H. S. Firman, (reissue)	26	5,643
Faucet, A. D. and J. W. King	167	144,208
Faucet, J. A., and T. McKenna	167	144,213
Fence pickets, machine for cutting the heads of, A. Burnham	174	144,187
Fence, portable, G. Robinson	52	144,228
Fender, G. F. Filley	154	144,269
Fire arm, breech loading, H. A. Castle	18	144,190
Fire escape, Scott and Hilts	79	144,361
Fruit basket, W. P. Wilcox	63	144,376
Furnace for reducing the ores and extracting the precious metals, J. H. Boyd	99	144,186
Furnace for reducing ores containing precious metals, J. H. Boyd	99	144,184
Furnace, hot air, A. Pfund	154	144,355
Furnace, steam boiler, U. B. Stribling	149	144,296
Furnaces, apparatus for feeding fuel to ore reducing, J. H. Boyd	99	144,185
Furnaces, hot air draft for, E. Boughton	154	144,249
Furnaces, steam boiler and other, C. Schemioth	149	144,241
Gage, carpenter's, E. Sahm	29	144,350
Gas and water fittings, machine for tapping, C. C. Walworth	100	144,374
Gas, composition for purifying illuminating, S. P. Parham	88	144,284
Gate, farm, J. C. Rehrer	52	144,291
Glove fastener, L. Ferris	23	144,197
Governor, J. R. Hugon	69	144,205
Grate bar, P. Umbehm	149	144,372
Grave covering, J. R. Abrams	54	144,300
Grease and seed distributer, J. H. Boyd	133	144,250
Halter for hitching horses, pastern, J. C. Ford	72	144,198
Hame, Thornton and Latta	72	144,371
Hammock support, P. Park	62	144,219
Harness, machine for making weaver's, J. H. Crowell	95	144,320
Harrow, A. J. Stewart	73	144,236
Harrow, sulky, P. Speelman	73	144,231
Harvester, H. A. Adams	74	144,179
Harvester, S. D. Carpenter	74	144,189
Harvester, C. S. Stone	74	144,367
Harvesters, dropping platform for, P. Warner	74	144,239
Hats, die for pressing, J. Dasper	76	144,982
Heater, car, Berghausen and Kiesling	134	144,183
Heater, flat iron, J. F. Hall	91	144,335
Hemp brake, J. F. Brake	78	144,301
Hook, snap, C. B. Bristol, (reissue)	93	5,639
Horses, pastern halter for hitching, J. C. Ford	72	144,198
Horses, portable stall for, J. W. Adams	144	144,304
Horseshoe nails, machine for feeding, S. S. Putnam	60	144,226
Land roller, Grow and Sloan	73	144,272
Lantern, R. K. Haynes	90	144,200
Lantern, magic, A. G. Burby	157	144,314
Last block fastener, N. R. Streeter	16	144,368
Latch, door, O. B. Rand	94	144,288
Lathes, gear cutting attachment to, T. O. Mills	100	144,214
Leather, machine for shaving, D. Y. Haas	92	144,273
Leather, removing solids from, M. W. Fry	92	144,328
Locomotive, J. S. French	94	144,271
Looms, shuttle actuating mechanism for, J. R. Norfolk	85	144 210
Lozenge cutting machine, G. H. Copping	6	144,258
Measuring rod and dividers, combined extension, G. H. Dissher	97	144,264
Metallic seam for uniting articles, J. Keith, (reissue)	76	5,645
Mills, condensed, G. and J. G. Borden	45	144,311
Milk, preserving and condensing, G. and J. G. Borden	45	144,310
Nail machine, cut, J. Russell	103	144,229
Nuts, device for dressing the sides of, L. Deeg	14	144,265
Ore pulverizer, S. Gardner	3	144,330
Pad or belt, medicated, A. F. Cooper	98	144,315
Paints, &c., non conducting filling for the walls of, O. M. Spiller	88	144,228
Paneling coach bodies, &c., trestle for, W. M. Knapp	107	144,339
Pantaloons, &c., waistband fastening for, J. A. Haarvig	38	144,334
Paper bag, O. W. Stow	109	144 236
Paper from grain, manufacturing, Stahlin and Haan	108	144,294
Paper pulp, wood grinder for, M. S. and M. E. Otis	108	144,354
Pencil and rubber eraser, combined lead, J. Illfelder	146	144,337
Pin, tidy, G. Doolittle	104	144,325
Pipe, blow, McClure and Ainsworth	19	144,345
Pipe tongs, J. R. Brown	100	144,253
Planing machine, L. Gould	173	144,199
Planter, corn, J. Sloan	133	144,233
Plow, Anschutz, Seidel, and Weber	114	144,308
Plow, R. Cartwright	114	144,255
Plow, cultivating, W. Bagnall	114	144,307
Press, baling, G. Wiseship	7	144,345
Press, meat, J. L. Denforth	26	144,322
Printer, consecutive number, E. M. Evans	15	144,196
Propelling canal boats, &c., L. Bastel	139	144,248
Pump, steam vacuum, W. Burden, (reissue)	116	5,640
Pump, steam vacuum, W. Burden, (reissue)	116	5,641
Purifier, middlings, C. S. Fuller	57	144,329
Railroad chair, D. M. Graham	120	144,332
Railroad rail, M. R. Perkins	120	144,221
Railroad snow plow, C. L. Wood	122	144,377
Railroad switch, G. Keech	120	144,207
Railroad switch, H. H. Potter	120	144,224
Rake, horse hay, A. Ames	77	144,305
Rake, horse hay, A. Ames	77	144,306
Sash molding, R. L. Anderton	30	144,307
Saw, E. Marx	131	144,344
Saw, scroll, J. Atkinson	130	144,181
Saw gage, G. W. Kirby	130	144,209
Saw hanging, Morrison and Harma, (Div. A,) (reissue)	131	5,646
Saw hanging, Morrison and Harma, (Div. B,) (reissue)	131	5,647
Sawing machine, stone, H. Cottrell	153	144,317
Scaffold, adjustable, J. Dillon	30	144 263
Scissors, H. S. Breeden	44	144,251
Scraper, S. Horsey	51	144,202
Seed dropper, J. M. Forden	133	144,327
Separator, grain, S. Lessig, Sr	150	144,211
Separator and scourer, grain, Andrews and Godfrey	150	144,180
Sewing machine hemmer, J. M. Griest	134	144,333
Sewing machine thread cutter, N. Evinger	134	144,326
Sewing machine treadle, W. H. Stewart	134	144,366
Shaft hanger, Orton and Cavert	87	144,353
Shingles, machine for riving, C. Shelmandine	174	144,292
Shoes, pattern for cutting the uppers to, G. Leinroth	16	144,341
Sifter, flour, G. Purple	88	144,225
Slate washer, J. G. Murphy	146	144,280
Soda fountain attachment, O. F. Stedman	1	144,234
Spark arrester, J. Hughes	94	144,275
Spinning and twisting machine, H. A. Chapin	142	144,191
Spring, door, H. Cody	24	144,256
Steering apparatus, M. R. Perkins	139	144,220
Stocking supporter, A. C. Adams	38	144,302
Stocking supporter, A. C. Adams	38	144,303
Stone cutting tool, H. Cottrell	153	144,318
Stone, machine for cutting and working, H. Cottrell	153	144,316
Stone sawing machine, H. Cottrell	153	144,317
Stove, cooking, J. McMaster	154	144,279
Stove door, A. S. Shontz	154	144,230
Stove pipe damper, E. C. Chapman	154	144,192
Stoves, device for retaining fire in, E. Y. Robbins	154	144,357
Sugar, centrifugal machine for draining, P. Cramer	155	144,319
Sugar from molasses, extracting, J. B. Thoms	155	144,309
Sugar, &c., vacuum pan for the manufacture of, J. R. Root	129	144,356
Syringes, cannula point for, E. B. Nimmo	156	144,352
Table slide, extension, J. King	62	144,276
Teeth, artificial crown for, J. B. Beers	46	144,182
Telegraph key, self-closing, W. Hockhausen	50	144,274
Telegraph, printing, G. M. Phelps	50	144,285
Tobacco drying house, E. W. Ellsworth	160	144,194
Trap, cement pipe, A. A. Lovell	90	144,277
Valve, balanced slide, J. Evered	152	144,268
Valve for water pipes, D. G. Phippe	167	144,356
Valve, slide, A. S. Nelson	153	144,282
Valve, slide, W. Stephens	152	144,295
Vehicles, king bolt for, J. Deeble	31	144,323
Vessels, construction of steam, T. and W. L. Winans	137	144,243
Walk edger, Brower and Higgins	75	144,252
Washing machine, M. W. Staples	91	144,365
Washing machine, J. C. Stewart	91	144,237
Watch, A. Frankfeld	36	144,270
Watch gear cutting machine, A. Durini	36	144,266
Water pipes, valve for, D. G. Phippe	167	144,356
Water wheel, G. Curtis	168	144,261
Water wheel, turbine, I. Sherck	168	144,363
Windlass, ship's, Remington, Thayer, and Manton	79	144,227
Wood grinder, J. Bridge	108	144,313
Wool cards, evener for, C. F. Morrison	142	144,348

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED NOV. 4, 1873.

Abrams, J. R., Grave covering	144,300
Adams, A. C., Stocking supporter	144,302
Adams, A. C., Stocking supporter	144,303
Adams, H. A., Harvester	144,179
Adams, J. F., Hemp brake	144,301
Adams, J. W., Portable stall for horses	144,304
Ainsworth and McClure	144,345
Ames, A., Horse hay rake	144,305
Ames, A., Horse hay rake	144,306
Anderton, R. L., Sash molding	144,307
Andrews, S. W., and L. Godfrey, Grain separator and scourer	144,180
Anschutz, A., A. Seidel, and M. Weber, Plow	144,308
Atkinson, J., Scroll saw	144,181
Atwater Manufacturing Company, assignee	144,383
Austin and Steel	144,236
Axtell, H. A., assignee	144,219
Bader, J., Door check	144,946
Bagnall, W., Cultivating plow	144,307
Bastel, L., Propelling canal boats, &c	144,248
Beers, J. B., Artificial crown for teeth	144,182
Berghausen, B., and A. L. Kiesling, Railroad car heater	144,183
Blaisse, G. F., and W. F. Crites, Drop light and hanger	144,309
Borden, G. and J. G., Preserving and condensing milk	144,310
Borden, G. and J. G., Condensed milk	144,311
Boughton, E., Hot air draft for furnaces	144,249
Boyd, J. H., Furnace for reducing ores containing precious metals	144,184
Boyd, J. H., Apparatus for feeding fuel to ore reducing furnaces	144,185
Boyd, J. H., Furnace for reducing the ores and extracting the precious metals	144,186
Boyd, J. H., Grease and seed distributer	144,250
Branigan, T., Boot tree	144,312
Breeden, H. S., Scissors	144,251
Bridge, J., Wood grinder	144,313
Bristol, C. B., Snap hook, (reissue)	5,639
Brower, L. V., and J. C. Higgins, Walk edger	144,252
Brown, J. R., Pipe tongs	144,253
Burfitt, C., Composition for removing and preventing incrustations in steam boilers	144,254
Burkhardt, J. G., Car replacer	144,188
Burnham, A., Machine for cutting the heads of fence pickets	144,187
Burden, W., Steam vacuum pump, (reissue)	5,640
Burden, W., Steam vacuum pump, (reissue)	5,641
Busby, A. G., Magic lantern	144,314
Cable, A. D., assignee	144,196
Carpenter, S. D., Harvester	144,189
Cartwright, R., Plow	144,255
Castle, H. A., Breech loading fire arm	144,190
Cavert and Orton	144,353
Chapin, H. A., Spinning and twisting machine	144,191
Chapman, E. C., Stove pipe damper	144,192
Cody, H., Door spring	144,256
Comstock, Castle & Co., assignees	144,230
Cooke, E., and T. Hanford, Mechanism for shearing caps, (reissue)	5,642
Cooper, A. F., Medicated pad or belt	144,315
Coovert, W. R., Car coupling	144,257
Copping, G. H., Lozenge cutting machine	144,258
Cornell, J. B., Metallic cornice and gutter	144 259
Cottrell, H., Machine for cutting and working stone	144,316
Cottrell, H., Stone sawing machine	144,317
Cottrell, H., Stone cutting tool	144,318
Cramer, P., Centrifugal machine for draining sugar	144,319
Crites and Blaisse	144,309
Crossman, E., assignee	144,210
Crowell, J. H., Machine for making weaver's harness	144,320
Crozier, A. H., Car starter	144,260
Crutcher, S., Cultivator	144,321
Curran, P. and E., assignees	144,361
Curtis, G., Water wheel	144,261
Danforth, J. L., Meat press	144,322
Davis, J., assignee	144,262
Deeble, J., King bolt for vehicles	144,323
Deeper, J., Die for pressing hats	144,263
Dickinson, G. W., Billiard cue tip	144,324
Dillon, J., Adjustable scaffold	144,263
Dissher, G. H., Combined extension measuring rod and divider	144,264
Deeg, L., Device for dressing the sides of nuts	144,265
Doolittle, G., Tidy pin	144,325
Duggan and Warwick	144,240
Durini, A., Watch gear cutting machine	144,266
Dyer, I. T., Combined over bosom and collar	144,267
Eccles, S., Jr., assignee	144,309
Elliott, E. H., Carriage cover	144,193
Ellsworth, E. W., Tobacco drying house	144,194
Elmslie, G., Car wheel	144,195
Evans, E. M., Consecutive number printer	144,196
Evered, J., Balanced slide valve	144,268
Evinger, N., Sewing machine thread cutter	144,326
Ferris, L., Glove fastener	144,197
Filley, G. F., Fender	144,269
Firman, H. S., Apparatus for rendering fats and deodorizing the gases, (reissue)	5,643
Ford, J. C., Pastern halter for hitching horses	144,198
Forden, J. M., Seed dropper	144 327
Frankfeld, A., Watch	144,270
French, J. S., Locomotive	144,271
Fry, M. W., Removing acids from leather	144,328
Fuller, C. S., Middlings purifier	144,329
Gardiner, P. G., Volute car spring	144,201
Gardner, S., Ore pulverizer	144,330
Gibson, J. S., Condensed condenser and feed water apparatus	144,331
Godfrey and Andrews	144,180
Gosling, J. W., Step cover and wheel fender for carriages, (reissue)	5,644
Gould, L., Planing machine	144,199
Graham, D. M., Railroad chair	144,332
Griest, J. M., Sewing machine hemmer	144,333
Grow, W. H., and C. M. Sloan, Land roller	144,272
Haan and Stahlin	144,294
Haarvig, J. A., Waistband fastening for pantaloons, &c	144,334
Haas, D. Y., Machine for shaving leather	144,273
Hall, J. F., Flat iron heater	144,335
Hammond, H. F., assignee	144,202
Hanford and Cooke, (reissue)	5,642
Harma and Morrison, (reissue)	5,646, 5,647
Harrison, R. J., Wash boiler	144,336
Harwood, G. S., assignee	144,242
Haynes, R. K., Lantern	144,200
Head, J., assignee	144,241
Higgins and Brower	144,252
Hilts and Scott	144,361
Hockhausen, W., Self-closing telegraph key	144,274
Horsey, S., Scraper	144,202
Horton, J. M., assignee	144,189
Houpt, J., Condensing apparatus for marine steam engines	144,203
Hughes, J., Spark arrester	144,275
Hugon, J. R., Steam engine governor	144,204
Hugon, J. R., Governor	144,205
Hunteon, H. P., assignee	144,239
Hutchinson and Morrison	144,364
Illfelder, J., Combined lead pencil and rubber eraser	144,337
Ilse, A., Machine for slicing dried beef	144,206
Johnson and Warriner	144,277
Judson, J. S., Spring bed bottom	144,208
Keech, G., Railway switch	144,207
Keith, J., Metal seams for uniting articles, (reissue)	5,645
Kendrick, J. and J. H., assignees	144,239
Kervan, F. B., assignee	144,240
Kiesling and Berghausen	144,183
King, A. D. and J. W., Faucet	144,208
King, J., Slide for extension tables	144,278
Kirby, G. W., Saw gage	144,209
Knapp, W. M., Trestle for painting coach bodies	144,339
Laler, T., Bolt for prison doors	144,210
Latta and Thornton	144,371
Leeds, J., assignee	144,235
Leinroth, G., Pattern for cutting the uppers to shoes	144,341
Lessig, S., Sr., Grain separator	144,211
Lewis and Worswick	144,378
Lieb, J. W., Manufacture of traveling bags	144,340
Lovell, A. A., Cement pipe trap	144,277
Lyon, C. B., Revolving blackboard	144,212
Manton, Remington, and Thayer	144,227
Marchand, H. K., Curtain fixture	144,342
Martin, E., Milk cooler	144,343
Martin, L., Vehicle axle	144,278
Marx, E., Saw	144,344
McClure, J. E., and D. H. Ainsworth, Blow pipe	144,345
McDonell, A. S., Cultivator	144,346
McKenna, J., A., and T., Faucet	144,213
McMaster, J., Cooking stove	144,279
Miller, F. E., assignee	144,202
Mills, T. O., Gear cutting attachment to lathes	144,214
Miltimore, G. W., Car axle	144,347
Moore, W. Z., Compound for cleaning metal, &c	144,215
Morris, J. S., Beefsteak tenderer	144,216
Morrison, C. F., Evener for wool cards	144,348

Worswick, J. R., and E. Lewis, Steam boiler 144,378

COPIES OF SPECIFICATIONS AND DRAWINGS.

Persons desiring copies of all specifications and drawings of any particular class of patents can purchase them at the rate of ten cents each, and have them mailed, free, to their address, as soon as possible after the patents are issued, by leaving a deposit of not less than three dollars with the Commissioner of Patents. The index of classes for subscribers, date of September, 1871, is furnished gratis to any applicant.

In ordering copies of any drawing or specification, the name of the inventor and patentee, the title of the invention, and the date of the patent must be given; and for any search required in consequence of the omission of any of these data a charge of one dollar may be made. So in ordering a copy of an assignment, the liber and page of the record, as well as the name of the inventor, must be given; otherwise an extra charge will be made for the time consumed in making any search that may become necessary.

Copies of the specifications and drawings of design patents will be furnished by the Patent Office at the cost of making them. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount to be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

The following abbreviated forms of the Patent Office classification by subject-matter may be of assistance to persons ordering copies of specifications and drawings by class. Of course the classes vary somewhat in number of patents, and in following a branch of industry it may be necessary to group several classes to secure absolute completeness. These groupings will readily suggest themselves to the inventor or mechanic.

Copy of classification in full for the use of subscribers furnished on application.

Aërated liquor apparatus 1
Air and gas engines 2

DIGEST OF FOREIGN PATENT LAWS.

SWEDEN.

REPORT BY MR. NASSAU JOCELYN, OF THE BRITISH LEGATION.

The law regulating the issue of Letters Patent for inventions in Sweden is dated August 19, 1856, and is as follows:

SECTION 1. Letters Patent convey to the holder the right during the term for which the patent is granted, and to the exclusion of others personally, or by substitute, at any place within the Kingdom, to practice and employ the invention and produce the articles for which the patent is granted, and to offer such articles for sale; the said holder being bound to observe the enactments contained in existing statutes relative to the manufactures and sales of goods, yet without being bound in connection with the enjoyment of the aforesaid rights to acquire the position of master tradesman or citizen. Patent rights shall be considered the lawful property of the holder, and may consequently be bequeathed and inherited or transferred, by any kind of legal document, to another person, together with all the rights conferred by the Letters Patent.

SEC. 2. Letters Patent may be obtained—

1. On new inventions connected with industry or art;

2. On improvements upon previous inventions connected with industry and art, provided always that no innovation be thereby caused on patent rights already granted.

Letters Patent shall not be granted for medical preparations, or for inventions of such a character that their employment would evidently be at variance with existing laws, the public safety, or good morals. Neither shall any person, by Letters Patent, obtain the exclusive right of employing in a general manner a new principle; but only to employ the ways and means for the application of any invention, which are stated and described in the application for the patent.

SEC. 3. Letters Patent may be granted for terms of not less than three years, and not exceeding fifteen years, according to the character and importance of the invention.

SEC. 4. Inventors only, whether Swedes or foreigners, shall be entitled to Letters Patent, pursuant to the foregoing enactments.

SEC. 5. If any person shall have obtained Letters Patent abroad, upon any invention, and in connection with it have been compelled to publish a specification of the manner of employing it, he may, nevertheless, also obtain Letters Patent upon such invention in this Kingdom for a specified term, pursuant to section 3, yet not for a term beyond the date at which the patent granted abroad shall expire.

SEC. 6. Any inventor desiring Letters Patent shall deliver an application to that effect to the royal and national board of trade; which application, in addition to describing the subject in question, shall contain a plain declaration whether the invention for which the Letters Patent are required is a new one, or whether it constitutes an improvement upon any invention already employed, and also a statement of the term for which the applicant desires to enjoy the patent rights. Likewise it must contain a correct and complete specification of the invention, and the manner in which it is to be employed, together with the detailed drawings or models, when such are requisite. The said descriptions and drawings shall be delivered, sealed, to the board, and be opened when the application for the patent is taken into consideration; after which they shall be kept in the chancery of the board, and be accessible to those who wish to consult them. If the applicant be not in a position to deliver a complete description immediately, he shall state such inability in his appli-

cation. The board will then grant the applicant, by protocol—which, after being previously posted, shall be issued—an extension of one month from the date of posting such protocol, within which term the applicant shall deliver the said description; and the board shall postpone its decisions until the expiration of the term so allowed. Should the applicant fail to appear with the said specification within the appointed term, his application shall become void. This, notwithstanding, the applicant shall not be precluded from delivering in a new application to the board on the same subject. The application referred to in this section shall, in the event of the applicant not living in the Kingdom, be delivered by some person resident in Sweden, whose name and place of abode shall be sent in to the board of trade for registration, and who, before the application can be taken into consideration, shall, together with his name and place of abode, also hand in to the board a power of attorney from the applicant, empowering him to act and plead on the applicant's behalf in all that relates to the said patent.

SEC. 7. The documents connected with the application having been completed and handed in to the board of trade, in conformity with the previous section, the board shall proceed to the consideration of the matter, and, provided no hinderance in pursuance of this statute exists, shall issue Letters Patent on the invention notified. The Letters Patent shall comprise the main contents of the application; the specification handed in, with reference to the drawings or models, provided such have been annexed; the term for which the patent is granted; the rights conferred by the Letters Patent; and also the obligations incumbent upon the holder of the patent as a condition for the enjoyment of the patent rights. And, further, the Letters Patent shall declare that the said patent shall not be considered to convey an assurance that the invention is new, or that it can be employed with advantage.

SEC. 8. If two or more applicants apply for Letters Patent on an invention of the same character, that applicant shall be entitled thereto who shall have first handed in complete documents to the board of trade.

SEC. 9. When Letters Patent are ready to be delivered to the applicant, the fact shall be announced by means of a notification, to be posted in the outer room of the board of trade. The Letters Patent shall be dated on the day upon which this notification is posted; and the term for the enjoyment of the patent shall commence from such date.

SEC. 10. The person to whom a patent has been granted shall be bound—

1. To make the Letters Patent publicly known by publishing them in full three times in the *Post Tidning*, (the official gazette;) and that said publication shall be effected within two months from the day on which the notification of the Letters Patent being ready for delivery shall have been posted;

2. To produce evidence before the board of trade, within two years from the last-mentioned day, that he is actively employing the patented invention; the said two years may, however, be limited by the board to one year; and also, on representation then made, be extended to a term not exceeding four years, according to the character and scope of the invention;

3. To produce evidence in like manner, every year during the whole term of the patent, that the invention continues to be employed.

SEC. 11. If the holder of the Letters Patent wishes to transfer his patent to another person, he shall notify his intention to the board of trade, who will issue a resolution to that effect; and the new holder shall be reminded in the said resolution of the obligations incumbent upon him in connection with the continued enjoyment of the said patent. If Letters Patent be transferred to any person residing out of the Kingdom, he shall be bound to provide an attorney, in the manner enacted in the latter clause of section 6.

SEC. 12. If Letters Patent be obtained on an invention of a similar character to any previously patented or employed by another person in this Kingdom; or if the holder of a patent deliver an incorrect or so incomplete a specification of the manner and means which should be employed in the use of his invention, that reliable guidance be not afforded for forming a judgment of the real character of the invention; or if the holder of the patent falsely state himself to be the inventor; or if a patented invention prove dangerous to the public safety and health, or conduce to anything at variance with good morals, then any person who shall consider his rights to be infringed, and the public prosecutor, when the public advantage requires it, may institute an action against the Letters Patent so issued, before the public court of justice, at the place where the holder of the patent resides; or, if he reside out of the Kingdom, at the place where his authorized attorney resides; and, in the event of any of the above causes of complaint being established, the court shall order the patent to be canceled; in which case a copy of the said judgment shall, without loss of time, be sent in to the board of trade, which, after the said judgment shall have obtained legal force, shall proceed in the manner prescribed by section 16.

SEC. 13. If, in the opinion of the holder of a patent, any other person shall, subsequently to the granting of the said patent, unlawfully employ the patented invention, the said holder of the patent may enforce his rights by suing such person before a public court of justice at the place where the accused resides. If the holder of a patent prove that his rights have been infringed, as aforesaid, the offender shall be subject to a fine for the first offence of not less than 100 rix dollars, (equal to $111 50,) and not exceeding 200 rix dollars, Swedish currency, (equal to $223;) and should the offence be repeated, to a fine of not less than 200 rix dollars, and not exceeding 400 rix dollars; and on each occasion full compensation for damages shall be given to the holder of the patent. One-half of the fine shall be paid to the holder of the patent, who alone shall be entitled to commence such actions, and the other half to the poor of the parish in which the person who is fined resides. The said fine shall, in default of payment on the part of the person sentenced, be commuted to "simple" imprisonment, in conformity with the rules for such commutation established by law.

SEC. 14. If, in the prosecution before a court of justice of any action for the infringement of a patent, it should be found that the invention in respect of which such patent has been granted, was known and employed in the Kingdom before the application for the patent had been handed in to the board of trade; or that the holder of the patent had handed in an incorrect or so imperfect a description of the manner and means which should be employed in the use of the invention, that reliable guidance be not afforded for forming a judgment of the real character of the invention; or that the holder of the patent has falsely stated himself to be the inventor, the defendant shall in every such case be acquitted.

SEC. 15. Letters Patent shall be forfeited and canceled—

1. If the holder of the patent shall neglect to perform any of the prescriptions contained in the aforesaid section 10;

2. If in consequence of any suit such as those referred to in section 12, a court of justice order the patent to be canceled.

SEC. 16. It shall be the duty of the board of trade, both in those cases in which the patent rights have been forfeited or canceled, and also when the term for which Letters Patent have been granted shall have expired, to publish in the official gazette that the said Letters Patent have become null and void.

SEC. 17. Whenever in this statute the period of one month is stated, it is to be understood as containing thirty days.

SEC. 18. This statute shall be in force after the 1st day of October next; after which date the enactments not in operation on the same subject shall cease to be in force, without, however, affecting the legal rights already conferred in existing patents. On February 22, 1867, an additional provision was made with regard to the tenth section of the above act. It imposed upon all persons desiring to take out Letters Patent the obligation of not only proving, within two years of their issue, that the invention had been in full work, but that it had been so worked within the Kingdom of Sweden. The validity of the patent, during the whole of its term, depends, moreover, upon the annual reiteration of this assertion. The above period of two years may likewise, in virtue of this act, be reduced to one year, or extended to four, at the option of the board of trade.

The issue of patents by the government has existed only since the year 1834; before which time the King alone was empowered to grant a monopoly, or *privilegia exclusiva*, for the working of an invention. It was only granted on account of inventions of great importance and undoubted public utility, and was consequently of rare occurrence.

It will be seen from the foregoing acts that the issue of Letters Patent is altogether in the hands of the board of trade, from whose decision, with regard to the merits of an invention, there is no apppeal. This board consists of four members and a president, who is allowed to give a casting vote when necessary. Their deliberations in matters referring to patents are generally aided on technical questions by a consulting expert, at present an intelligent officer of engineers; and the time which elapses between the application, accompanied by the necessary specification and drawings, &c., and the issue of the Letters Patent seldom exceeds one month.

No patent is granted for more than fifteen years, and its duration is determined by the board, according to the evidence which they may have obtained as to its merits and relative importance.

The expense of taking out a patent is very trifling. Five rix dollars, say $5.57, are paid for every year for which the patent is granted by the board, the whole sum being paid in advance; and, besides, a stamp duty of 9½ rix dollars, equal to about $10.60, the amount being entered as received in the Letters Patent when signed.

The board of trade, in considering the claims of an inventor to a patent, do not inquire into their validity, but merely as to the individual merits of the invention. The onus of proving the patent valid rests solely with the patentee; and should a fraud have been committed by him and be proved against him, the patent is simply canceled by the court of justice, according to the provisions of the act, without further consultation with the board.

It is obvious that unusual facilities are offered by this system to persons who wish to patent improvements upon the inventions of others, however trivial they may be, no documentary evidence being required to prove the consent of the original inventor to the grant of the new patent. Practically, however, the board keep a sharp eye upon such petitioners, and by far the greater number of their applications are rejected without mercy, almost universally, indeed, when the originator of the idea improved upon is working his patent principally in Sweden.

The general feeling seems to be that it is unquestionably desirable to maintain the grant of patents in this country. In the annual sittings of the Diet there are not wanting members to raise objections against them; but these are usually received either in silence or with unmistakable signs of disapprobation by the Chamber, and are made by men of comparatively little influence in that assembly. On the whole, therefore, the community at large appear to agree that it is better for the public to pay a patentee for his invention than that the budget of the country should be increased by so large an item as that of the rewards which inventors would naturally expect to receive from the government in compensation for the privilege of enjoying, for a time at least, the exclusive profits to be derived from their ideas and from their labors.

COMMISSIONER'S DECISIONS.

JOHN AND JAMES DOBSON.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief, in the matter of the application of John and James Dobson, for patent for* DELIVERY AND DRAWING HEADS FOR WORSTED CARDS.—*Decided October 21, 1873.*]

Although a combination of an endless apron and a delivery-head composed of three rollers has been employed in preparing cotton for spinning, it is patentable to employ like devices in preparing wool for spinning, since it required a special adaptation of the drawing-head for that purpose.

LEGGETT, *Commissioner:*

Applicants claim—

In preparing wool on cards for combing and delivering the sliver from a number of cards through one delivery, the combination of endless apron B and a delivery-head composed of three pairs of rollers, as shown and described.

They are cited by the Examiner to the patent of W. B. Leonard, which shows an endless belt and a delivery-

head composed of three pairs of rollers, to be used in the same connection and for the same purpose, except that they are intended to receive and deliver a cotton bat instead of a woolen one. The delivery-head for cotton would not serve for wool, on account of the difference in the nature of the fibers of the two substances. So, of course, applicants must employ a delivery-head adapted to wool.

The Examiner says that such delivery-heads are old; but it appears that precisely such heads have not before been employed, nor have drawing-heads for wool been employed in this connection. They are shown, so far as this record exhibits, as applied to the treatment of yarn, but not to the manipulation of sliver. Applicants have adopted the general plan already in use for treating cotton, for treating wool; but to do this, special adaptation of a drawing-head was required. Therefore, the plan being advantageous for treating wool as compared with the old plan of balling, invention must be presumed. It may safely be predicated on such a change followed by such results as are set forth.

The decision of the Board is, therefore, reversed, and a patent will be granted.

DAVIS, EDSON, *et al.*—*Interferences.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the applications of Richard H. Norris, David P. Davis, James B. Edson, and Richard C. Blake, for patent for* IMPROVEMENT IN RECORDING STEAM-GAGE.—*Decided October* 18, 1873.]

The applicant who first produced a perfect-working specimen of the invention in dispute, adjudged the prior inventor, although another had conceived it before him and made a drawing of it, which he had explained to another person, but had shown no diligence in reducing it to practice.

LEGGETT, *Commissioner:*

Norris and Blake have taken no testimony, and the record-dates upon which they rest take them practically out of the controversy, which remains between Edson and Davis. Edson filed his application June 27, and Davis September 26, 1871. Exhibit I, filed by Edson, is a complete gage embodying the invention in dispute, and is conceded by Davis to have been made in August, 1870. Edson rests his case mainly on this exhibit and admission. Davis does not maintain that he made a gage like this previous to August, 1870, or, indeed, until July, 1871; but sets up that he conceived the idea of such an invention in 1866, and afterward explained it to his brother. His brother's testimony, however, does not corroborate this statement. Nothing tangible is produced showing that he made the invention before 1871, a year after Edson is admitted to have perfected it.

Exhibit D, a very imperfect pencil-sketch purporting to be from his diary of 1866, is too dubious evidence to be relied on. But admitting the conception of the invention by Davis in 1866, which is not satisfactorily proved, he does not show reasonable diligence in perfecting, embodying, and reducing it to practice. The caveat and patent of Davis nowhere exhibit this invention, and he fails in every respect to satisfactorily make out his case.

The decision of the Board awarding priority of invention to Edson is affirmed.

STANTON AND PERLEY.—*Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the application of John W. Stanton and Henry C. Perley, for patent for* IMPROVED MODE OF EXTINGUISHING FIRES IN OIL-TANKS.—*Decided October* 20, 1873.]

The patent for extinguishing fire in oil-tanks by covering the oil with carbonic-acid gas, introduced beneath and allowed to rise to the surface, awarded to the party who first effected it by mixing in the tank under water the chemical re-agents for forming the gas, although his competitor had anticipated him in the better method of forcing the gas from a reservoir outside into the oil.

LEGGETT, *Commissioner:*

The invention in controversy relates to extinguishing fires in oils or other inflammable liquids by the use of carbonic-acid gas. It consists in a mode of depositing the gas—which is non-combustible and lighter than oil and heavier than air—upon the burning surface of the oil, so as to form a stratum which will separate the oil from the atmosphere that supports combustion. This has heretofore been attempted by forcing the gas through the flames upon the burning surface, but without success. The draft of the fire prevented its successful deposition. Both these applicants conceived the idea of introducing it from beneath, and letting it rise through the oil to the surface. Stanton, who was first to hit upon this idea and carry it into execution, generated the gas by the admixture of the proper chemical elements in the bottom of the oil-vessel beneath a stratum of water. Perley formed his gas outside, and injected it into the bottom of the oil-vessel. It is admitted that Stanton preceded Perley in what he did; but it is maintained in behalf of Perley that Stanton did not conceive nor perfect the real invention until after Perley did—that is, he did not form the gas outside and inject it into the oil and let it rise to the surface. The gist of the invention, however, is the introduction of the gas successfully upon the burning surface of the oil from below. The time and place of forming it are immaterial to this mode of introducing it for the extinguishment of the flames. The generation of the gas either in or out of the vessel containing the oil is not new, and whether formed within or injected within the vessel, it alike rises to the surface and extinguishes the fire. The plan of its deposition on the surface through the action of gravitation comprehends all of the invention.

The decision of the Board awarding priority to Stanton is, therefore, affirmed.

CHARLES H. TOLL.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of Charles H. Toll, for patent for* IMPROVEMENT IN SACKING BROOMS.—*Decided October* 21, 1873.]

An ordinary paper bag used for sacking brooms cannot be claimed as an invention independent of the process of sacking.

It is common to adjust the height of parts of machinery by providing holes into which the bolts may be inserted by which they are suspended, and to adjust the height of the pressing-box in a machine for sacking brooms by these means is not patentable.

LEGGETT, *Commissioner:*

The second claim in this application has been allowed by the Examiner and the third by the Board, with the condition—which I approve—that the word *constructed* be inserted before the word "substantially" in said claim.

The first and fourth claims have been rejected by both of these tribunals. These claims are as follows:

1. For the purpose of sacking brooms, the sack F, when made independent of the process of sacking, substantially as herein described.

4. The manner of adjusting the compressing-box, substantially as and for the purposes set forth.

The sack F is an ordinary paper sack with nothing novel or peculiar in its construction. The fact that it is employed to cover a broom does not make it new or patentable.

"The manner of adjusting the pressing-box" does not constitute an invention. The trough C is pivoted on bolts on each side, and several bolt-holes are provided, and the bolts are placed in one or another to raise or lower the trough, as desired. This is the ordinary "manner of adjusting" in common use in all classes of machinery, and is old and well known. No doubt, as the Board have suggested, a claim might be allowed in this or another application for the mode of sacking brooms here indicated. But the first and fourth claims are obviously not such as can be properly granted.

The opinion of the Board correctly expresses my views in this case, and it is accordingly affirmed.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT, SOUTHERN DISTRICT OF NEW YORK.

[*In equity.—Before Blatchford, Circuit Judge.—Decided September* 25, 1873.]

JOHN BACHELDER *vs.* WILLIAM J. MOULTON *et al.*

[*Solomon J. Gordon* and *George Gifford*, for complainant. *Theodore Ongley* and *Andrew Boardman*, for defendants.]

BLATCHFORD, *J.:*

The reissued Letters Patent granted to the plaintiff December 12, 1865, for an improvement in sewing-machines, and on which the motion for a provisional injunction in this case is made, were the foundation of the suit of *Potter* vs. *Braunsdorf*, (7 Blatchf., C. C. R., 97,) decided by this court on final hearing. Every question necessary or pertinent to the decision of the present motion was considered in that case, and disposed of adversely to the defense. Since that time such reissued patent has been, by an act of Congress, approved July 14, 1870, (16 U. S. Stat. at Large, 656,) extended for seven years from the 8th of May, 1870.

The sewing-machine of the defendants in the former case was called the Ætna machine, and employed, as a perpetual feeding device, a cylinder moving intermittently by revolving on a horizontal axis, and so arranged that the cloth laid horizontally upon it and was partially supported by it. Such cylinder was situated immediately in front of the needle, and was provided with a roughened surface, which acted from below, through an aperture in a horizontal table, upon the under surface of the cloth to be fed, and operated, in feeding, in combination with a yielding curved pressure-foot, which was pressed from above, by a spring, upon the upper surface of the cloth, such foot also acting as a needle-stripper. The Ætna machine was provided, also, with the other devices necessary to make up the combinations covered by the first, second, third, fourth, fifth, sixth, and eleventh claims of the Bachelder patent—namely, a reciprocating eye-pointed needle and a reciprocating needle-carrier, moving substantially in vertical planes; a horizontal holding surface provided with a throat for the passage of the needle, (such holding surface forming part of the supporting bed,) and a table, a part of which was so arranged, with reference to the feed, as to receive and aid in supporting the material in its passage from the feed. In the Ætna machine the material could be fed perpetually while it was supported horizontally, and a seam of any length could be sewn without requiring the sewing to be stopped at any time to attach a fresh portion of the material to the feeding instrument. This is a material feature distinguishing the Bachelder machine from those which preceded it. The Ætna machine had, it is true, a capacity beyond that of the Bachelder machine—namely, that of sewing a seam of any desired curvature, arising from the fact that, in the Bachelder machine, the material is impaled on pins, while, in the Ætna machine, the roughened surface of the feeding-cylinder engaged with the material only to such extent as was necessary to move the material forward, but not to such extent as to prevent the free lateral turning of the material by the operator during the process of feeding, so as to produce a curved or angular seam. But this, though an improvement on Bachelder's invention, embodied that invention.

The machine of the defendants in the present case is known as the Whitney sewing-machine, and uses, as a perpetual feed, what is known as the feed of Allen B. Wilson. That feeding arrangement was covered by two patents issued to Wilson, which have now expired. One of them, reissue No. 346, issued January 22, 1856, was extended, and expired November 12, 1871. It covered, in its claims, four features of invention: First, the described method of causing the material to be sewed to progress regularly by the joint action of the surfaces between which it is clamped, and which act in conjunction; second, holding the material at rest by the needle, or its equivalent, in combination with the method of causing it to progress regularly; third, arranging the described feeding-surfaces in such relation to the needle that they, or one of them, shall perform the office of stripping the material from the needle; fourth, so mounting and attaching one of the feeding-surfaces to some other part of the machine that it may be removed or drawn away from the other surface at pleasure. The other patent, reissue No. 414, issued December 9, 1856, was extended, and expired November 12, 1871. It covered, by one of its claims, a combination of three elements—namely, a table or platform to support the material to be sewed, holding it for the action of the needle, and presenting it properly to the grasp of the feeding apparatus—a sewing mechanism proper consisting of a needle and shuttle, or their equivalents, and a mechanical feed, automatic, and causing the cloth to progress regularly, to which the cloth is not attached, and so grasping the cloth that it may be turned and twisted by the hand of an operator, such twisting not interfering with the regular progression of the cloth. The feed of Wilson consists of two surfaces or bars which clamp the material. The material is advanced and moved forward under the needle, to receive the stitches, by the joint operation of such two surfaces or bars. One of such bars has a rough surface and a lateral motion. The other has a smooth surface and no lateral motion.

The machine of the defendants has Bachelder's hori-

zontal holding-surface, in having a small horizontal round plate, through slots in which teeth on the reciprocating feed-bar project upward, on which plate the material immediately about the needle rests, so as to be borne up horizontally under the thrust of the needle, such plate being perforated with an opening or throat for the passage of the needle.

The machine of the defendants has Bachelder's receiving-plate, in that portion of the said round plate which receives and supports the material as it passes from the feed.

The machine of the defendants has Bachelder's yielding pressure-holder, in having a spring pressure-foot near the needle, which rests on the upper surface of the material, and holds the material to the bed on which it is supported, the pressure-foot adapting itself to variations in the thickness of the material.

The machine of the defendants has a reciprocating eye-pointed needle, and a reciprocating needle-carrier, substantially like those of Bachelder.

In all these particulars in which the Ætna machine was like the Bachelder machine, the defendants' machine does not differ from the Ætna machine. This embraces all particulars except the feed. In the defendants' machine the cloth is advanced regularly and horizontally, by an intermittent motion, through the joint action of the rough surface of the moving bar beneath and the surface of the pressure-foot above. It is apparent that, in the arrangement and operation of the defendants' feed, and its relations to other co-operating parts of the machine, there are the following material features in common with Bachelder's machine: The cloth lies horizontally on the feeding device, and a portion of the surface of the cloth which lies immediately in front of the needle and of the horizontal holding surface is supported by the feeding device during the act of feeding. The material is fed perpetually, so that a seam of any length can be sewn without removal or replacement of the parts of the machine. The material is delivered, with a seam sewn in it, upon the receiving-plate.

In the Bachelder machine, different portions of the belt are feeding at different times, as, in the Ætna machine, different portions of the cylinder were feeding at different times, while, in the defendants' machine, the same part of the feeding-bar always acts in feeding. But this difference is immaterial. The action, in feeding, of the parts employed at any one time in feeding, is the same in the two machines, so far as the essence of Bachelder's invention of a perpetual feed is concerned. So, too, it is an immaterial difference, that, in the Bachelder machine, the feeding device is always in contact with the material, and always aids in supporting it, while, in the defendants' machine, the feeding device is not always in contact with the material, and, therefore, only aids at intervals in supporting it. Equally immaterial is it that, the defendants' feeding-bar, being provided with a roughened surface instead of with impaling-pins, seams of any desired angularity or curvature can be sewn in the defendants' machine, while such seams cannot be sewn in the Bachelder machine. But this is the same difference which existed between the Ætna machine and the Bachelder machine. The increased capacity given to the machine by the facility of turning and twisting the material, due to the absence of impaling-pins, is an improvement, but the vital features of Bachelder's arrangement are retained. The feeding device of the defendants has a horizontal surface, which, at the time of feeding, aids in supporting the material, and thus makes the feeding possible, and is a perpetual feed, and delivers the material to and upon the receiving-plate.

The point most strenuously urged on behalf of the defendants is, that heretofore suits have been brought in many of the courts for infringements of the reissued patents of Wilson before mentioned, Nos. 346 and 414; that the defendants in those suits have set up the prior existence of the Bachelder machine, and the prior granting of the Bachelder patent, as destroying the novelty of the above-recited claims of the Wilson patents; and that it has been uniformly held that there was nothing in the Bachelder machine or the Bachelder patent to invalidate those claims. These decisions of the courts are urged as decisions that the feeding arrangement of Wilson and the feeding arrangement of Bachelder do not interfere with each other, and consequently that the use of the feeding arrangement of Wilson cannot infringe the Bachelder patent. But this is not a logical conclusion from what was decided in the cases referred to. All that was decided in those cases was, that the claims of the Wilson patents covered inventions which were not to be found in the Bachelder patent—inventions beyond anything found in the Bachelder patent, being the inventions claimed in the Wilson patents; but there was no decision that a machine constructed according to the descriptions contained in the specifications of the Wilson patents did not embrace inventions claimed in the Bachelder patent. No such decision could have been made, because no such question was involved. The principle properly applicable to the decision of the question involved in the present motion is a familiar one in the patent law. Bachelder had no right to use Wilson's improvements without Wilson's consent. Wilson, on the other hand, had no right, in constructing a machine containing his own improvements, to embody therein the improvements patented by Bachelder without Bachelder's consent.

Nothing is shown which anticipates Bachelder's inventions on the point of novelty. The plaintiff's title and the validity of his claims are free from doubt and have been established, and the infringement by the defendants' machine is clear.

An injunction must issue on all the claims.

APPLICATIONS FOR EXTENSION.

Applications have been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,590.—Defecating and Clarifying Cane-Juice.—Granted to RICHARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 2, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,408.—Composition for Kindling Fire.—Granted to ELISABETH BELLINGER, December 13, 1859, and reissued August 7, 1866. Application filed September 15, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,410.—Seed-Planters.—Granted to WILLIAM BLESSING, December 13, 1859. Application filed August 27, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,454.—Dispensing with Switches on Railroads.—Granted to WILLIAM WHARTON, Jr., December 13, 1859, and reissued April 3, 1860. Application filed September 13, 1873. Testimony closes November 11, 1873. Hearing November 26, 1873.

26,475.—Breech-Loading Fire-Arms.—Granted to BETHEL BURTON, December 20, 1859, and reissued December 21, 1869. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 12, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,486.—Pipe-Molding.—Granted to JOHN FERTH and JOHN INGHAM, December 20, 1859, and reissued April 28, 1863. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,487.—Screw-Taps.—Granted to WILLIAM and ROBERT FOSTER, December 20, 1859. Application filed September 18, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Trap.—Granted to JAMES A. LOWE, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,518.—Nail-Plate Feeder.—Granted to JOHN NEWELL, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KIMBALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,582.—Harvesters.—Granted to JOHN GORE, December 27, 1859, and reissued January 15, 1861. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to JONATHAN P. GROSVENOR, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to SAMUEL LEEDS, December 27, 1859. Application filed September 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Porous Ware.—Granted to BRADFORD S. PIERCE and MASON B. PIERCE, December 27, 1859. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to BENJAMIN F. STURTEVANT, December 27, 1859. Application filed September 25, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,674.—Clothes-Driers.—Granted to B. B. HAWES, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to FRANCIS C. LOWTHROP, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,808.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 20, 1869. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,822.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,860.—Machines for the Manufacture of Tinware, granted to SAMUEL J. OLMSTED, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,906.—Stitches.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROBERT O. MELDRUM and AMOS B. PAXSON, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860; and reissued August 1, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,942.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,952.—Lamps, granted to GEORGE NELSON, January 24, 1860. Application filed October 18, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOSHINSKY, January 31, 1860, and reissued March 26, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,023.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTLER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,043.—Lock for Umbrella-Stands.—Granted to ALFRED M. FOOTE, February 7, 1860. Application filed November 8, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,094.—Machine for Making Cartridge-Cases.—Granted to ETHAN ALLEN, February 14, 1860, and reissued May 9, 1865, in two divisions, numbered, respectively, 1,948 and 1,949. Application filed November 11, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,135.—Sugar-Cutters.—Granted to CHARLES KIESLER and WILHELM ROSENBROCK, February 14, 1860. Application filed November 13, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,139.—Hanging Rudders.—Granted to JOSEPH P. MANTON and HENRY A. BILLINGS, February 14, 1860. Application filed November 10, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,179.—Marking-Gages for Sewing-Machines.—Granted to CALVIN D. WHEELER, February 14, 1860. Application filed November 14, 1873. Testimony closes January 13 1874. Hearing January 28, 1874.

27,185.—Soldering-Irons.—Granted to ABNER BURBANK, February 4, 1860. Application filed November 8, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 26, 1860; and reissued August 4, 1868. Application filed October 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOFT, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

30,467.—Apparatus for Singeing Pigs.—Granted to ABRAHAM and EDWARD M. DENNY, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,262.—Fare-Boxes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

26,006.—Improvement in Corn-Planters, granted to E. C. ALLEN, November 8, 1859.

Claim.—The arrangement of the various parts of the seeding-machine herein described, when the whole are constructed and combined for operation conjointly as and for the purposes in this specification herein set forth.

26,028.—Improvement in Apparatus for the Manufacture of Gas, granted to L. D. GALE, November 8, 1859; reissued March 8, 1870, numbered 3,872.

Claim.—1. The vapor-generator A, filled with hydrocarbon liquids by any suitable means, and provided with a vapor-pipe, *i*, leading into a decomposing-chamber, E, substantially as set forth.

2. The combination, in a hydrocarbon-gas generator, of an inner retort closed at both ends, with a space between it and the inner wall of the outer retort, whereby the hydrocarbon (solid or liquid) is first vaporized in the inner retort, and passes from thence into the space between the retorts to form a fixed gas, substantially as set forth.

3. The combination, in a hydrocarbon-gas generator, of two or more retorts, A^4 A^5 A^6, arranged together with a gas-back or decomposing retort, K, and exhauster L, wherein the retorts A^4 A^5 A^6 vaporise, retort K decomposes, and the exhauster L withdraws the gas, substantially as herein described.

26,030.—Improvement in the Manufacture of Gas, granted to L. D. GALE, November 8, 1859; reissued March 8, 1870, numbered 3,873.

Claim.—The treatment of all solid and liquid hydrocarbons by first converting the volatile portions to vapor at a temperature below a cherry-red heat, and forcing the vapor so generated into contact with a red-hot surface, and instantaneously removing the gas thus generated to prevent destructive decomposition, and thus form a permanent or fixed gas.

26,060.—Improved Machine for Making Box-Joints, granted to JAMES SIMPSON, November 8, 1859.

Claim.—1. The combination of the hollow bit *r*, the cutters *w* and d^2, or their equivalents, operating, as set forth, to form the tenons *a*.

2. In combination with the above, the auger-bit r^2, operating, as described, to form the holes *c* to correspond with the tenons *a*, as set forth.

26,090.—Improvement in Paper-Folding Machines, granted to CYRUS CHAMBERS, Jr., November 15, 1859; reissued August 12, 1873, numbered 5,533.

Claim.—1. A drop-roller, co-operating by direct contact with one of the folding-rollers in feeding the sheet, as specified.

2. The grooved folding-roller H, in combination with the vibrating guides 9 9 attached to the rock-shaft F, for the purpose of registering by a positively-acting mechanism the forward edge of the sheet as it enters the machine, as specified.

3. The curved bars 3, arranged to project beyond the surface of the folding-roller, for the purpose of raising or bearing off the sheet from the folding-roller, as set forth and shown.

4. The folding-blade J hung on eccentrics and moving in an arc around one of the folding-rollers, as and for the purpose specified.

5. The combination of the tapes, rods, and stops, arranged in the manner described, for the purpose of corrugating the sheet and presenting it properly to the action of the folding-blade, as set forth.

6. The bent bars 13 and 22, in combination with the folding-rollers grooved to receive their curved ends, for the purpose of turning or conducting the paper, in the manner stated.

7. The combination of the bent bars with the straight bars and adjustable stop, arranged substantially in the manner described.

8. The combination of the bent bars with the tapes and stop for the purpose specified.

9. The combination of the oscillating gate with the packing-box, provided with a yielding slide, and having the rear edge of its bottom board rounded, in the manner and for the purpose set forth.

26,097.—Improvement in Electro-Magnetic Telegraphs, granted to MOSES G. FARMER, November 15, 1859; reissued December 10, 1872, numbered 5,181.

Claim.—1. The combination of a circuit-preserving key with an electro-magnet having two coiled wires on each limb of the electro-magnet, or with two electro-magnets to operate upon one and the same armature-lever.

2. In an instrument for double transmission, the combination of an electro-magnet, or its equivalent, with the continuity-preserving key when the arrangement is such that said key can be operated by an independent circuit, either main or local, which has included in it either a finger-key or any other well-known circuit-closing device for operating it, substantially as represented in Figs. I, VI, and VII of the drawing.

3. The combination of a rheostat or adjustable shunt with a receiving-instrument, so arranged that any desired portion of the current upon the main-line wire can be allowed to pass through the receiving-instrument.

4. The combination of a circuit-preserving key with an electro-magnet having two wires coiled upon each of its limbs, and with a rheostat or other well-known device for regulating the amount of current which shall flow through one of the coils.

26,135.—Improvement in Portable Pumps, granted to WILLIAM T. VOSE, November 15, 1859; reissued February 26, 1861, numbered 41, (whole No. 1,146.)

Claim.—The combination of a foot-stand, stirrup, or rest, as set forth, with a pump-barrel, in manner substantially as described.

26,136.—Mode of Advertising, granted to EDWARD WIEBÉ, November 15, 1859.

Claim.—The above-described mode of exhibiting advertisements, when operated automatically, substantially in the manner set forth.

26,139.—Improvement in Pumps, granted to WILLIAM WRIGHT, November 15, 1859.

Claim.—1. The construction of the pump, by the application of an auxiliary barrel to the working or bucket barrel, and connecting both barrels by a double-beat valve, thus effecting a combined opening through the auxiliary and the bucket valves, with a minimum lift of said valves greater than the area of the pump itself, and obviating, to a great degree, the frictional resistance that would be produced by passing all the water through the pump-bucket valves alone, preventing all throttling, and permitting the engine to work more regularly and economically, substantially as described.

2. The placing of one pump above the other, when made as above described, and connecting both together, and passing the load of one through the working and auxiliary barrels, and the bucket and auxiliary valves of the other, and vice versa, thus allowing the engine to have complete control over the column of water, substantially as described.

26,145.—Improvement in Cocks for Water-Closets, granted to DARIUS WELLINGTON, November 15, 1859.

Claim.—The employment or use of the valve *b* and plunger B, connected by the stem *c*, placed within a suitable cylinder, A, and arranged relatively with the supply and discharge pipes D E, to operate as and for the purpose set forth.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date November 11, 1873.]

6,987.—Drinking-Glasses, &c.—THOMAS G. COOK, Philadelphia, Pa. Application filed March 7, 1873. Term of patent 7 years.

6,988.—Cellarette.—ADOLPH S. ELLISON, New York, N. Y. Application filed October 30, 1873. Term of patent 3½ years.

6,989.—Printing-Types.—HERMAN ILSENBURG, New York, N. Y., assignor to DAVID WOLFE BRUCE, same place. Application filed July 17, 1873. Term of patent 14 years.

6,990.—Printing-Types.—HERMAN ILSENBURG, New York, N. Y., assignor to DAVID WOLFE BRUCE, same place. Application filed July 17, 1873. Term of patent 14 years.

6,991.—Oil-Cloth.—HENRY KAGY, Philadelphia, Pa., assignor to THOMAS POTTER, SONS & CO., same place.—A. Application filed October 9, 1873. Term of patent 3½ years.

6,992.—Oil-Cloth.—HENRY KAGY, Philadelphia, Pa., assignor to THOMAS POTTER, SONS & CO., same place.—B. Application filed October 9, 1873. Term of patent 3½ years.

6,993.—Oil-Cloth.—HENRY KAGY, Philadelphia, Pa., assignor to THOMAS POTTER, SONS & CO., same place.—A. Application filed August 8, 1873. Term of patent 3½ years.

6,994.—Oil-Cloth.—HENRY KAGY, Philadelphia, Pa., assignor to THOMAS POTTER, SONS & CO., same place.—B. Application filed August 8, 1873. Term of patent 3½ years.

6,995.—Picture-Frames, &c.—JOHN NONNENBACHER, New York, N. Y. Application filed September 19, 1873. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date November 11, 1873.]

1,522.—Gold Pens.—CALVIN M. FISHER, New York, N. Y. Application filed November 1, 1873.

"two pens crossing each other at the middle, with the letters 'P. G. Q-P.' in the angles."

1,523.—Clothes-Wringing Machines.—HALEY, MORSE & CO., Boston, Mass. Application filed November 6, 1873.

"'Novelty.'"

1,524.—Ice.—KNICKERBOCKER ICE COMPANY, New York, N. Y. Application filed November 3, 1873.

"'Rockland Lake Ice.'"

1,525.—Thermometer-Tubes.—THE BUFFALO DENTAL MANUFACTURING COMPANY, Buffalo, N. Y. Application filed September 24, 1873.

"a red stripe extending along the back of the white ground commonly employed in the thermometer-tubes."

1,526.—Watches.—THE NATIONAL WATCH COMPANY, Elgin, Ill. Application filed November 6, 1873.

"B. W. Raymond.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date November 11, 1873.]

ORIGINAL PATENTS.

144,379.—Railway-Switch.—FINELLA M. ALEXANDER, Washington, D. C., administratrix of JOSEPH BELL ALEXANDER, deceased. Application filed February 6, 1872.

The switch is actuated from the train by means of a shifting roller-arm mounted on a vertical axis so as to be turned to the right or left at will of the engineer. This operates an oscillating frame extending between the rails for some distance in advance of the switch, which frame depresses the switch-connection on one side, and brings it into use on the other, the same being held firmly in position by the flanges of the wheels operating on the locking pieces L L'. The hand switch-levers are used to change the switch without interfering with its automatic action. The switch-connections are sometimes journaled to the rocking frame instead of being rigidly attached thereto.

Claim.—1. The right and left locks or guard-rails L L', independently journaled, and operated, in concert with the switch-rails C C', by the rocking of the bed-frame A B B, substantially as described and represented.

2. The hand-switches shown in Figs. 3 and 4, for independent action on the switch-rails, without affecting the control of the same by the engineer of a subsequently-approaching train.

3. The switch-rails C C', arranged to oscillate on the supporting-bars B B, as shown in Fig. 6.

4. In combination with the oscillating frame A B E E' and switch-rails C C', the arm *a*, mounted on a vertical axis in bearings *d d*, and adjustable in the manner shown, so as to place the roller *c* on either rail E or E', as required.

144,380.—Can for Fruit, &c.—MELLEN BRAY, Newton, Mass. Application filed October 11, 1873.

The V-shaped groove is formed to serve as a guide for the knife to cut the can, and the top is so formed that after it has been severed from the can it can be turned over and again be used as a cover.

Claim.—1. A metallic can, for hermetically sealing fruits or other substances, having the V-shaped groove B' formed in and extending around the vertical wall of the can near its top end, substantially as described.

2. A can, for hermetically sealing fruits or other substances, provided with the ring B of thinner metal of the same kind as the body of the can, and having formed therein the groove B', substantially as described.

3. The cover C, having its center portion of a diameter to fit the interior diameter of the inwardly-projecting rib formed in the body of the can A or ring B, raised or struck up, substantially as described, for the purposes specified.

144,381.—Bench-Plane.—WILLIAM H. BROWN, Worcester, Mass., and DAVID F. WILLIAMS, Woonsocket, assignors to BAILEY TOOL COMPANY, Woonsocket, R. I. Application filed April 12, 1873.

The set of the cutting-bit and the adjustment of the cap are regulated by set-screw F and a cam which holds the bending-plate.

Claim.—1. In a bench-plane of the character described, an adjusting-screw, F, working in an ear, *c*, formed on or attached to the cap, combined with the presser-plate B, provided with the grooved head *b*, substantially as and for the purpose set forth.

2. The eccentric A, presser-plate B with lugs *e e*, grooves *f f*, and set-screw *d*, in combination with the cap or plane-iron.

3. The presser-plate B, with lugs *e e*, in combination with cap C *e*, set-screw F, and grooves *f f*, substantially as described.

144,382.—Reed-Organ.—RILEY BURDETT, Erie, Pa. Application filed July 26, 1873.

The back set or sets of reeds are dispensed with to make room for the sounding-board of the steel vibratore.

Claim.—1. The sounding-board C, in combination with the steel bar G, steel vibrators, jack F, cam D, and dog E, or their equivalents, for the purpose specified.

2. The combination of the socket-board B with the reed-board I and reed-seats J J, when said parts are arranged substantially as described.

144,383.—Saw-Sharpening Machine.—THOMAS M. CHAPMAN, Old Town, Me. Application filed June 6, 1873.

The clamping-jaw is swung vertically, clear of the saw. Friction-rollers are attached to each jaw, those on the stationary jaw being operated to advance the saw, without removing it from the vise, by means of a foot-treadle and intermediate gears.

Claim.—1. In combination with the stationary jaw *c*, the vertically-swinging jaw *f*, attached to the arm *e*, and clamped to the jaw *c* by the set-screw *g* on the end of said arm, substantially as set forth.

2. The feeding devices, as set forth—to wit, the friction-rollers *i i i*, feeding-rollers *h h*, with their shafts and gears *l n* and shaft *m*, bevel-gear, and shaft *p*, connecting them with the loose treadle *q*, whereby motion is transmitted to said rollers, all arranged as herein set forth, for the purposes described.

3. The combination of the feeding devices with the swiveling standard, as described.

144,384.—Calendar-Clock.—CHARLES M. CLINTON and LYNFRED MOOD, Ithaca, N. Y. Application filed May 8, 1873.

The time-movement and calendar are connected by a pinion which shifts axially, and has a crown-ratchet forming part of a clutch, so that they may be set independently. The day-dial is semicircular, with two concentric rows of figures, to which the long and short opposite arms of a single hand point respectively and alternately. Hour and month indicators are attached to the setting mechanism of the calendar.

Claim.—1. The detaching pinion *c*, arranged between the time-movement and the calendar-movement, substantially as set forth.

2. The wheel *c*, knob *d*, arm or cam *c''*, and spring *c'*, in combination with the detachment ratchet *c*, whereby, by a key or equivalent means, we adjust, either backward or forward, the calendar independently of any motion of the time-movement, substantially as set forth.

3. The setting disk or wheel *f*, for the purpose of setting the calendar to the clock at any hour of the day, as described.

4. The stationary or revolving disk *o*, with numbers on it for four years, and a pointer, *q*, either revolving or stationary, when used in combination with the spring-ratchet *e*, for the purpose of setting the calendar to the right year in reference to leap year by the winch on the shaft of the cog-wheel *s*, or equivalent revolving means, substantially as set forth.

5. The dial *k*, arranged with two rows of figures, as described, and its pointer *j*, when made with one long and one short arm, and operating as set forth.

144,385.—Combined Lunch-Box and Shopping-Bag.—CHARLES C. COBLEIGH, Brighton, Mass. Application filed August 4, 1873.

A lunch-box having several receptacles that can be inclosed, and fitting in a bag that can be used for other purposes.

Claim.—A lunch-box and shopping-bag, consisting of the rectangular bag E, the box A, the food-receptacles C D, and the receptacle B for liquids, separated by the removable partition *e*, all constructed and arranged substantially as and for the purpose set forth.

144,386.—Car-Coupling.—CHARLES C. CONVERSE, Erie, Pa. Application filed July 14, 1873.

One of the coupling-pins is pivoted to the top of the draw-head, and the other to the cross-bar. The cross-bar is pivoted in one side of the draw-head, so that by raising it the lower pin is released, or by depressing it the upper one is allowed to swing out of the draw-head. The coupling is automatic, as the pins are free to swing backward when struck by the link.

Claim.—The combination, in a draw-head, A, of the pins B B', and pivoted cross-bar C, substantially as described.

144,387.—Clothes-Line Reel.—GEORGE F. CORLISS, Mansfield, Ohio. Application filed September 24, 1873.

In a casing is journaled a wheel for a cord and weight, and a rack or reel for the line, the cord of the wheel winding on the reel, with a strip to bear the line onto the reel, and a pipe for it to pass through the casing.

Claim.—The combination of the wheel D, shafts E and F, cord *d*, rack H, pipe *x*, and strip M, when arranged and operated substantially in the manner and for the uses and purposes shown and described.

144,388.—Head-Block.—PERLEY M. CUMMINGS, Lyons, Iowa. Application filed September 12, 1873.

The devices for moving the setting-knees are adjusted so as to operate them individually or simultaneously.

Claim.—1. In saw-mill head-blocks, the feed-bar, composed of the parts A, A^1, and A^2, in combination with head-blocks E, all constructed, arranged, and operating in the manner described.

2. The arrangement and combination of the quadrant-plates D D, feed-bar in parts A A^1 A^2, guides C C′, levers *d d′*, and connecting-bars *e e*, substantially as and for the purpose specified and described.

144,389.—Railway-Car Truck.—JESSE DARLING, Whistler, Ala. Application filed August 31, 1872.

The wheels revolve upon fixed axles, secured at each end to spring-seats, each wheel being provided with two pipe-boxes inserted from each end of the hub around the fixed axle. Springs are inserted between the seats at the ends of the axles and pedestals attached to the frame of the car.

Claim.—The combination, in a railroad-car, of the frame A B, pedestals C, springs D, spring-seats E, fixed axles G, and wheels H, all constructed and arranged substantially as shown and described, and for the purposes set forth.

144,390.—Air-Compressor.—HORACE H. DAY, New York, N. Y. Application filed March 21, 1873.

The cylinder is composed of an outer and inner shell, having a water-way between them divided by a spiral brace and cross-bars or lugs, to secure as great agitation of the water as possible.

Claim.—The water-way, Fig. 2, the cross-bars or lugs, Fig. 5, the spiral brace or flangee, which connect the outer and inner shell, in combination, when used in cylinders for compressing or working off air or other aeriform bodies, the whole united and operated in the manner set forth.

144,391.—Cradle.—CHARLES A. FENNER, Mystic River, Conn. Application filed April 7, 1873.

A cradle constructed with ends connected by diagonal stripe, loosely riveted to allow easy play, in form of lazy-tongs, with its bottom pivoted to cross-pieces to allow it to contract in folding, by which it may be opened for use or contracted into a small space for transporting. The connection on its upper side is by links, by which the ends are given a sloping form.

Claim.—1. The links E^1 E^2, connecting the ends A^1 A^2 with the latticed sides B C, arranged as shown, so that as the parts are closed together the ends will approximate a parallel position, and as they are extended the ends will assume an inclined position, as specified.

2. The grooved cross-pieces M m, in combination with the bottom lattices G H, side lattices B C, and the connected ends A^1 A^2, adapted to serve as herein specified.

144,392.—Grave-Mound Cover.—BENJAMIN HUNTER, Philadelphia, Pa. Application filed October 21, 1873.

To prevent the mound washing away and sinking from rains.

Claim.—A grave-mound cover having a groove or gutter, C, around its lower edge, and provided with one or more outlets, *a*, substantially in the manner and for the purpose set forth.

144,393.—Steam-Boiler Furnace.—SAMUEL KEYES, Bennington, Vt. Application filed June 7, 1873.

Claim.—The combination of a horizontal boiler, A, fire-chamber B, fire flue C, surrounding the boiler, sheet-like space I over the flue C, chamber M under the fire-chamber, and passages *e* and *k k* for directing external air into and through the space I, and thence into the chamber M, substantially as described.

144,394.—Cotton-Opener.—RICHARD KITSON, Lowell, Mass. Application filed April 7, 1873.

For preventing cotton being forced down between the bars with the dirt and waste, and for reducing the volume of air which is produced when such air-ports are located above the beater and near the feed-rolls.

Claim.—In a cotton-lapper, such as herein described, air-ports A forward of the beater and the rack, as specified, and opening into a space or compartment communicating with the beater through the spaces between the forward bars of the rack, all in the manner and for the purpose set forth.

144,395.—Shuttle for Sewing-Machines.—JOHN KNOX, Three Rivers, Mich. Application filed July 21, 1873.

By arranging the bearing-cap at the hinged end of the thread-guide the bobbin is held securely and easily against any possibility of displacement.

Claim.—The combined thread-guide and latch, when the cap-block *c* is arranged adjoining the hinge, in combination with a retaining-notch, *f*, to receive the extremity of the arm, as set forth.

144,396.—Compound of Bitumen, Ore, &c.—PEYTON LEA, Goliad, Tex. Application filed January 8, 1872.

About ten per cent. of bitumen, finely divided, is suspended in twenty-four per cent. of water; to this sixty-six per cent. of pulverized ore is added. The mass is treated by compression and evaporation to remove the water, the result being a dense compound of bitumen, ore, &c.

Claim.—The new compound of bitumen and ore, or ore with its admixtures as found in natural deposits, or these with metallic substance added thereto when necessary, the proportions of the solid pulverized ore, or pulverized and granular material and with the bitumen, being about as specified, and the compound being as and for the purpose set forth.

144,397.—Mixing Mineral and Fossil Substances with Bituminized Clay to Form a Plastic Material.—PEYTON LEA, Goliad, Tex. Application filed February 24, 1872.

Bitumen and water are thoroughly mixed, and then metallic ore is pulverized and embedded in the mixture. The water is now expelled by evaporation, and the mass is made compact by pressure.

Claim.—The new compound or product of bitumen, clay, and mineral or fossil substances, or both fossil and mineral substances, the proportions of the bitumen and of the firm materials being about as set forth.

144,398.—Machine for Cutting Cobble-Stones.—HEZEKIAH LOMBARD, JOSEPH P. MORRILL, and LEROY A. SWEATT, San Francisco, Cal. Application filed March 15, 1873.

Claim.—The combination of pivoted head B and stationary bed A, provided with cutters E E, held apart by an intermediate spring, F, and operated as and for the purpose described.

144,399.—Key-Cap for Key-Beard Instruments.—JOHN P. LORD, Manchester, N. H. Application filed May 5, 1873.

The porcelain, glass, or other cap has flanges at each end, in which fit projections made upon the key for the purpose of fastening the same without relying entirely upon cement.

Claim.—1. The method of uniting the caps A and A A with their respective keys E and E′ by means of the dovetails L D and C B, substantially as described and shown.

2. The combination of the ornamented glass or crystal caps A and A A, constructed as described, with their respective keys E and E, substantially as herein described, and for the purpose set forth.

144,400.—Mold for Oil-Cakes.—RICHARD MACDONALD, Hull, England. Application filed October 29, 1872.

The metal plates which form the molds are provided with canvas flaps, and also with flanges around their edges, formed of hair or grass rope.

Claim.—1. The mold A, constructed as described, with rope flanges C, as and for the purpose specified.

2. In combination with an oil cake mold, constructed as described, the canvas laps B B, as and for the purpose specified.

144,401.—Machine for Pointing Staples.—WESLEY MALICK, Erie, Pa. Application filed September 16, 1872.

Two horizontal swages and a bifurcated or double vertical swage, combined with a swage-block having a rib across its face that converts it into two anvils, each with a horizontal and a vertical face, which co-operate with the several hammers, the faces of the hammers and anvils being properly inclined in pointing both limbs of the staple at the same time.

Claim.—1. The anvil G, when constructed with the faces I I and J J, and used for the purposes shown and described.

2. The combination of the two-sided and double-faced anvil G with the reciprocal and convergent hammers F E E, for the purposes shown and described.

144,402.—Stair-Rail-Molding Machine.—JOHN B. MARSHON, Swampscott, Mass. Application filed January 15, 1873.

The rail is retained in its proper position with relation to the rotating cutter by a series of changeable feed and guide rolls.

Claim.—1. The combination and arrangement of the wheels *d e d*, support *e″*, feed-roller *f*, support *g*, and wheel *h*, substantially as and for the purpose above described.

2. The combination and arrangement of the shaft *b*, upright *d′*, cutter *c′*, wheel *h*, and support *g*, substantially as and for the purpose hereinbefore specified.

3. The combination and arrangement of the support *e″*, wheel *p*, upright *d″*, and feed-roller *m*, substantially as specified.

4. The combination and arrangement of the wheel *n*, feed-roller *m*, brace *l*, and upright *d′*, substantially as hereinbefore set forth.

144,403.—Coating Iron and other Metals with Protecting Alloys.—CALEB MARSHALL, Philadelphia, Pa. Application filed October 21, 1873.

The object of this invention is to coat sheet-iron and articles of iron with a cheap alloy, which will protect the iron against corrosion without injuring its strength.

Claim.—1. The improved alloys herein described for coating sheet-iron and other articles, composed of lead, tin, and copper, substantially in the proportions named, either alone or with the addition of zinc, or of zinc and antimony, as set forth.

2. As a new article of manufacture, sheet-iron, or other article of metal, as specified, coated with an alloy of lead, tin, and copper, with or without the addition of zinc, or zinc and antimony, substantially as specified.

144,404.—Match-Box.—JOSEPH MATTHIAS, New York, N. Y. Application filed October 18, 1873.

The hinges are so made as to allow movement at a right angle to their axes so that the cover can be pushed down over the upper portion of the body.

Claim.—The sliding or adjustable hinge *b b c c*, constructed substantially as described, and for the purposes set forth.

144,405.—Medical Compound or Salve.—DENNIS J. MCEVOY, Charlestown, Mass. Application filed October 23, 1873.

Hog rind, one-half pound; lard, one-half pound; bees-wax two ounces; rosin, one ounce; sugar, one tea-spoonful; potash, one-half tea-spoonful; leather burned to dust, one-half ounce.

Claim.—A salve composed of the within-named ingredients, compounded substantially as set forth.

144,406.—Miter-Box for Cutting Printer's Rules.—THEODORE H. MEAD, New York, N. Y., assignor to R. HOE & Co., same place. Application filed March 6, 1873.

Claim.—The combination, with the box A, provided with longitudinal grooves *a* and slits *b*, *c*, and *d*, of the clamping-plates and screw D B C, constructed and operating substantially in the manner described.

144,407.—Nail-Distributer.—ALEXANDER MORRISON, Harrisburg, Pa. Application filed September 17, 1873.

The oscillating chute P is pivoted at S to the end of the stationary chute M, and is formed so as to coalesce with said chute when it is desired to receive accepted work, and is operated by means of the trip mechanism, so as to reject or receive a spike, at the option of the operator.

Claim.—1. The arrangement of the transverse articulation of the parts M P of the compound chute directly beneath the forward end of the exit-opening leading from the dies of the spike-machine, substantially as and for the purpose herein shown and described.

2. The trip mechanism composed of the connecting-rod G, the operating-lever G′, the coiled spring K K′, or its equivalent, in combination with the oscillating chute P, these parts being arranged to operate conjointly, substantially as and for the purpose set forth.

3. The combination of the chute P, connecting-rod G, lever G′, plunger D D′, and sheath E, or its equivalent, all constructed and arranged to operate as and for the purpose herein set forth and described.

4. The oscillating chute P, in combination with the shield T, for the purpose herein set forth.

144,408.—By-Pass for Gas-Works.—PETER MUNNINGER, Philadelphia, Pa. Application filed September 16, 1873.

The invention is for correcting any inaccuracies in the working of the exhauster used for pumping the gas from the retorts, and consists of an automatically-acting valve placed in the shut-off or valve of the by-pass.

Claim.—A by-pass in combination with an automatic valve, arranged to close when the pressure of the gas in the forcing-pipes G exceeds the pressure in the suction-pipes E, and to open when the pressure of the gas in the suction-pipes E exceeds that in the forcing-pipes G, for the purpose shown and described.

144,409.—Reed-Organ Reed.—MOSES O. NICHOLS, Clyde, Ohio. Application filed July 5, 1873.

The reed frame or block being made of wire bent round at the point, the wind-current vibrating the reed has a smooth and rounded channel.

Claim.—1. The reed-block A, formed of bent wire, substantially as and for the purpose described.

2. The wire reed-block A, in combination with the heel-plate B, substantially as described.

3. The wire reed-block A, in combination with the heel-plate B and tongue C, when constructed substantially as described.

144,410.—Steam-Brake for Railway-Cars.—NILS NILSON, Minneapolis, Minn., assignor to himself and WILLIAM W. MCNAIR, same place. Application filed December 17, 1872.

A main and auxiliary cylinder are combined with the brake-levers and suitable operating devices, so that the steam first enters the auxiliary cylinder. A spring around the rod of this cylinder withdraws the piston, and the steam is let out of the main cylinder by a valve in the head thereof. A universal joint connects the pipes and allows lateral and horizontal motion. A coupling with hooks and screw-wheels connects the pipes between the cars.

Claim.—1. The combination of the steam-supply C, cylinders B and B′ and their operating devices, as herein described, with the brake-bars 8 and brakes 9, constructed and arranged to operate in the manner and for the purpose substantially as described.

2. The joints H and I, Fig. 4, constructed as described, to allow of lateral and longitudinal motion, in the manner as set forth.

3. The coupling, Fig. 5, composed of hooks *b″*, screw-sleeve wheels *a″*, coupling-pipe *f‴*, in combination with the steam-pipes *f′*, substantially as and for the purpose described.

144,411.—Tenoning-Machine.—JOHN RICHARDS, Philadelphia, Pa. Application filed October 16, 1873.

The cutters are carried upon a vertical spindle affixed to a horizontally-sliding frame, between two tables upon which the lumber to be operated on is placed.

Claim.—The combination of a sliding frame, *m*, with a vertical spindle, *d*, and the two tables F F in a wood-tenoning machine, arranged and operating substantially as hereinbefore specified.

144,412.—Car-Coupling.—LEMAN P. RIDER, Pittsburg, Pa. Application filed May 26, 1873.

The pin is prevented from accidental displacement by a cap, *r*, which fits over its trunnions. The link-guide is pivoted to the draw-head, and so connected with the levers for operating it from the side of the car that they will not interfere with the longitudinal play of the draw-head.

Claim.—1. The pin *c*, having the arm c^1 and journals *c*, in combination with the ledge *c′* on the draw-head, and latch *r*, substantially as set forth.

2. The U-shaped lifter *f*, with one side or arm of the U projecting back and passing loosely through the loop A^1 in the lever A, and the loop *i*, all combined substantially as set forth.

3. The pin *c* and the latch *r*, connected by means of a chain, *s*, so that when the pin is withdrawn by means of the chain *c′* the latch will be opened to permit its escape, all combined substantially as set forth.

144,413.—Window-Ventilator.—LUTHER ROBINSON, Newton, Mass. Application filed September 9, 1873.

The ventilator is in two compartments, and has a roof which deflects the current from an upward direction, and a diffusing-plate to prevent a direct draft.

Claim.—1. The spreading-plate *g*, in the position described, in combination with the floor *a*.

2. A window-ventilator combining, with the floor *a* and plate *g*, a top or roof which acts as a partial obstruction to the ascent of the air, substantially as specified.

3. The arrangement, with the ventilator *e g h*, of the partition *k*, substantially as and for the purpose hereinbefore set forth.

144,414.—Apparatus for Heating and Illuminating.—LAURENT RUEL, St. Johnsbury, Vt., assignor to himself and JULIEN DEMERS, same place. Application filed August 6, 1873.

Upright ribs, at their lower ends, are clasped by a ring to the collar of a lamp, and at their middle steady a glass chimney, and at their upper ends support a horizontal ring which both holds the vessel when contents are to be heated, and steadies a flanged metallic chimney, which rests on the glass chimney and projects upward through a central orifice in the boiler.

Claim.—The clasp F, the series of rods E E E E, the shelf D, the main and auxiliary chimneys B C, and the burner *b*, arranged and combined substantially as shown and described.

144,415.—Garden-Hose Rest.—CHARLES RYDER, Cambridgeport, Mass., assignor to himself and HENRY G. WHITE, same place. Application filed August 6, 1873.

A spout is hinged to and made vertically adjustable upon the rotary head of a tripod by means of a horizontal rack-bar and strut or pawl. The hose is placed in the spout and secured in place by a pin, when it can be changed to any elevation and directed to any point at will.

Claim.—1. The combination of the spout A, the forked rack B, the strut E, the rotary head C, and the tripod D, arranged and applied together substantially as specified.

2. The belaying or supporting rod or bar *d*, arranged and combined with the spout A, the rack-bar B, the strut E, the rotary head C, and the tripod D, all being applied together and for use in manner and for the purpose as set forth.

144,416.—Rotary Puddler.—WILLIAM SELLERS, Philadelphia, Pa., and GEORGE H. SELLERS, Wilmington, Del. Application filed September 3, 1873.

The gearing is so constructed that the rotary puddler can be arranged to swing either to the right or left, as may be most convenient or rendered necessary by location. A double-cylinder steam-engine is mounted on the traversing frame, and, by intermediate gearing, is used to rotate the puddler or vibrate the traveling frame, as is desired.

Claim.—1. As an improvement in the art of mechanical puddling, the hereinbefore-described method of spreading the charge during ebullition.

2. As an improvement in the art of mechanical puddling, the method, substantially as herebefore set forth, of rotating the vessel, when charged, by the same power which, when it is to be charged or discharged, separates it and the fluee.

3. As an improvement in the art of mechanical puddling, the hereinbefore-described method of locking the traversing frame when the puddling-vessel is against the flues.

4. As an improvement in the art of mechanical puddling, the hereinbefore-described transposable arrangement of parts, so that the puddling-vessel may be traversed to the right or left, as required.

5. A cylindrical puddling-vessel open at one end only.

6. The combination, with a rotary puddling-vessel, of a water-back, substantially as described.

7. The combination, with a rotary puddling-vessel and a water-back, of a hollow journal, through which the water is admitted and discharged.

8. The combination of the water-back, the hollow journal, the ping *h′*, and pipe *h*, for the purposes described.

9. The combination of the rotary puddling-vessel, the water-back, the hollow journal, the waste-pipe i^3, and basin i^2.

10. The combination, with the traversing frame G and the radial wheel I, of the supporting-frame J J, substantially as and for the purposes described.

11. The radius-bar *m*, connecting the supporting-frame J J with the traversing frame G, substantially as described.

12. The eccentric shaft *m′* *m′* and lever *n′*, in combination with the wheels *n n*, for the purposes described.

13. The shaft N′, common to the respective systems of gearing, for rotating the puddling-vessel A, and for traversing the frame G, substantially as described.

14. The combination of a rotary puddling-vessel, a traversing frame, and a system of pipes jointed in the axis of vibration of the frame, for the purpose described.

15. The combination, with a rotary puddling-vessel and the traversing frame, of the platform r^6, for the purpose described.

16. The combination, with a rotary puddling-vessel, of a discharging-fork swinging about two centers in a line parallel to the axis of the puddling-vessel, substantially as described.

17. The combination, with a rotary puddling-vessel, of a discharging-fork swinging about two centers, one end moving only in a horizontal plane, the other having both a vertical and horizontal movement, substantially as described.

18. The combination, with a rotary puddling-vessel, of a discharging-fork having a flexible support at one end and a universal joint at the other, substantially as described.

19. The combination, with a rotary puddling-vessel, of a discharging-fork having a flexible support at one end and a universal-joint support at the other, so that the fork may be turned upon its axis, substantially as described, and for the purposes set forth.

20. The handle c^4, located and arranged substantially as described, so that the various movements of the fork may be managed from one and the same point, substantially as set forth.

144,417.—Baking-Pan.—CHARLES T. SMITH, Jersey City, N. J. Application filed January 23, 1873.

To the upper edge of the sheet-metal bake-pan is secured a cast-iron rim, having a square shoulder on the inside in which the cover fits.

Claim.—As a new article of manufacture, the pan *a*, having secured to its top the cast-iron rim *b*, having a square shoulder formed around its inside, so as to receive the cover, substantially as specified.

144,418.—Ironing-Table.—WILLIAM H. SPARKS, Absecom, N. J. Application filed October 11, 1873.

The table has two sets of crossed legs, one set being pivoted to one end of the table. The legs are pivoted at the center where they cross each other by metal braces having projecting pins.

Claim.—The braces E E, having projecting pins *e e*, in combination with the pivot-rod C, and the legs B B and B′ B′, for holding the legs in a firm position to support the top A, substantially as described.

144,419.—Rotary Cultivator.—JOHN D. STARRITT, Chicago, Ill. Application filed May 17, 1873.

A series of revolving diggers are mounted upon the rear end of a rectangular frame supported on wheels. Each digger has an independent motion by rotation upon its own axis; besides, the head of the digger is united to its shaft by a universal joint.

Claim.—In a rotary cultivator, the rotary knives F F, constructed and arranged substantially as described, and each having a free, independent, vertically-yielding movement with relation to the other by reason of the attachment of each to a corresponding rotary shaft by means of a universal joint, and by reason of the arrangement of the stems G G in the yokes H H, substantially as and for the purposes specified.

144,420.—Ticket-Case.—JAMES STOKES, Jr., New York, N. Y. Application filed August 5, 1869.

A spring-metal cylinder, divided longitudinally to provide an orifice for the strip-ticket, is at one of the sides of this opening bent into V form to provide an edge over which the ticket is torn off.

Claim.—The ticket-case composed of the cylinder or drum D, mounted upon the arms E, in combination with the spring-case A provided with strip-holding jaws *a b*, all constructed and arranged substantially as and for the purposes set forth.

144,421.—Bridge-Wall for Furnaces.—SETH C. STURTEVANT, Cleveland, Ohio. Application filed July 21, 1873.

A hollow bridge-wall has its front side perforated, and its top open. A plate is arranged in front of the perforated side of the bridge-wall, so as to leave an air-space between them, the object being to consume the gases and smoke.

Claim.—The combination of the chamber or shell A, having a perforated front wall, C, opening D, and plate F, forming, in connection with the side C, an air-space, H, in the manner as and for the purpose specified.

144,422.—Faucet.—SAMUEL R. THOMPSON, Portsmouth, N. H. Application filed August 25, 1873.

A perforated plunger, fitting into the end of the faucet-barrel, is employed to drive the plug into the barrel after the said faucet-barrel has been partly inserted.

Claim.—The perforated plunger G, attached to rod F, in combination with a faucet, substantially as and for the purposes set forth.

144,423.—Postal-Card Case.—CHARLES H. TOWNSEND, TWIFORD E. HUGHES, and ALBERT A. KEITH, Minneapolis, Minn. Application filed July 1, 1873.

Claim.—The open postal-card case *d*, constructed with the inner rim A, and provided with the plate F and springs E E′, and having the open end *h*, loops C C′, and flap B, substantially as and for the purpose set forth.

144,424.—Buffet-Table.—WILLIAM H. TUFTS, Lynn, Mass. Application filed August 20, 1873.

The lower board of the cupboard forms the top of the permanent part of the table, and is supported on a three-legged stand. Said stand is provided with two hinged arms or rails, each supported by a leg. This extension forms the support to the hinged folding part of the table-top. When the folding top is raised to an upright position it forms the shelves and top of the cupboard. These shelves are hinged to a connecting-frame, to which front and end doors are attached, and a closed cupboard is formed.

Claim.—The buffet-table, substantially as described, consisting of the stand B, the folding arms C C′, the legs D D, the boards A H I, the frame E, the bars G G, and the front and end doors F and K K, all arranged and combined or applied together in manner and to operate essentially as specified.

144,425.—Railway-Car Heater.—JULES H. WEIBEL, Geneva, Switzerland. Application filed August 23, 1873.

By reason of the provision of branch and return pipes the apparatus has special adaptability to compartment-cars.

Claim.—1. In combination with a heater, the supply-pipe *i* and a series of descending pipes, *k*, located at intervals along the car, and connected by cross-pipes *l* to a return-pipe, *n*, with suitable cocks interposed between the supply and return pipes for regulating or shutting off at will the flow through any or all of the pipes *k*, the whole being constructed and arranged to operate substantially as and for the purpose herein set forth.

2. In combination with the heater, constructed and arranged substantially as described, the tube *d* with its cover *e*, arranged as shown, whereby fuel can be supplied from the exterior of the car, as set forth.

144,426.—Spring-Seat for Wagons and Carts.—PETER WEYAND and PHILIPP HILL, Morrisania, N. Y. Application filed April 21, 1873.

The springs of the seat, when in use, rest upon a rubber bed. The seat, when not in use, may be turned over and rest upon the foot-rest, to be out of the way when loading the wagon.

Claim.—In a wagon-seat, the combination of the support B, post A having shoulder *m*, and rubber block *w* with the springs D E, substantially as set forth.

144,427.—Block-Fitting Machine.—ELIAS H. WOODSUM, South Boston, Mass., assignor to FRANCIS H. WHITMAN, Harrison, Me. Application filed September 8, 1873.

A pair of oscillating circular-saws are arranged, in connection with two vertically-reciprocating augers, so as to cut from a plank, and at the same time bore a block of wood which is to form part of a railway-sleeper.

Claim.—The device, substantially as herein described, by means of which blocks are simultaneously cut and bored, for the purpose herein set forth, and for similar uses.

144,428.—Car-Coupling.—THOMAS ANDRESS, Auroraville, Wis. Application filed July 19, 1873.

When the pin is raised, by means of a chain, the weighted lever, which holds the pin-support forward, is also raised, so that the slide is free to be drawn back by a spring at its rear, which slide carries the pin from over the hole in the draw-head. In coupling, a curved bar on one draw-head strikes a lever pivoted in connection with the slide, and which thrusts it forward so that the pin can fall through. The links are thrust forward out of the mouths of their draw-heads by the arrangement of levers and projections.

Claim.—In car-coupling, the combination of coupling-pin B, chains *a a′*, slide *b*, having rod *d e′* and spiral spring *e*, with guides *d d′* and pivoted levers *f g*, for detaining and dropping pin B, as described.

2. The draw-bar A, having curved bar C and bolster-extension F, with slot *o′*, as set forth.

3. The coupling-link B, combined with links *h i*, pivoted lever E, spiral spring *n*, and rod *o*, as described.

4. The combination of draw-bars A, link and pin mechanism, bars C, and rods *o*, forming the double car-coupling, substantially as and for the purpose described.

144,429.—End-Gate for Wagons.—JOSEPH C. BAIRD and MERRITT MILLER, Heaton, Ill. Application filed August 30, 1873.

Claim.—The end-gate C, provided with the lugs G at one end and engaged between the cleats D E, and having the lever-catch I, at the other other end, the lever being jointed to the side of the end-gate by a link, and provided with hooked prongs M to engage the side board when the catch is fastened, all substantially as specified.

144,430.—Window.—GOTTLIEB M. BARTH, Philadelphia, Pa., assignor to himself and AUGUSTUS SAUER, same place. Application filed September 21, 1872.

The hinged stripe, in conjunction with the movable spring-stripe, enable both sashes to be readily removed and replaced, and the lugs or projections on the balancing device afford a ready means of attachment and detachment.

Claim.—1. The combination of the adjustable strip F and the hinged stripe A and sashes B B′, as set forth.

2. The combination of a sash with lugs or projections *d* secured to the balancing devices, and adapted to notches cut in the edges of the said sash, substantially as specified.

144,431.—Jewel-Case.—CONSTANTIN BECK, Providence, R. I., assignor to GORHAM MANUFACTURING COMPANY, same place. Application filed September 10, 1873.

Claim.—In combination with the parts D and A of a jewelry box or case, the rim or frame B, when made of metal, substantially as and for the purpose described.

144,432.—Automatic Hatchway-Guard.—GEORGE E. BERRY and FRANK C. PINGREE, Detroit, Mich. Application filed September 27, 1873.

A means of automatically opening and closing a hatchway-guard by the passage of the elevator-car. A pin on the car encounters a pivoted lever connected, by cords passing over pulleys, to the guard, thus raising the same. Another pin, somewhat in the rear, engages the opposite arm of the lever as the car passes on, and thus causes the fall of the guard to its place.

Claim.—The vertically-sliding gate B, ropes D, and tilting lever F, combined and arranged with the carriage I, the latter having pins H and L, arranged to actuate said lever, in the manner described.

144,433.—Plow.—JEROME BLANCHARD, East Saginaw, Mich., assignor of one-half his right to H. WALLACE CARTER, same place. Application filed April 5, 1873.

Claim.—The two sets of skeleton-wheels A B, forming the entire mold-board, and used in connection with the bar D, all constructed and arranged as shown, and for the purpose specified.

144,434.—Package of Powder-Charges for Blasting.—HENRY M. BOIES, Scranton, Pa. Application filed October 4, 1873.

A series of charges are arranged in a long flexible tube, and separated by twisting the material, which is covered at the division as the charges are required for use.

Claim.—A cartridge-package, consisting of a series of charges contained in a tube of suitable flexible material, and separated one from another by suitable intervals of space, as shown and described, whereby the charges may be used successively, as required, or individually divided and used in part, as set forth.

144,435.—Implement for Capping Cartridges.—HENRY M. BRONSON, Sandusky, Ohio. Application filed September 27, 1873.

Claim.—The instrument herein described for capping cartridge-shells, consisting of the bolt A A′ and the spring-clamp B, the parts being combined substantially as described.

144,436.—Balloon Advertising.—WILLIAM FRANK BROWNE, New York, N. Y. Application filed October 3, 1873.

The netting or canvas upon which the advertisements are displayed is placed below the balloon, and has a vane attached to it so that its edge will always be presented to the wind, and thus allow the balloon and its attachments to remain nearly perpendicular. The advertising canvas is kept taut by being suspended between the balloon and the anchor-rope.

Claim.—1. A double advertising-surface, B, of canvas or other suitable material, constructed to automatically present its edge to the wind, in combination with a balloon for advertising purposes, substantially as herein specified.

2. The advertising-canvas B, in combination with the balloon A and anchor-rope *i*, forming the connection between the same, substantially as and for the purpose herein specified.

144,437.—Churn.—GEORGE G. BUCHANAN, Cotton Plant, Miss. Application filed June 14, 1873.

A dasher-rod, socketed in a removable top to its frame, carries a pinion near its top, which meshes with gearing. A surrounding flange lower down, moving on a cross-beam, supports the rod, which, passing below, is united to the dasher by a sleeve-connection.

Claim.—A churn-dasher section, H, having a pinion, N, by which it may be rotated, and a flange, J, by which it may be supported, connected detachably with tube G, and with a detachable cap, K, as described, to allow it to be easily removed.

144,438.—Wood Molding.—LEONARD BUSHNELL, New Bedford, Mass. Application filed May 17, 1873.

Claim.—A wooden or other molding provided with stamped ornamental figures or signs in intaglio, having the sides of the recesses beveled and inwardly inclined, substantially as described, to facilitate the operation of gilding, as set forth.

144,439.—Car-Coupling.—REVERE BUTT, Harrisburg, Pa. Application filed August 16, 1873.

The bifurcated pin-support is pushed forward beneath the pin by a sector acting on its rear end. The pin is guided and raised by a poised wheel pivoted on a standard projecting up from the draw-head.

Claim.—1. In a car-coupling, the combination of the gravitating sector H H^1 H^2, pivoted through the draw-head side plates, and the bifurcated sliding frame C D E F to traverse the longitudinal chambers, arranged one above the other in front part of the draw-head A K B, to detain and drop the ordinary coupling-pin Q, and to poise and couple the ordinary coupling-link L, substantially in the manner as and for the purpose set forth.

2. The coupling-pin operating device, composed of the wheel V, overbalanced by projection J, connected by chain G to the coupling-pin Q, and mounted detachably on the fore-part of the draw-head by the post W, all combined as and for the purpose herein set forth.

144,440.—Carriage-Door.—JAMES CARSON, Buffalo, N. Y. Application filed September 10, 1873.

Claim.—The pivoted supplemental pieces *d*, having the protecting-stripe, *f*, in combination with the supports D D, having the hooked ends *g*, combined to operate substantially as and for the purpose specified.

144,441.—Office and Counting-House Stool.—ALFRED DEFOREST CARTWRIGHT, Oakland, Cal. Application filed August 21, 1873.

The spindle that is attached to the under side of the rotary seat is supported on a disk that has several perforations on its upper surface, so that the angle of the seat may be adjusted by placing the spindle end in the different holes.

Claim.—The disk F with its perforations or step G, in combination with the spindle C of the seat E, substantially as and for the purpose described.

144,442.—Tilting-Stand for Carboys.—ABNER W. CAVERLY, New York, N. Y. Application filed August 16, 1873.

The stand upon which the carboy rests is provided with rockers so that it can be tilted sufficiently to pour out the contents.

Claim.—A stand for carboys provided with rockers, so arranged that a carboy resting on the stand can be tilted sufficiently to pour out the contents by turning it on the rockers, but will of itself remain upright with a carboy on it, substantially as specified.

144,443.—Wagon-Brake.—BENJAMIN W. COE, Des Moines, Iowa. Application filed August 30, 1873.

Claim.—1. The combination of the plate *d*, spring *g*, and tongue C, in the manner and for the purposes described.

2. The jointed rod *a a*, coil-spring *b*, and pivoted levers *c c*, combined with the axle A, hounds B B, and tongue C, substantially as and for the purpose described.

144,444.—Polishing Compound.—ELSIE J. COMBS, Plattsburg, assignor of one-half her right to LEVI O. DUNNING, Penn Yan, N. Y. Application filed September 12, 1873.

Fifty pounds soft carbonate of calcia, one and one-half pound hard soap, four ounces aqua ammonia, one pint alcohol and water.

Claim.—The compound for cleaning and polishing metals, glass, or other materials, compounded of the ingredients of soft carbonate of calcia, hard soap, aqua ammonia, alcohol, and water, in about the proportions named, and in the manner substantially as herein set forth.

144,445.—Foot-Warmer.—JOHN B. CRAIG, Perrysville, Pa. Application filed May 5, 1873.

Claim.—The bottom B, having the pins D and ribs G, combined with a block having cavities H to hold said block in the box A, as set forth.

144,446.—Artificial Stem for Cut Flowers.—JOHN B. CRAIG, Perrysville, Pa. Application filed August 26, 1873.

Fine annealed wire is formed into a spiral skeleton cup at the apex for embracing the calyx of the flower, either for single flowers or bouquets.

Claim.—The device A for stemming flowers, consisting of a wire-coil, *a*, and stem *b*, as shown and described.

144,447.—Beer and Ale Faucet.—JOHN DEASEY, Fall River, Mass. Application filed September, 20, 1873.

The barrel-plug is driven in by means of a plunger passing through the faucet-body. Said plunger is restored to its position by the elasticity of a spring. Leakage is prevented by a packing and screw-nut around the plunger at its point of entrance.

Claim.—The combination of the cap C, packing G, collar F, and spring H, with the rod and the tube, substantially as specified.

144,448.—Milk-Cooler.—CHARLES A. DOUGLAS, Franklin, N. Y. Application filed October 18, 1873.

The water-pan of a milk-cooler is protected from the heat of the atmosphere by a non-conducting envelope of felt, paper, or equivalent substance. The water-pan is provided with a wooden flange projecting from the metal flange and resting on the beams, which confines the upper edge of the envelope against the side of the water-pan.

Claim.—1. The water-pan of a milk-cooler protected from the heat of the atmosphere by a non-conducting cover or envelope, C, of paper, felt, or other equivalent substance, substantially as specified.

2. The combination of the wood flange E, metal flange F, pan A, beams G, and the non-conducting cover C, substantially as specified.

144,449.—Machine for Bending Tubing.—WILLIAM T. FARRE, Montreal, Canada. Application filed June 30, 1873.

The two two-winged beaters B are so constructed and arranged that one end of each shall overlap in its action the boundary line of the action of the other, and thus prevent the formation of a fin on the tube that projects from mandrel S over the edge of the die I.

Claim.—In a machine for making curved tubes of soft metal, the combination of the two sets of revolving dies B B′, constructed and operating substantially as and for the purpose specified.

144,450.—Type-Writing Machine.—JOHN GALLOWAY, New York, N. Y. Application filed September 27, 1873.

The paper and transfer-cloth are placed on the cylinder B. The block Q, with raised letters on its under side, is moved along until its arm E is in the notch in the bar S, corresponding to the letter desired to be printed, when it is forced down upon the paper. The pawl M, attached to the rear of the frame J, rotates the cylinder, and it is moved horizontally by means of the flange

E gearing into the pins on the rod F. The frame J, to the rear part of which the pawl is attached, is operated independently of the block, so as to rotate the cylinder, to leave the necessary space between the words.

Claim.—1. The movable block Q, provided with two rows of raised type, U, and a projecting arm, R, the slotted and notched plate S S', the two pivoted frames G J, the springs H K, the pawls M P, and the ratchet-wheel O, in combination with each other and the shaft C that carries the roller B, substantially as herein shown and described.

2. The toothed shaft F and the spiral thread E, in combination with the roller B, to move said roller longitudinally while being rotated by the shaft C, substantially as herein shown and described.

144,451.—Sash-Fastener.—ORVELLAS H. GILBERT, Darien, Wis. Application filed October 11, 1873.

A single sliding bolt is furnished with a recess upon each side. In the upper recess a pawl works, which is held by a spring and operated by a key. In the lower recess a bell-crank lever works, and has one end projected from the case, to be operated by the finger to retract the bolt when unlocked by the key.

Claim.—A lock for sashes and other purposes, having recesses F K in the bolt, finger-piece G, pawl L, and springs E and O, arranged to operate substantially as and for the purposes described.

144,452.—Grain-Drill.—SAMUEL HART, Fulton, N. Y. Application filed June 21, 1873.

The seed-box has a supplemental chamber, which is occupied by the feed-roller. The seed is discharged into a spout, the lower end of which is automatically closed by a valve, which may be used in planting in hills, but when thrown out of gear allows the seed to fall in drills.

Claim.—The combination of hopper A, provided with rotary feed-tube F, subjacent receptacles I, having trough closed by an automatically-opening valve, *b*, and the hollow-opening plow X, arranged substantially as and for the purpose described.

144,453.—Wheel-Plow.—FRED HASEBROOK, Stokes' Mound, Mo. Application filed September 6, 1873.

There are two bearing-wheels, and the plow-beam is supported between them and beneath the axle-tree by means of adjustable rods and side chains.

Claim.—The combination of rocking bar I and rod K with bifurcated tongue A B and beam L, as and for the purpose specified.

144,454.—Box-Opener.—MATHIAS J. HINDEN, Detroit, Mich., assignor to himself and ADOLPH FREUND, same place. Application filed February 18, 1783.

Claim.—As a new article of manufacture, the described implement, having the handle A, claw B, hammer-heads C D, and blade E, as herein specified.

144,455.—Grain-Cleaner.—WILLIAM HOUGHTON, Great Grimsby, England. Application filed January 23, 1873.

Passages, exhaust-boxes, spouts, and a fan are arranged in combination with another spout having a valve which closes the passage to the scourer and opens a spout. The exhaust-boxes are emptied by other valves.

Claim.—The combination, with the said passages, exhaust-boxes, spouts, and fan, so arranged, of the spout V, provided with valve Y, as and for the purpose set forth.

144,456.—Wine-Press.—EDWARD HOWLAND, Hammonton, N. J. Application filed June 3, 1873.

The fruit is placed upon the upper surface of the endless belt, and by that carried between the rolls, the elastic blankets of which prevent the seeds from being crushed. The expressed juice falls down through the textile endless belt, which thus serves as a strainer, into a trough beneath, and the refuse matter is ejected at the end of the machine.

Claim.—The construction and arrangement within the frame of the press-rolls B B', covered with the yielding blankets, and the textile endless belt C, substantially as and for the purpose set forth.

144,457.—Lifting-Finger for Harvesters.—ALFRED HUGHES, Brampton Ash, England. Application filed July 14, 1873.

The fingers are attached to the platform at its upper front edge, and provided with means of adjustment by which the points may be set at different heights.

Claim.—The combination and arrangement, substantially as before set forth, of the raking-platform, the lifting-finger, and the means of adjusting the lifting-finger to the platform, the said lifting-finger being constructed so as to raise the crop highest over the cutting apparatus, and the said means of adjustment being interposed (in the rear of the cutters) between the under side of the heel of the lifting-finger and the upper side of the said platform.

144,458.—Balanced Slide-Valve.—CHARLES H. HUTCHINSON, Concord, N. H. Application filed September 13, 1873.

A slide-valve having a cylinder on its back, into which fits a balance that is held against the steam-chest cover by levers connected to a small piston arranged in a central chamber, having apertures, through which the piston is forced outward by the steam. Angular packing-strips are arranged in the balance, breaking joints in the centers of the sides.

Claim.—1. The valve A, having a cylinder, B, and balance D, combined with piston K, connected with said part D by levers N and studs O, substantially as and for the purpose described.

2. A valve, A, having a cylinder, B, and balance D, with chamber L, having apertures R, combined with piston K, as and for the purpose set forth.

3. The combination of angle packing-pieces S with a square cylinder and piston, substantially as specified.

144,459.—Fire-Place Front.—EDWIN A. JACKSON, New York, N. Y. Application filed August 4, 1873.

Claim.—The frame A D, and the border-molding C, held thereto by bolt and nut, both constructed, and the two combined to retain a slab, B, in place, in the manner and for the purpose described.

144,460.—Fire-Place Lining.—EDWIN A. JACKSON, New York, N. Y. Application filed July 5, 1873.

The blocks are held by screws, which allow them to be removed singly, and space is left under the overlapping flange for their lateral expansion.

Claim.—The combination of blocks A and bottom C with an overlapping frame, D, wider both ways than the aggregate width of the rows of blocks, and with the washer-bolt B E applied at the junction of said blocks, as and for the purpose described.

144,461.—Base-Burning Stove.—SILAS H. LA RUE, Allentown, Pa. Application filed February 28, 1873.

Air enters the passage F' through the openings *f*, and escapes from said passage, through openings *h*, into the annular passage *g*.

Claim.—The combination of the annular passage *g* between the short imperforated magazine D' and the cylinder D *d*, apertures *h*, horizontal feed-chamber F', register *f*, fire-pot B, and circulation-chamber *g'* around the cylinder D and over the feed-chamber F', as and for the purpose herein described.

144,462.—Plow.—JOHN L. LAUGHLIN, Peru, Ill. Application filed August 11, 1873.

A block with two diverging arms is bolted between the beam and mold-board, forming a firm seat for the latter. The land-side handle is bolted to the longer arm.

Claim.—The angular tie-block D, constructed as described, to unite the mold-board to the beam and hold the land-side handle, in combination with the mold-board A and iron beam C, as described.

144,463.—Slide-Valve for Steam-Engines.—WILLIAM LOVE, Buffalo, N. Y. Application filed July 30, 1873.

A hollow piston-valve provided with steam-passages, so that the steam passes from the interior or cavity of the valve through said passages to the circular ports, whereby a greater bearing-surface is obtained without increasing the stroke of the valve.

Claim.—The piston-valve G, provided with the hollow extension h and steam-passages *i*, in combination with the circular ports *d*, substantially as hereinbefore set forth.

144,464.—Carpet-Stretcher.—JACOB LUTHER, Buchanan, Mich., assignor of one-half his right to RICHARDS & FOX, same place. Application filed July 25, 1873.

The cylindrical roller is provided with studs to engage with the carpet, and has its axis extended at each end, to which is attached a pair of hooked dogs adapted to be driven in the floor. One of the dogs has a pawl pivoted to it to engage with a ratchet on the end of the roller. The roller is rotated by means of a lever inserted in sockets near its middle.

Claim.—The carpet-stretcher described, consisting of the studded roller A, having handle B and ratchet *e*, in combination with dog C and pawl *d*, as described.

144,465.—Fertilizer-Distributer.—JAMES LYTCH, Laurinburg, N. C. Application filed August 9, 1873.

The frame consists of two diverging beams, and the seed-box is mounted between them. A seed-shoe with spout is hinged to the bottom of the seed-box, and caused to vibrate automatically by lugs upon a ground-wheel, which also serves as a coverer. The spring and shoe are thrown away from contact with the lugs by a crank-shaft and a hand-lever pivoted to one of the handles. A common share opens the furrow.

Claim.—1. The shoe F, provided with a spout, H, pivoted suspension-bars G, and adjustable suspension-cord I, the grooved wheel K, provided with its cross-rods N, and the spring O, in combination with the hopper E, beam A, and plow B C D, substantially as herein shown and described.

2. The combination, with the handle M, beam A, spring O, and shoe F, of the lever R, and double crank or crank-lever Q for holding said spring and shoe away from the wheel K N, substantially as herein shown and described.

144,466.—Ash-Sifter.—LEVI MARSH, South Adams, Mass. Application filed July 19, 1873.

One end of the tilting sieve rests on a bar attached to the sides of the case, and is held in a horizontal position by a pin. The rod that oscillates the sieve works through an elongated slot in the side of the case, and has connected to it a sliding plate that covers the aperture and prevents the escape of dust.

Claim.—The combination of the rod K, sliding plate L, pin M, and bar J with the sieve G and box A, substantially as herein shown and described.

144,467.—Traction-Engine.—NATHAN M. MENDENHALL, Dublin, Ind. Application filed September 25, 1872.

Claim.—1. The combination of the intermediate shaft W, bevel-wheels *j k m*, sleeve *i*, clutches A and *i*, the channel-pulleys *s s*, driving-wheels A' A', pulley C' on the intermediate shaft W, pulley D' on the sleeve, and the chain-belts V V, substantially as set forth.

2. In combination with the elements embraced in the foregoing clause, clutches A and *i*, whereby one or both the driving-wheels may be stopped without stopping the engine.

3. The intermediate shaft W, carrying the sleeve *i*, having the bevel-wheel *k*, channel-pulley *p*, clutch *i*, and channel-pulley D', in combination with the channel-pulley *r* on the crank-shaft X, and the pulley *s* on the driving-shaft L, substantially as set forth.

4. The combination of the foot-lever *a*, spring *b*, and rocking-lever *d* with the clutch *i* and channel-pulley D', whereby the driving-wheel A' may be stopped and started at will, substantially as set forth.

5. The combination of the grooved pulleys L' and F, chain-belt G, circular plate K, lever H, stud I, spring R, and caster-wheel E, whereby said caster-wheel may be guided or held stationary at will, substantially as set forth.

144,468.—Extension-Divider.—GEORGE C. MILLER, Detroit, Mich., assignor to JAMES C. MALOY, Oil City, Pa. Application filed June 3, 1873.

A tubular divider-leg has several slits upward from the end, and one of the legs thus formed has a flange turned outward. A slitted sleeve, having an inclined lower edge, is placed upon the slitted portion of the tubular leg, and when this edge is rotated against the flange the sleeve is pushed upward upon a taper enlargement, thus compressing the leg upon an adjustable point.

Claim.—The combination, with the slotted tubular leg A, provided with the flange *b* and cone *c*, of the cam-ring C, substantially as and for the purpose set forth.

144,469.—Portable Stove.—RICE MOORE, Nashville, Tenn. Application filed June 28, 1873.

The damper P only partially closes the opening in which it is placed. This construction is designed to cause a portion of the products of combustion to pass to the rear of the stove, while the remaining portion passes directly upward to the exit-flue.

Claim.—1. The combination of the damper P and plate O in the chamber F with the culinary vessel L, as shown and described.

2. The vessel L supported by the top R of the stove in the ordinary manner, but extended through the chamber F down into the oven E, so as to form part of the top and utilize the heat thereof, as shown and described.

144,470.—Fire-Escape for Safes.—CHARLES MORGAN, Philadelphia, Pa., assignor to himself and FRANK MANNING, same place. Application filed April 26, 1873.

The safe is arranged between guide-posts which lead to a well or hole in the ground below, and is supported by spring-pawls attached to its side, which pawls engage in ratchet-bars attached to the guide-posts. Spring-hammers, also attached to the safe, are held out of contact with the pawls by means of lever-catches, which catches are kept in position by a yoke attached to a rope. Should any part of the rope be destroyed by fire the spring hammers will be released and caused to strike the spring-pawls, disengage them from the ratchet-bars, and thus release the safe, which will fall into the well and escape from the fire.

Claim.—The combination of the ratchet-bars C, the pawls D, springs E, spring-hammers F, pivoted lever-catches G, buttons or other fastenings H, yoke I, and cord J with each other, and with a safe suspended substantially as herein shown and described.

144,471.—Curling-Iron.—JOSEPH S. MORGAN, Brooklyn, N. Y. Application filed October 18, 1873.

Claim.—1. The curling-iron consisting of a tube, A, with conical base part A' and double-elbow handle B, arranged and applied substantially as and for the purposes described.

2. The base part A', provided with side recesses *a* and vertically-extending apertures *a'*, for supplying air and preventing the extinguishment of the flame at the base, substantially as and for the purpose described.

144,472.—Combined Carpet-Rag Looper and Button-Hole Cutter.—GEORGE W. MORRIS and WILLIAM LENHART, Corry, Pa. Application filed October 18, 1873.

The blade is pointed and double-edged at the top, and one of the straight sides is formed of a pivoted piece made adjustable laterally upon a bar projecting from the base of the blade, by which means the button-hole slit can be made short or long as required. The eye of the blade, used as a carpet-rag looper, is cut on one side from the main part of the blade, and on the other from the pivoted adjustable piece.

Claim.—A combined looper and button-hole cutter consisting of the blade or knife A, adjustable bar D, arm F, and eye J, arranged substantially as shown and described.

144,473.—Vehicle.—MARTIN V. NICHOLS, Osage, Iowa. Application filed May 31, 1873.

Claim.—1. The wheels A A on journals within frames B B, bearing against superposed springs D D, all combined as and for the purpose described.

2. The wheel or wheels E, frame F, spindle G, socket H, coiled spring I, rollers K, and semicircular guide-rod L, combined with the recessed forward end of the car-body, substantially as shown and described.

144,474.—Means for Propelling Vessels.—JOHN O'NEIL, New York, N. Y. Application filed October 4, 1873.

The crank E and pivot D are arranged to operate in connection with the slots in the upper parts of the paddles, so that by changing the position of the crank the pitch of the paddles may be varied.

Claim.—The adjustable pivot D, cranks E, lever H, shifting-bar J, and fastening devices K, combined and arranged with paddles A B, substantially as specified.

144,475.—Drill for Well-Boring.—TIMOTHY PHILLIPS and JOSEPH GOLLETZ, Leavenworth, Kans. Application filed October 11, 1873.

Claim.—The tubular and flaring drill A, perforated tube B, pipe C, and valve D, constructed and operating in connection with each other, substantially as herein shown and described.

144,476.—Car-Coupling.—SAMUEL REED, Liberty, Pa. Application filed August 23, 1873.

The sides of the draw-head are hinged to the end piece, and are held together by a hook-frame, D, in such a manner that if one car should leave the track the hook-frame will be elevated by the link so as to leave the sides free to separate. The pin-frame is raised by means of a lever, H, which at the same time withdraws a locking-catch, I. The frame is thrown down by the link striking a gate which projects from the rear of the pin-frame.

Claim.—1. The combination of draw-bar A, having hinged sides B, with hook-frame D, pin-frame G having hinged pin F, lever H, latch I, and coupling-link E, substantially as and for the purpose described.

2. The pin-frame G, having front piece *g*, with pin-bolt *f*, arms h, roller *i*, and gate *m*, for coupling on entry of link, as described.

3. The arm h of frame G, having recess *h'*, in combination with latch I, for the purpose described.

4. The curved and projecting latch I, pivoted to the top of draw-bar, in combination with lever H, to lock and unlock frame G, as described.

5. The side part B of draw-bar having lug *l* to regulate motion of lever H, as specified.

144,477.—Plow.—ANDREWS RIVERS, Barnesville, Ga. Application filed August 30, 1873.

The standard-bars are pivoted to the beam, and a curved brace, adjustable in the beam, is pivoted to their lower ends. A screw-rod, having a hook upon its lower end for securing the share, is drawn tight by a nut and crank.

Claim.—The combination of the beam A, pivoted standard-bars B, curved brace D, adjustable rod E with crank F, and share C, arranged substantially as and for the purpose described.

144,478.—Cigarette-Machine.—JOSEPH DE S. RUISECO, Paris, France. Application filed July 19, 1873.

The papers for the tubes are transferred singly from a box by a hand (to which they are held by a suction-pump) to a grooved rod turning within a tube, which grooved rod forms the paper tube. The roll of tobacco is formed in a compressor which receives the staple from the distributing-wheel; the compressor then turns on its side over one of the molds that hold the paper tubes, when a plunger descends, forcing the roll into the tube, and discharging the previously-made cigarette.

Claim.—1. The combination of the box *u*, piston *y*, fingers 11, the transferring-hand *z*, and the air-pump, as and for the purpose described.

2. The combination of tube 15, rod 17, ring 20, trunnions 23, rods 19 and 29, pinion 33, and springs 31, all constituting the pinching and rolling device, operating as and for the purpose set forth.

3. The combination of the distributer with the compressor, when the parts of the latter operate as and for the purpose described.

4. The arrangement of the part 56 60 and sliding former 61, constituting the roll-compressor, rocking as described, in combination with the incline 63, as specified.

5. The combination of the levers 75, rollers 74, pinchers 77, collar 72, and rod 73, operating as described, for the purpose set forth.

6. The device for folding the lower end of the cigarette, consisting of the sliding pieces 35 and spur 36, with mechanism for operating the same, as and for the purpose set forth.

7. The combination of the rotating case S, provided with molds *t*, the compressor 56, the tube-forming device, and the folding and creasing devices, as described.

8. A pivoted and perforated compressor, rocked by any suitable means, in combination with the plunger 73 and a mold, *t*, as and for the purpose described.

144,479.—Car-Coupling.—HAMLIN G. RUSSELL, Lincoln, Ill. Application filed June 14, 1873.

Each draw-head is provided with a bar which hooks outwardly and automatically. Uncoupling is effected by suitable levers, and from the side of the car.

Claim.—1. The car-coupling, consisting of draw-bar A, spring-hook C, catch-plate *f*, lever B, and sliding bars *i i'*, all combined and constructed substantially as and for the purpose described.

2. The draw-bar provided with the projections *b* to co-operate with the coupling-hooks C, as and for the purpose specified.

3. The combination of the slotted angle-bars *i i'*, having fulcrum-lug *m*, the stud or pin *h*, and lever or bar B, as shown and described.

4. In a car-coupling, the lever B, having lugs e and bent ends, in combination with the hooks n, as shown and described, for the purpose specified.

144,480.—Cutting Attachment for Sewing-Machines.—WILLIAM H. SAMPLE, Albany, N. Y. Application filed August 4, 1873.

Designed to cut cloth, &c., parallel with line of stitching. One blade projects from the lower end of an arm secured to the face-plate, and it rests on the bed-plate under the cloth; and the other blade, pivoted to the same stationary arm, is operated by the needle-arm, through a slotted connecting-arm provided with an adjustable nut.

Claim.—1. The blade g', constructed as shown, in combination with blade g, as specified.

2. In combination with the cutters, the slotted arm E having the curved or hooked end b, and the adjustable arm d provided with a clamp-nut, d', whereby the device is adapted to be applied to the arm B of a sewing-machine, as described.

3. The cutting attachment C, consisting of stationary arm D with angular blade, loose arm E, pivoted cutter-blade g', and spring f, substantially as set forth.

144,481.—Soap-Cutting Machine.—JOSEPH SAIBERT, New York, N. Y. Application filed October 4, 1873.

The cutting-wires are stretched between the uprights, and, applied to the intersections of the lazy-tongs, are caused to approach or recede from each other, according to the size of the bar required. The presser carries bars at the intersection of the adjustable frame or lazy-tongs.

Claim.—1. The block-feeding device, formed of the horizontal strips D and lazy-tong frames E, the latter having a suitable adjusting apparatus, all applied or attached to a plate or frame, e, which is adjusted relatively to the block-cutting frame by suitable apparatus, as shown and described.

2. The block-cutting apparatus formed of wires m and lazy-tongs E' E', the former being stretched between the latter, which are adjusted by suitable means, all applied to a frame, b, as shown and described, to operate as specified.

144,482.—Wood-Sawing Machine.—JOHN SKINNER, Stockwell, Ind. Application filed September 13, 1873.

The arrangement of the different parts of the machine enables the operator to raise and lower the saw without leaving his post at the crank which gives motion to the machine.

Claim.—1. The saw-frame suspended by swinging bars C and F from the rock-shaft D and the rock-arm G, the latter being connected to the adjusting-lever I, and said lever being arranged relatively to the crank-shafts, substantially as specified.

2. The rocking saw-bench M N, connected to the lever R at the crank-shafts by the arm P and rod Q, substantially as specified.

144,483.—Horseshoe.—URIAH SNYDER, Conshohocken, Pa. Application filed February 21, 1873.

The calks are secured to the shoe by means of the split wedges and end projections.

Claim.—The combination, substantially as described, of the heel-calk B, the end F of the shoe with its projection d, and the split key or wedge A.

144,484.—Mechanism for Stopping and Starting Street-Cars.—JAMES M. STARR, Richmond, Ind. Application filed October 17, 1873.

Pinions actuated by the car-wheels are thrown in gear by wedge-bars operated from the platform of the car. Spiral springs attached to the shafts upon which the pinions are mounted are wound up, destroying the momentum of the car by their resistance, and, by their elasticity when released, aiding its forward motion.

Claim.—1. The pinions H H', provided with the convexo-convex teeth Z, in combination with the wheels B B, having gears Y Y, provided with teeth of the form shown and described, and the springs D, substantially as and for the purpose specified.

2. The drum O, having the recess U, constructed as and for the purpose set forth.

3. The mortised block S S, having the apertures T T, in combination with the shifting-wedges F F', and rods I I, as and for the purpose specified.

4. The shifting-bars E E', in combination with the shifting-wedges F F', rods I I, and pinions H H', substantially as and for the purpose set forth.

5. The combination of the bars E E, wedges F F', rods I I, drum-shafts C C, pinions H H, drums O O, and springs D D, substantially as and for the purpose specified.

6. The combination of the shaft C, pinions H H, and wheels B B', as and for the purpose described.

7. The combination of the block S' with the mortised block S S and the wedges F F', substantially as described.

144,485.—Hand Corn-Planter.—JACOB O. TALMAGE, Cardington, Ohio. Application filed October 8, 1873.

A glass plate is placed above the seed-slide, outside the seed-box, so that the operator can see whether the seed is carried out to the dropper. A perforated air-hole is set in the side of the seed-box.

Claim.—In a hand corn-planter, the seed-slide C, having its regulating-plate i and stop p, the scraper m, the glass plate F, division H, and ventilator L, in combination with the handle-boards A A' and seed-box B, all arranged and operated substantially as and for the purpose set forth.

144,486.—Hominy-Mill.—JACOB L. TONER, Edinburg, Ind. Application filed June 26, 1873.

One of the supporting-staves under cylinder arranged to be dropped down for cleaning the mill.

Claim.—The bottom-slotted reticulated cylinder G, combined, as described, with the stave P, and spring-held lever-frame L M O, as and for the purpose set forth.

144,487.—Subsoil-Plow.—JOHN R. TURNER and JACOB JACOBS, Fredericktown, Mo. Application filed September 13, 1873.

The base-bar is recessed upon the under side to receive the shovel, so that both combined present a smooth under surface.

Claim.—The notched bar G and shovel H, constructed and combined with each other, and with the cutter E of a subsoil-plow, substantially in the manner herein shown and described.

144,488.—Machine for Removing Snow and Ice from Roadways of Streets.—CHARLES G. WATERBURY, New York, N. Y. Application filed September 20, 1873.

A hydrocarbon oil is conducted into a closed chamber, where it is in part volatilized and in part suffered to drip through upon the roadway. The flame from the burning vapor is, by a current of air, caused to impinge upon the surface of the snow and ignite that portion of the oil sprinkled thereon.

Claim.—1. In a machine for removing snow and ice from the roadways of streets, the combination of a sprinkling apparatus and a burner, so that the roadway may be sprinkled with a liquid hydrocarbon, to be burned by the flames of the burner impinging upon the sprinkled surface, substantially as set forth.

2. A vaporizing hydrocarbon-burner combined in a machine for melting snow and ice from roadways, so that the unvaporized portion of the oil may drip through the bottom of the vaporizing-chamber and escape from it, substantially as set forth.

3. The method of removing snow and ice from the roadways of streets by a hydrocarbon sprinkler and burner, substantially as set forth.

4. The combination of the vaporizing-chamber A, air-distributing chamber K, nozzles P, perforated pipes Q, and the bottom-plate I, substantially as set forth.

5. The combination of the oil-distributing pipe C, heating and distributing plate D, and the perforated bottom plate H, substantially as set forth.

6. The combination of the igniting-pan R with the perforated bottom plate H, substantially as set forth.

144,489.—Land-Roller.—WILLIAM WILLIAMS, New Berlin, Ill. Application filed September 2, 1873.

The transverse bars of the frame are made broad and flexible, to enable the rollers to adapt themselves to uneven ground.

Claim.—The flexible bars C C, arranged to operate with the bars A A and B, and with the rollers D D and blocks d' d', substantially as and for the purpose specified.

144,490.—Car-Coupling.—MILTON R. WOOD, Chicago, Ill. Application filed March 13, 1873.

The pin is raised out of the link by a pivoted cam-lever, and by the same means is held in that position when it is desired that cars shall stand together without being coupled. As the pin is beveled on its front lower edge, coupling is automatic.

Claim.—The beveled coupling-pin D, and cam-lever D' pivoted thereto, in combination with the draw-head B, substantially as specified, and for the purposes set forth.

144,491.—Stilt.—NAPOLEON U. AINÉS, New York, N. Y. Application filed September 12, 1873.

Across a slot running lengthwise of the inside of the stilt-staff rods are placed to form a rack, with which rods a dog pivoted in the stirrup engages. The handle of the dog is weighted to render it (in an upright position) self-engaging.

Claim.—The combination of the rack, composed of pins passing through a slot or recess in the standard or pole of the stilt, and the lever-like dog hung within a slot in the stirrup to engage with the rack, substantially as and for the purpose herein set forth.

144,492.—Wagon-Seat.—THOMAS J. ALEXANDER, Westerville, Ohio. Application filed March 15, 1873.

The seat-bottom is divided into sections, each of which is rigidly secured to knees which are pivoted at their outer ends to lugs secured to the supporting-frame.

Claim.—In a wagon-seat, the knees J J, in combination with the boards A, B, C, and D, and the cleats E E, as and for the purpose set forth.

144,493.—Automatic Fire-Extinguisher.—EDWARD H. ASHCROFT, Boston, Mass. Application filed October 30, 1873.

A piston, working in a cylinder, is connected by suitable mechanism to a stop-cock within a water-pipe, so that the expansion of air above the piston, due to heat, will drive the piston down, and, by opening the stop-cock, allow the water to escape through perforations in the pipe.

Claim.—1. The combination of the cylinder A, closed pipe F, piston B, and shaft C, for automatically operating a valve, D, substantially as described and set forth.

2. The cylinder A, provided with the perforations e e, in combination with the pipe F and piston B.

3. The combination of cylinder A, pipe F, piston B, pump G, and gage H, substantially as described.

144,494.—Car-Coupling.—ARSON A. ATWATER, Smith Valley, N. Y. Application filed August 10, 1872.

The plunger is thrust forward by the weighted lever, so that it will support the pin for automatic coupling.

Claim.—The car-coupling consisting of the draw-head A, having the bent weighted arm K, pivoted to the guide-lugs B at the top of the draw-head, and the slide E, slotted vertically for the passage of the weighted arm, and recessed across its top to permit free play by the pivot-pin, constructed and combined as specified.

144,495.—Car-Wheel.—JAMES E. ATWOOD, Pittsburg, Pa. Application filed June 12, 1873.

A wrought-iron band, which is wider than the thickness of the wheel, is interposed between the tire and body of the wheel and riveted to the sides.

Claim.—A car-wheel composed of two sections, A and B, the sections united by means of an interposed iron band, C, the projecting edges being riveted down, substantially as shown and described.

144,496.—Brush.—CHARLES L. W. BAKER, Camden, N. J., assignor to JOHN L. MASON, same place. Application filed September 16, 1873.

A conical-shaped ferrule; the bristles tied and forced in at the larger part, sufficient to admit a handle, which is fastened by tacks.

Claim.—A chambered conical-shaped ferrule, a b, in combination with the handle and brush, substantially as shown and set forth.

144,497.—Thill-Coupling.—JAMES C. BARRETT, New Canaan, Conn., assignor of one-half his right to ALPHEUS E. COWL, Patterson, N. Y. Application filed October 27, 1873.

Claim.—1. The combination of the hook A' and the loop of the thill-iron, with the latch C C', which becomes itself automatically locked, substantially as and for the purpose specified.

2. The combination of the latch C C' provided with a cam, C', the hook A', and the cross-bar B' of the loop of the thill-iron, substantially as specified.

3. The combination of the hook A', the loop of the thill-iron, latch C C', and the adjustable follower D, substantially as and for the purpose specified.

144,498.—Automatic Water-Meter.—FRANCISCO DE PAULE BELLIDO, New York, N. Y. Application filed September 20, 1873.

The inlet-faucet is operated by a lever and float. A float in the lower chamber is connected by a rod to a lever, by which the rod carrying the plug of the pipe leading to the lower chamber is operated. The discharge-faucet of the meter is connected to the faucet in the pipe admitting the water to the measuring-buckets. A device for holding rubber to deaden the noise is placed on the partition between the buckets.

Claim.—1. The float F, and arm E, in combination with the upper chamber B, and inlet-faucet D of the meter, for shutting off the water automatically, substantially as herein shown and described.

2. The combination of the float T, rod U, lever W, rod X, and plug Z, with the lower and upper chambers A B, and with the discharge orifice or pipe H for automatically interrupting the passage of water from the chamber B to the chamber A, substantially as herein shown and described.

3. The combination of the cranks, shafts, and connecting-rods B' C' D' E' F' G' H' or equivalent connections, and the faucet I', with the drawing-off faucet, and with the orifice or pipe H that conducts the liquid from the upper to the lower chamber of the meter, substantially as herein shown and described.

4. The combination of the keepers M, key or slide N, rubber O, and set-screw P, with the central partition of the filling-bucket I, and with supports Q, substantially as herein shown and described.

144,499.—Device for Changing the Speed of Machinery.—ALFRED BETTS, Wilmington, Del., assignor to E. & A. BETTS, same place. Application filed October 23, 1873.

To the sleeve of the loose pulley is secured a gear-wheel, which meshes with an idle pinion pivoted to a notched disk, the latter being keyed to the shaft. The idle pinion also engages with the internally-geared pulley to obtain a fast or slow motion. The slotted disk is either locked with or released from the internally-geared pulley.

Claim.—The spindle B, having keyed fast thereto the notched disk C c, and loosely-fitted pulley G, and internal gear-wheel F, in combination with the pinions c D, stop H, and notched projection a', as and for the purpose specified.

144,500.—Process of Tanning Leather.—ROBERT BLAKE, Pontiac, Ill. Application filed October 18, 1873.

In combination with any bark-liquor used for tanning purposes, muriatic acid, saltpeter, and common salt are employed.

Claim.—The tanning-liquor composed of the ingredients and mixed together in about the proportions specified.

144,501.—Fire-Proof Partition.—CHARLES F. BRAND, Philadelphia, Pa. Application filed October 31, 1873.

Partition-walls of corrugated iron, to which corrugated iron laths are affixed by metallic clips.

Claim.—1. The combination of sheet-metal laths with corrugated sheets A to form partitions, the laths being confined by means of clips C or other suitable fastening, substantially as described.

2. The combination of the flanged plates E E with the corrugated sheets A, substantially as and for the purpose set forth.

144,502.—Cotton-Bale Tie.—ALBERT G. BUFORD, Water Valley, Miss., assignor of one-half his right to ANDREW J. MCCORMICO and H. L. DUNCAN, same place. Application filed September 27, 1873.

Claim.—The cotton-bale tie consisting of the side-tapered bars A A, cross-bars B B', and the removable wedge-shaped crossbar C, constructed substantially as shown and described.

144,503.—Tobacco-Hanger.—DE WITT C. BUSH and JOHN A. JOHNSON, Cromwell, Conn. Application filed July 30, 1873.

Two arms extending from a base embrace the plant, while in the center is a sharp prong in line with the screw-spike, which pierces it.

Claim.—The herein-described tobacco-hanger, consisting of the base A, the two arms B C, made angular upon the inside, and the spike F.

144,504.—Gas-Seal, &c.—ROBERT MAY CAPWELL, Alton, England. Application filed September 3, 1873.

Within a closed case, connected with an inlet-pipe at one end and an outlet-pipe at the other, there is arranged the gas-seal. This consists of a bonnet attached to one end of a rock-lever, the other end of which is weighted, and the lever is suspended on a rod passing through it transversely about its center and secured to the sides of the case. The case is partially filled with liquid. The bonnet rests over the vertical end of the inlet-pipe and extends down into the liquid, and is readily raised by the inflowing gas, but is depressed by a back pressure so as to seal the mouth of the inlet-pipe.

Claim.—1. The poised bonnet C, arranged within the case A over the inlet K, its mouth arranged to dip below the surface of the liquid within the case when in repose, and yield to the inflowing gas to allow its passage through the case, but prevent its return, substantially as shown and described.

2. In combination with an automatic valve interposed between the exhauster and gasometer, as described, a purifier created by supplying lime or other liquid in the chamber in which the seal operates, substantially as described.

144,505.—Automatic Fan.—WILLIAM B. CAMPBELL, Selma, Ala. Application filed October 7, 1873.

A spring-joint, upon being drawn partly out of its socket downward, allows the frame to be folded up toward the ceiling when not in use.

Claim.—1. The stems a of the fan-blades, in combination with the fixed rubber bushings b', substantially as and for the purpose specified.

2. The combination of the hanger-frame, sockets G, links F, and springs H, substantially as and for the purpose specified.

144,506.—Furnace for the Manufacture of Gas, and for other Purposes.—FRANCIS CARROLL, New Orleans, La. Application filed October 30, 1873.

The rod which holds the eyes on the door to the stationary eyes on the door-frame is made fast to the door and turns with it. This rod extends above the top of the furnace, and has a crank-arm and wrist-pin upon its upper end, which operates the damper through the medium of a connecting-rod. The closing of the damper, when the door is opened, prevents the inrush of cold air and consequent waste of fuel.

Claim.—The combination of the furnace-door and the flue or chimney damper connected together, substantially in the manner described, so that the opening of the furnace-door shall cause the closing of the damper, and the closing of the door shall cause the opening of the damper, for the purpose specified.

144,507.—Loom-Temple.—NATHAN CHAPMAN, Hopedale, Mass. Application filed October 29, 1873.

For the easy removal of the toothed roller the pin is fastened at the inner end either of the cap or trough, the outer end of the cap or trough being left open and the outer end of the pin unsupported.

Claim.—The pin N for the toothed roller to turn on, fastened to the inner end of the roller-case, and to the inner end of the case only, substantially as described.

144,508.—Food for Infants from Cereals.—LEWIS S. CHICHESTER, Brooklyn, N. Y. Application filed June 21, 1873.

The nitrates and phosphates of wheat, obtained by pulverizing and sifting the same, are mixed with ground barley, and the mass is then moistened, granulated, baked, and ground.

Claim.—1. The infants' food prepared from barley and wheat, in the manner specified, as a new article of manufacture.

2. The method of preparing cereals for use by baking them in a granulated state previous to grinding, substantially as set forth.

144,509.—Cotton-Scraping Plow.—JAMES M. COBB, Jackson, Tenn. Application filed July 22, 1873.

The front and rear standards are bent abruptly to the left and then downward to the foot-piece, the front standard forming with the foot-piece a seat for the scraper, and leaving the space immediately between the beam and scraper open for the free passage of weeds and clods.

Claim.—The combination of the frame, consisting of the top bar D, outwardly-bent standards E E curved downward and forward, as described, and the foot-piece G extending to the right of the standards, with the scraper C, the beam A, and the handles B B, all substantially as set forth.

144,510.—Earth-Auger.—WILLIAMS COLE, Milan, Tenn. Application filed July 22, 1873.

The auger slides freely upon the shaft, which is made square at the lower end to fit the square bore of the auger, so as to rotate it, but is cylindrical above. The auger rests upon a shoulder at the point, and is confined by a latch above, operated by a cord, which latter also serves as a means by which to draw the auger up. The necessity for withdrawing the auger-shaft for the discharge of earth is thus obviated, and a saving of time and labor proportionate to the depth of the boring is effected.

Claim.—A well-auger, A, provided with a central bore, in combination with the shafting B having point C, with shoulder *a* and the projection *b*, and a latch, D, all substantially as and for the purposes herein set forth.

144,511.—Nut-Lock.—EDWARD A. COOPER, Lancaster, N. Y. Application filed July 30, 1873.

A plate or washer is placed on the bolt, adjacent to the fish-plate, provided with radial corrugations. A spring-plate, having one or more pawls, is interposed between the nut and corrugated washer, the pawls having a convex bearing-surface, to allow them to ride over the corrugations in either direction. The spring-plate is also provided with wings that embrace the sides of the nut.

Claim.—The combination, with the bolt and nut, of the plate E, provided with radial corrugations e^1, and the spring-plate F, provided with pawl *f*, constructed to ride over the corrugations e^1 in either direction, as herein shown and described.

144,512.—Paper-File.—MAHLON CRAFT, Bellaire, Ohio. Application filed October 6, 1873.

The binding-wires are held in the longitudinal groove of a bar by being inserted in a slot at one end of the bar, and attached to an adjustable screw at the other end.

Claim.—1. A newspaper-holder consisting of the holding-case A, retaining wire or wires C, slide *a*, its holding-pin *f*, adjusting-screw *e*, and the notched end *b* for the bent ends *c* of the wires, as and for the purpose described.

2. The pivoted equalizer *g* for the wires C, in combination with the slide *a* and the adjusting-screw *e*, as described.

144,513.—Paper-Box Fastening.—DELAVAN CRANNELL, Amsterdam, N. Y. Application filed October 18, 1873.

Claim.—The paper-box fastening C, made of spring metal, and composed of a hook, *a*, notched and angular body *b*, and tongues *c*, and applied to a box, as and for the purpose described.

144,514.—Carriage-Spring.—JOHN CURTIS, Cincinnati, Ohio. Application filed September 12, 1873.

Claim.—1. A carriage-spring plate, C, attached at mid-length to the bed-frame, and resting by its ends in rubber cushions E E', with inclosing-boxes F F', connected by a tie-rod, I, substantially as set forth.

2. The spring-plate with T-formed extremities, in combination with the cushions E E', and with confining devices F F' J J' L L', substantially as set forth.

3. The combination of the lining K, cushions E E', and caps J J' with the spring C, substantially as set forth.

144,515.—Tool for Marking Edges of Soles of Boots and Shoes.—J. WESLEY DODGE, Malden, Mass., assignor to THE SHOE MACHINERY MANUFACTURING COMPANY. Application filed April 5, 1873.

Claim.—The described tool for marking the edges of soles, having the pattern-wheel A and color-wheel *i*, constructed substantially as described, and relatively arranged and operating as set forth.

144,516.—Faucet.—ARNOLD DOLL and CHARLES ELLING, Cleveland, Ohio. Application filed September 29, 1873.

A nozzle, in which are arranged the valve and cam operating the same, is made in a separate piece and attached to the faucet-barrel by any suitable means, said cam being operated by a crank and handle exterior to the nozzle.

Claim.—The cam I, valve D, plate E, provided with a recess, F, and outlet G, all constructed and arranged to operate as described, in combination with the body A of the faucet, substantially as and for the purpose set forth.

144,517.—Manufacture of Baryta.—CYPRIEN M. T. DU MOTAY, Paris, France. Application filed April 10, 1873.

The central hearth is combined with two fire-places and two regenerators, one on each side, used alternately, so as to obtain a high temperature and a reducing flame necessary to reduce the sulphates and carbonates of barium. The sulphuret thus produced is dissolved in water and boiled with an equivalent of oxide of lead. Double decomposition takes place. The resulting sulphuret of lead is treated with hydrochloric acid, and the chloride treated with lime or magnesium, reproducing the oxide of lead for further use.

Claim.—1. The combination of the chamber J, the two hearths K L, chambers Q R, valve U, and chimney V, all substantially as and for the purpose described.

2. The methods herein described of revivifying and utilizing indefinitely compounds and intermediate re-agents, to transform the sulphuret of barium into hydrated baryta or into carbonate of baryta.

144,518.—Culinary Utensil.—HENRY G. DUNKELBERGER, Shamokin, Pa. Application filed September 6, 1873.

The perforated plate is constructed to receive a perforated rim to adapt the device to different-sized vessels.

Claim.—The perforated plate or disk A, provided with the lip or shoulder described, in combination with the perforated rim C, provided with the lips and shoulders, substantially as and for the purposes shown and specified.

144,519.—Bridge.—JAMES B. EADS, St. Louis, Mo. Application filed August 27, 1873.

A compression equivalent to the maximum load of the arch is produced in the chords of each arch by means of screws passing through the skew-backs or abutments resting on plates on top of the central piers, so that when the arch is loaded the compressive strain will simply take the compression from the chords without producing a tensile strain in them. The chords are made continuous from one end of the bridge to the other by allowing the skew-backs on the central piers to slide on the plates. Provision is made for tensile strain should it occur.

Claim.—1. The described method of relieving the central piers of bridges from the unequal thrust of the arches, or equivalent members of truss-bridges, caused by moving loads, by making the roadway or longitudinal members supporting the same substantially continuous against compressive strains from the abutment at one end of the bridge to the abutment at the other end of the bridge, substantially in the manner and for the purpose set forth.

2. In combination with the cords or distance pieces A A, the compression and tensional screws K and G, substantially as and for the purpose set forth.

144,520.—Ribbon-Block.—THEODOR EHRENBERG, New York, N. Y. Application filed April 9, 1873.

The ribbon-block consists of a hollow drum, containing a smaller one inside, for supporting and strengthening the heads or ends.

Claim.—A ribbon-block composed of a hollow body, *a*, and heads *b b*, said heads being steadied and supported by an internal brace, *c*, substantially as shown and described.

144,521.—Canopied Chair.—THOMAS ELKINTON, Philadelphia, Pa. Application filed August 23, 1873.

Claim.—The combination, with a chair, of a canopy, the support of which constitutes part of the structure of the chair, all substantially as set forth.

144,522.—Saw-Filing Machine.—JOSEPH J. ENGELMAN, Chillicothe, Mo. Application filed June 10, 1873.

The file-guides are formed in sections, and capable of adjustment to different widths. The curved guide-bearer is provided with concentric rows of holes to retain the guides at a desired angle.

Claim.—1. The curved guide-bearer H, provided with the apertures K arranged in concentric rows, for adjusting the guides I I', substantially as shown and described.

2. The sectional guides I I', pivoted and provided with the thumb-screws *n* and spurs *m* for holding them in position and upon the guide-bearer H, substantially as shown and described.

3. The curved guide-bearer H, sectional guides I I', block F, and bar E, in combination with the vise D, substantially as shown and described.

144,523.—Calculating-Machine.—THEODOR ESERSKY, St. Petersburg, Russia. Application filed August 21, 1873.

An apron or belt, with columns of figures on both sides, is wound from one roller to another, so that the rollers shall display opposite sides of said apron at windows in the inclosing-case. An index-bar with digits marked thereon is arranged between the rollers.

Claim.—The combination of the two rollers A B for displaying opposite surfaces of the strip D, having rows of figures on both sides, and with the index plate or bar E, substantially as herein shown and described.

144,524.—Machine for Dressing Metal Cocks.—HENRY ESSEX, Meadville, Pa. Application filed September 13, 1873.

The tool-holding carriage works in angular slides in the bed, and carries the tools, which bore the cock and dress the outside of the plug, at the same angle.

Claim.—The angularly-movable carriage or tool-rest F, combined with cock and plug holders C D, as and for the purposes described.

144,525.—Treadle.—WILLIAM FELZER, Frank Hill, Miss. Application filed October 17, 1873.

Claim.—The foot-board C, provided with the stationary box *e*, movable box *f*, groove *c*, pins *d d'*, and pitmen *b b'*, in combination with the double crank *a a'*, and shaft B, substantially as hereinbefore set forth, and for the purpose specified.

144,526.—Apparatus for Charging and Drawing Gas-Retorts.—WILLIAM FOULIS, Glasgow, North Britain. Application filed September 13, 1873.

The outer and inner ends of the hydraulic cylinder are connected, by means of coupling-joints and flexible pipes, to a water or pressure main, and the application of the pressure to either side of the piston is controlled by a four-way cock, by which means a scoop carrying the charge, or a rake to remove the charge, is introduced or withdrawn from the retort.

Claim.—1. An apparatus for charging or drawing retorts, in which the scoop or rake is combined with and operated by the piston-rod of a water or other fluid engine, as set forth.

2. The combination, in a retort charging or drawing apparatus, of a series of concentric cylinders and pistons, sliding one within the other telescopically, and operated by water or other fluid, as specified.

3. The combination, with the cylinder or cylinders, of a casing, H, and vanes U V, or equivalent devices, by which water or other fluid may be made the means of rotating the cylinder.

4. The combination, with a drawing or charging apparatus, of water-engines, connected to and operating the propelling and elevating mechanism, as set forth.

144,527.—Steam-Heater.—WILLARD M. FULLER, New York, N. Y. Application filed May 3, 1873.

Claim.—1. The pipe D, located at or near the top of the generator B, allowing steam to be generated in an apparatus having free circulation without forcing the water into such pipe, substantially as set forth.

2. The trap E, in combination with the pipes C D and boiler B, substantially as and for the purposes specified.

144,528.—Fastener for Meeting-Rails of Sashes.—LORENZO D. GILLETTE, Meriden, Conn. Application filed September 5, 1873.

A lever moving at right angles to the plane of the window is furnished with hooks which take into recesses in an upright plate upon the opposite rail. A friction-spring holds it closed, and also open.

Claim.—The lever D, the axis of movement of which is parallel to the bar upon which it is placed, and provided with one or more hooks, *d*, combined with a spring, *a*, to hold the lever, and with a keeper, with which the said hooks may be engaged to secure the sash, or turned therefrom to relieve the sash, substantially as described.

144,529.—Machine for Cutting Coal.—JOHN GILLOTT and PETER COPLEY, Barnsley, England. Application filed September 15, 1873.

The bracket to which the cutter-wheel is pivoted is provided with a flange which engages with a corresponding flange formed upon the inner periphery of the cutter, the object being to render the cutting devices stronger and more durable.

Claim.—The cutter-wheel A and its flange S, in combination with the bracket C and its flange T, for the purpose specified.

144,530.—Caster for Furniture.—GEORGE H. GLAD, Boston Highlands, Mass. Application filed September 22, 1873.

The spindle of the caster is swiveled to a nut which receives a screw-shank. This screw-shank carries a bevel-pinion which is operated upon by another pinion upon a shaft which enters the caster-case at right angles to the shank. A key rotates the shaft, and hence elevates or depresses the caster through the intermediate screw-shank and nut.

Claim.—The spindle B and nut C, connected together, as shown, within the casing F, and combined with the screw D, shaft G, and pinions E and H, in the manner and for the purpose substantially as specified.

144,531.—Wash-Boiler Attachment.—WILLIAM W. GLANVILLE, Crawford county, Iowa. Application filed January 25, 1873.

Claim.—The perforated diaphragm C, provided with a supporting-flange, E, and with a perforated wedge-shaped projection, A, for operation in connection with a wash-boiler, substantially as described, for the purpose set forth.

144,532.—Road-Trimmer.—BARNARD GOODRICH, Stratham, N. Y. Application filed August 1, 1873.

The cutters or scrapers are adjusted in pitch by a latch-bar which rises from the front end of the drag-bar through a slot in a supporting-bridge upon the forked main tongue, and is attached adjustably to a bar extending rearwardly and pivoted to an upright hinged lever operating upon the cutter-head.

Claim.—1. The combination of the bridge G, the latch F, the post K', the springs L L, and the arms H I, arranged and applied to adjust the pitch of the cutters, as explained.

2. The combination of the adjusting mechanism, as described, with the draft-tongue D, the cutter-head A, its tongue B, and cutters K C C, substantially as set forth.

144,533.—Lawn-Seat.—HOWARD H. GRATZ, Lexington, Ky. Application filed June 4, 1873.

The back is solid and made wider than the seat, and connected thereto by J-shaped hinges and jointed braces.

Claim.—The combination of the seat A, solid back B, made wider than the seat, and connected thereto by the J-shaped hinges *c*, and the jointed braces *d d*, all as and for the purposes herein set forth.

144,534.—Fence.—JOSEPH GRAY, Raymond, Miss. Application filed March 1, 1873.

Posts for supporting rails are formed of two uprights, two inclined braces surmounted by cap pieces, and two sill pieces which embrace both uprights and inclined braces, and three of the posts, or two panels, are connected by single cap and single base rails.

Claim.—The three fence-posts composed each of the pairs of uprights A A, the pairs of inclined braces C C connected at the top by a cap piece, E, at the bottom between the two bars D D, and all connected together by a single top rail, H, and a single base rail, I, substantially as and for the purposes herein set forth.

144,535.—District and Fire-Alarm Telegraph.—JOHN H. GUEST, Brooklyn, N. Y. Application filed October 29, 1873.

Series of thermostatic fire-alarms placed in a normally-closed circuit of a district or fire telegraph, as per patent of October 14, 1873. In addition in the house, in a branch circuit, alarms and indicators are placed, to which the current is transferred after the alarm to central station is turned in, giving an alarm in the house itself or at other desired point, and without breaking the main circuit.

Claim.—1. The combination, in a normally-closed circuit, of one or more district alarm-signal boxes, one or more automatic fire-alarms, indicators for each fire-alarm, and an alarm mechanism, arranged to turn in an alarm to a central station, and to sound an alarm in the house where the automatic fire-alarms are placed, or at other convenient point, and to show by an indicator the point whence the alarm originates, all through the operation of one main circuit, substantially as set forth.

2. The combination, with a normally-closed circuit, of a district alarm-signal box and a house-alarm, substantially as set forth.

3. The combination, with a normally-closed circuit, of a district alarm-signal box, and a local indicator, substantially as set forth.

4. The combination, with a normally-closed circuit, of a district alarm-signal box, a house-alarm, and a local indicator, substantially as set forth.

5. The combination, with a normally-closed telegraphic circuit, of an automatic fire-detector, a house-alarm, and an indicator, arranged to be operated without any break in the continuity of the circuit.

6. The combination, with a fire-alarm box or other automatically-acting signaling device, of devices for closing one circuit at or just before the time another circuit is broken, for preserving the continuity of a circuit, substantially as set forth.

7. The variable thermostat, Figs. 3 and 4, in combination with an electro-magnetic fire-alarm.

144,536.—Machinery for Cutting Dovetails.—WILLIAM T. HAMILTON, Rathmines, Dublin, Ireland. Application filed March 10, 1873.

The dovetail-grooves are cut by a saw, which has a rocking motion upon its arbor.

Claim.—1. A circular saw mounted on an axle to which a reciprocating endwise motion, as well as a rotary motion, is simultaneously imparted, as herein set forth, for the purpose of cutting dovetails.

2. The combination of the parts *c*, *d*, d^1, *e*, and *f* with the crank-pin a^2 of the reciprocating and rotating axle *a*.

3. The combination of the parts *g g' h h'* and the quadrant-piece *i* with the devices for operating the saw, as and for the purposes herein set forth.

144,537.—Car-Brake.—ELIOT P. HARRINGTON, Volusia, N. Y. Application filed September 27, 1873.

Claim.—1. The combination of the releasing-rods E, vibrating lever G, and the swinging brake-bars C carrying brake-shoes *b*, substantially as and for the purpose specified.

2. The longitudinally-movable draw-bar J, in combination with the lever G, releasing-rods E, applied to brakes which are held in contact with the wheels by means of springs, substantially as described.

3. The releasing-rods E E, pivoted to a vibrating lever, G, to release the brakes from the wheels, substantially as described.

144,538.—Steering-Propeller.—WILLIAM HARDEN, Green Point, N. Y. Application filed October 7, 1873.

Claim.—1. The pendulous arms G, in combination with the revolving worm-shaft C', substantially as specified.

2. The pendulous arms G, in combination with the rudder-post B and the revolving worm-shaft C', whereby said arms not only serve to constitute a propeller, but also a flexible rudder, essentially as described.

144,539.—Rack for Dental Tools.—GEORGE E. HAYNE, Buffalo, N. Y., assignor to BUFFALO DENTAL MANUFACTURING COMPANY, same place. Application filed September 12, 1873.

A plate of spring-metal is slotted at intervals, and the arms formed between the slots are furnished with semicircular depressions, into which the various tools are inserted. This entire plate, with its spring-arms, is secured to the edge of a table or any other convenient place.

Claim.—The rack, composed of a plate or bar, constructed or provided with a series of elastic jaws formed of the same piece of metal as the plate, and recessed on their inner sides to receive and hold the tools, essentially as and for the purpose herein set forth.

144,540.—Electrical Water-Gage, Alarm, and Register.—CHARLES HEISLER, St. Louis, Mo. Application filed June 24, 1873.

A float is connected with a stem passing through a stuffing-box in the boiler, and this stem is connected with an electrical indicator and alarm for "high" and "low" water, which registers the length of time the water is allowed to remain in either condition.

Claim.—1. The float B, operating a circuit-breaking device,

substantially as herein shown, in combination with a recording device, to indicate the length of time the water has been at its high or low stage, as set forth.

2. The combination and arrangement of the float B, arm *b*, stem C, oscillating arm E, roller F, circuit-breaking plates f^1 f^2 f^3 f^4, wires J J^1 J^2 J^3 J^4, arranged in the case D, with the electro-magnets L^1 L^2 L^3 L^4, armatures l^1 l^2 l^3 l^4, index-hands M, and dial-plate *m*, arranged in case E, as and for the purpose set forth.

3. The combination and arrangement of the float B, arm *b*, stem C, oscillating arm E, roller F, circuit-breaking plates f f^5, and wire J J^5, with electro-magnets L L^5, armatures l l^5, pivoted detents b^5, stops *n* n^1, clock-work N, striker n^2, bell n^3, and index-hands O *o*, as and for the purpose set forth.

4. The oscillating arm E *e* e^1, bolt e^2, non-conductor piece e^3, spring E^1, lug E^2, roller F, collar *f*, and spring *f'*, in combination with the stem C, arm *b*, float B, and circuit-breaking plates f f^5, &c., connected to suitable indicating, alarm, and recording devices, as and for the purpose set forth.

144,541.—Automatic Grain-Weigher.—JOHN W. HILL, Dayton, Ohio, assignor of one-half his right to CHRISTIAN HERCHELRODE, same place. Application filed August 30, 1873.

From the weigh-beam of a grain-meter is suspended a tilting frame, in which are pivoted dumping-boxes, which are alternately brought under the spout, and are so connected that the dumping of the filled box throws the empty one into position to receive grain.

Claim.—1. In an automatic grain-weigher of the character stated, the sinking and oscillating hanger C, in combination with the self-dumping and self-righting scale-pans A and B, pivoted thereto, substantially as and for the purpose specified.

2. The sinking and oscillating hanger C, in combination with the self-dumping and self-righting scale-pans A and B, linked together by a connecting-rod, F, substantially as specified.

144,542.—Dried-Fruit Loosener.—HARRY W. HOLMAN, Waterloo, Iowa. Application filed August 16, 1873.

A rod has at its lower end a spear shape; just above, in a slot, are pivoted two independent wings that turn up when the rod is forced into the fruit, and turn down when drawn up, thus loosening the fruit.

Claim.—The device for loosening dried fruit, having its wings D D pivoted at their inner ends, projecting outward and downward when open, and curved upward and outward when folded, in connection with the shouldered spear-shaped point C and shaft A, substantially for the purposes mentioned.

144,543.—Apparatus for the Manufacture of Hydrogen Gas.—WILLIAM L. IMLAY, Philadelphia, Pa. Application filed October 9, 1873.

The generator and carbureter are submerged in the dilute acid used to generate the gas; and, as the arrangement of the stop-cocks is such that both cannot be closed at the same time, the waste liquor from the generator is forced into the compartment containing the carbureter whenever communication is closed between the generator and the chamber in which it is placed.

Claim.—The combination of the tank A, having central partition B, the submerged generating-tank D, with plug *a* and false perforated bottom F, the submerged carbureting-tank D', with perforated disks H H, the pipes G I J, stop-cocks *b b*, and operating-rods *d d*, with cranks and connecting-rod, all constructed and arranged substantially as and for the purposes herein set forth.

144,544.—Process of Removing Ink from Engraved Printing-Plates.—JOSEPH S. IVES, New York, N. Y. Application filed October 9, 1873.

The mass of ink smeared over the surface is removed by ordinary wiping, and the plate cleaned to the proper condition for impression by washing with water.

Claim.—The process of cleaning engraved printing-plates by first removing the bulk of the ink from the plain portions of the surface, and then washing off such portions with water, substantially as hereinabefore set forth.

144,545.—Valve for Direct-Acting Engines.—HENRY A. JAMESON, Brooklyn, N. Y., assignor to himself and GEORGE WHITTAKER, same place.—Case B. Application filed August 4, 1873.

A pin projects downward from the valve into a diagonal slot in an oscillating shaft. The valve has two recessed arms, which, by reason of the diagonal motion imparted by the shaft, open steam and exhaust ports to opposite ends of the piston, which operates the valve longitudinally.

Claim.—1. The combination of the steam-valve C having the projecting curve *g h*, passages *i*, and recess *j*, with the steam-chest D and recessed piston E, the steam-chest being wider than the valve to allow a diagonal motion to the same, as set forth.

2. The combination of the steam-valve C, constructed as set forth, and provided with a projecting pin, *f*, with the oscillating shaft D, having the oblique slot or groove *e*, as and for the purpose described.

144,546.—Car-Starter.—WILLIAM A. JORDAN, New Orleans, La., assignor of one-half his right to ANDREW J. AIKEN, same place. Application filed September 11, 1873.

Claim.—The combination of the sliding bar B, provided with the pawl C having the extension *c*, and held to ratchet D by the spring *d*, the crank-shaft E, chain F, rods G I, lever H, and rods J J', substantially as shown and described.

144,547.—Watchmaker's Lathe.—EDWARD H. KELLY, Jackson, Tenn. Application filed April 3, 1873.

An adjustable tubular center for centering the work and guiding and supporting the drill.

Claim.—In a watchmaker's lathe, a tubular center, D, for holding and guiding the drill in boring the ends of pivots or pins, as herein set forth.

144,548.—Paper Product.—JOHN L. KENDALL, Foxborough, Mass. Application filed April 16, 1873.

Claim.—As a new article of manufacture, paper pulp and sponge combined with linseed-oil, for the purpose specified.

144,549.—Reed-Organ.—WILLIAM J. KENT, Buffalo, N. Y., assignor of one-half his right to GEORGE A. PRINCE, same place. Application filed May 31, 1873.

The front set of reeds, besides the usual mute-valve at the mouth of the reed-cells, has an additional stop-valve on the roof of the reed-cells, qualifying the tone of said reeds when open. The back set of reeds, being tuned with the front set while the roof-valve is closed, of course wavers, if sounded while said roof-valve is open.

Claim.—In a reed-organ, in combination with a double set of reeds *a a'*, the three reed-openings *b b' c* and three mutes *d e f*, to produce the tone or stop called vox celeste, all constructed and arranged to operate substantially as specified.

144,550.—Well-Drill.—GEORGE KOCH, Cass, Pa. Application filed March 1, 1873.

Claim.—1. The rock-drill having the faces *s* gradually fluted from the cutting-edge upward, the concavity gradually becoming more shallow, and merging into the shank portion, as described.

2. The rock-drill having fluted sides *s'*, convex sides C, and centrally-notched cutting-edge, substantially as specified.

144,551.—Velocipede.—JAMES F. MCCLURE, Connersville, Ind. Application filed August 2, 1873.

Claim.—1. The endless chain *m*, rollers *n n*, frame *p*, axle-pulley *n*, and set-screw *s*, in combination with the wheel G, pinion *e*, shaft *f*, as and for the purpose specified.

2. The combination of the wheel G with pinion *e*, shafts *f f'*, gears *e' e'*, fly-wheel K, clutch *h*, endless chain *m*, and pulley *n* on the axle A, all as and for the purposes herein set forth.

144,552.—Plow.—WELLS C. MCCOOL, Guthrie Centre, Iowa, assignor of one-half his right to DANIEL H. BRUMBAUGH. Application filed August 15, 1873.

In a double plow, each carried upon its own beam, the means of securing together at the rear by two T-shaped bars with clamp-bolts, and at the front by braces, in connection with a draft-equalizer.

Claim.—1. The T-shaped yokes B B carrying the loops *a a*, when combined with the beams and standards of two plows, in the manner and for the purposes specified.

2. The equalizer D, having a branch, *b*, carrying the plate *c*, and rod *d* formed and combined with the front ends of two plow-beams, in the manner and for the purpose specified.

144,553.—Lather-Brush Handle.—WILLIAM H. MILES, Jr., Brooklyn, N. Y. Application filed July 3, 1873.

Claim.—As a new article of manufacture, a wooden lather-brush handle, with a socket for the bristles, formed of one piece of wood, and coated with japan varnish or enamel, as and for the purposes specified.

144,554.—Signal-Lantern.—SAM. H. MILLER, Brooklyn, N. Y., assignor to himself and JESSE E. FOLK, same place. Application filed May 6, 1873.

The removable top of a lantern, and the devices by which it is attached to the frame, are formed of a single piece of sheet metal. The standards, having grooves for holding the adjacent edges of the glass screens, are also each formed of a single piece of sheet metal.

Claim.—1. The guides or ways B, each constructed of a strip of metal bent and folded to form separate longitudinal grooves *b b* for reception of the edges of adjacent glasses, substantially as shown and described, and whereby the frame of the lantern is materially stiffened.

2. The cap, top, or detachable piece D, struck up or bent to form a flange, *m*, of double thickness of metal, and projecting rim or border *n*, having lips A cut and bent from the latter, in combination with the openings *i* in the recessed internally-projecting flange *k* of the ring or portion which the piece D is arranged to fit in and lock with, substantially as shown and described.

144,555.—Limekiln.—LUCIUS MONTGOMERY, Akron, assignor of one-half his right to LEROY NEWMAN, Newstead, N. Y. Application filed March 14, 1873.

Claim.—1. The door C and casing *b c d* set slanting in the opening *a* of the hopper B, in combination with the kiln A A', as and for the purpose specified.

2. The door C and casing *b c d*, constructed as described, in combination with the iron supporting-plate E A and kiln A, all arranged in the manner and for the purpose hereinbefore specified.

3. The iron plate E, having the beveled flange *h*, in combination with the kiln A, as and for the purpose specified.

144,556.—Heel-Stiffener for Boots and Shoes.—STEPHEN MOORE, Sudbury, Mass., assignor to himself and HOMER ROGERS, same place. Application filed October 28, 1873.

Outer coated, or both outer coated and inner coated, with a water-proof enamel.

Claim.—A heel-stiffener formed of leather-board, or similar material, coated, substantially as described.

144,557.—Paper-Pulp Engine.—STEPHEN MOORE and RUFUS H. HURLBUT, Sudbury, Mass., assignors to themselves and HOMER ROGERS, same place. Application filed October 2, 1873.

As *b* revolves the pulp is made to circulate, and is mixed without impediment by passing up and along the curved pieces *d* over again upon the wheel. The curved pieces *d* are attached to the inside of the tub.

Claim.—In combination with the tub *a* and wheel *b*, the spiral blade or blades *d*, substantially as described.

144,558.—Thill for Vehicles.—ANDREW MUHLEISEN, Ottawa, Ohio. Application filed October 6, 1873.

Claim.—1. The side thill A, having the curved cross-bar B and an arm, F, in combination with the side thill C, adapted to receive shaft-irons E, substantially as shown and described, for the purpose specified.

2. The shaft-iron E, having the thill-arm *b*, extension *c*, and laterally-equalizing arm D, substantially as described, for the purpose specified.

144,559.—Rotary Engine.—EDWARD MYERS, New York, N. Y., assignor to AMBROSE W. THOMPSON, same place. Application filed February 24, 1873.

The valve prevents the escape of steam through exhaust-port until the piston passes a vertical position, when gravity assists said piston in addition to its inertia in passing over a space, during which time no steam can be admitted.

Claim.—A recessed hollow abutment operating eccentrically, and a working-shaft rotating in the central line of the steam-chamber, the latter being provided with ports *a a* arranged, as set forth, in combination with a piston directly attached to the working-shaft, and provided with a valve, *a'*, substantially as described.

144,560.—Jack-Center for Edge Trimming and Burnishing Machines.—THOMAS M. ORR and ANDREW R. SEARS, North Bridgewater, assignors of one-half their right to CHARLES A. PRATT, Clinton, Mass. Application filed July 31, 1873.

The universal joint furnishes a self-adjusting center in presenting the boot or shoe to the operative mechanism.

Claim.—In a machine for burnishing and trimming heels, the center D, in combination with the ball-and-socket joint E C and the mandrel A B, constructed substantially as described, and for the purpose set forth.

144,561.—Life-Preserving Cape.—GEORGE PALMER and CHARLES PALMER, Morris Run, Pa. Application filed June 17, 1873.

Water-proof cellular cape adapted to be inflated and secured by straps around and under the arms so as to sustain the body in an erect position, and thereby more certainly keep the head above water.

Claim.—A sailor's water-proof cape constructed and adapted, as described, to be converted by inflation into a life-preserver, in which the point of suspension is by the arms, substantially as described.

144,562.—Cotton and Corn Planter.—ASA PENNINGTON, Jr., Brenham, Tex. Application filed August 2, 1873.

A barrel-shaped hopper is revolved by a belt from one of the driving-wheels, and has a slot entirely around it in the center for the escape of seed. A frame, pivoted in front, carries an opener ahead of the hopper and two coverers in rear, the opener carrying a rod, which extends back between the sections of the hopper to stir the seed. The pivoted frame is adjusted by foot-levers, the seat being located on a support extending to the rear.

Claim.—1. The hinged or pivoted frame E, carrying the plows D and G G, and adjusted by the foot-levers *a a*, in combination with the revolving seed-hoppers J J, substantially as and for the purposes herein set forth.

2. The combination of the sulky A B C with seat H, hinged frame E, plows D and G G, foot-levers *a a*, revolving seed-hopper J J, and stirring-rod A, all constructed and arranged substantially as and for the purposes herein set forth.

144,563.—Rattan-Ware.—SULLIVAN H. PENLEY, Chelsea, Mass. Application filed August 6, 1873.

A basket or other article is made of the pith of rattan, which is united at the ends, making long belts or cords. It is then wound on a former and secured by glue, cement, or other fastening.

Claim.—1. A basket or other article of rattan-ware, formed of rattan pith wound in continuous strands or coils, and secured by glue, cement, or other fastening, substantially as specified.

2. A basket or other article made of rattan pith wound in continuous strands or coils, and provided with the stays C, applied substantially as and for the purpose specified.

144,564.—Wire Mattress.—DAVID J. POWERS, Chicago, Ill. Application filed April 26, 1873.

Zigzag wires are connected together at their angles by means of wire-coils.

Claim.—A wire mattress or bed-bottom, composed of zigzag wires *a*, connected together at their angles *b* by means of wire-coils *d*, substantially as specified.

144,565.—Racking-Cock.—AUGUST ROOS, New York, N. Y. Application filed June 6, 1873.

Two arms, each provided with a discharge-nozzle and stop-cock, are combined and arranged upon a tubular stem. Each of said arms may be provided with a try-cock.

Claim.—In combination with the tubular stem A, the branching tubes B C, each provided with a nozzle having its own independent stop-cock, and either or both nozzles provided with the lateral try-cock F, constructed to operate as herein shown and described.

144,566.—Hand Corn-Planter.—MILES C. ROOT, Janesville, Wis. Application filed July 15, 1873.

The operating rod or plunger is locked in position when desired by a pivoted latch.

Claim.—1. In combination with the operating-rod I, the seed-slide E, and casing A, the hinged locking-bar L, as and for the purposes described.

2. The casing A and supplemental casing F, the slide E having gage E', the bent operating-rod I, and hinged locking bar L, when combined and arranged as and for the purpose set forth.

3. The cover or door M, provided with the flanges *m*, and combined with the opening A' of the casing A, substantially as and for the purpose specified.

144,567.—Egg-Beater.—JOHN F. ROTH, Reading, Pa. Application filed October 16, 1873.

A can is hung by trunnions on vertical arms, that are pivoted to a frame. At one end of the frame is suitable gearing that drives a horizontal shaft within the can. On the shaft are wheels of beveled wings. The lid of the can is secured by packing and links.

Claim.—1. In combination with a cylindrical can, D, the central shaft G, provided with two or more wheels composed of hands I and a series of curved and beveled arms or wings, H H, all substantially as and for the purposes herein set forth.

2. The can D, hung upon trunnions *c c* on the pivoted arms E E, and provided with lid D', packing *f*, pins *f f*, and bails or loops A A, all substantially as and for the purposes herein set forth.

3. The combination of the frame A, cog-wheel B with crank C, pinion *a*, socket *d*, arms E E, can D with lid D', shaft G, and two or more wheels, H I, all constructed and arranged substantially as and for the purposes herein set forth.

144,568.—Circuit-Breaker for Electric Railway-Signals.—DAVID ROUSSEAU, New York, N. Y., assignor to himself and WILLIAM C. SMITH, same place. Application filed February 5, 1873.

Vibrating permanent magnet, elevated on a post, and in proximity to track, is attracted by metal of car or locomotive, and so caused to make or break an electrical circuit.

Claim.—1. The circuit opening or closing apparatus placed in proximity to a railway-track, to be actuated magnetically by a passing train or engine without bodily contact therewith, as specified.

2. The needle A arranged, in combination with the springs *b* and *d*, to be operated by a passing engine or train without contact, as set forth.

144,569.—Device for Rounding the Ends of Bolts.—JAMES I. SCHERMERHORN, Schenectady, N. Y. Application filed August 30, 1873.

The bolt is clamped between the jaws or dogs of the chuck, and is trimmed off by the concave cutter C, secured in the transversely-perforated cutter-head B.

Claim.—A mechanism for rounding the ends of bolts, studs, &c., composed of a suitable chuck for clamping the bolt, and a transversely-perforated cutter-head, B *b*, which supports the projecting end of the bolt in a removable and exchangeable sleeve-bearing, D, and carries a concave cutter, C, substantially as specified.

144,570.—Cigar-Point Splitter.—ADAM SICKENBERGER, Chicago, Ill. Application filed June 2, 1873.

The cigar is passed into a cup, which is supported yieldingly upon coiled springs upon two guide-standards, an opening in the bottom of the cup permitting a fixed blade to enter and pierce the cigar.

Claim.—The construction and arrangement of the blade B, guide-standards C C, ring or yoke D, springs E E, and socket F, with relation to the base A, as and for the purpose set forth.

144,571.—Manufacture of Printing-Type.—JULIUS SILVERSMITH, Chicago, Ill. Application filed March 11, 1872.

The blank or strip of metal is first compressed and properly shaped in a rolling-mill. A circular saw having an intermittent motion then saws it into proper lengths. A reciprocating matrix then forms the letter or ornament upon the end, and a trip-hammer or punch nicks the sides. All combined in one machine.

Claim.—1. In a machine for manufacturing types, &c., from blanks of ductile metals, the combination of a rolling-mill for compressing or shaping the blank, an intermittently-acting saw for cutting the blank into lengths for forming type, a reciprocating matrix or die for impressing the letter, character, &c., upon the same, and a trip-hammer or punch acting simultaneously with the latter for nicking the type, as herein shown and described.

2. The transversely-sliding frame A, rollers G H, ratchet and pawl mechanism J K, connecting-rod J, and eccentric T, constituting the mechanism for preparing and feeding the blank to the cutting, stamping, and nicking devices, as herein shown and described.

3. The intermittently-acting circular saw Z, oscillating frame *w*, arms *u v*, and eccentric *t*, combined with suitable mechanism for imparting a rotary motion to the saw, as and for the purpose described.

144,572.—Milk-Cooler.—DAVID SMITH, Jamestown, N. Y. Application filed May 14, 1873.

A water-vat having a condensing-trough on the under side of its convex bottom, and provided with tubes for the escape of animal heat from the milk, is set upon a milk-vat.

Claim.—The combination of the milk-pan A, the cooling-pan B with the bottom convex on its under side, the pipes D D, and condensing-trough C, all constructed and used as and for the purposes set forth.

144,573.—Heating-Drum.—ORLANDO D. SPALDING, Mankato, Minn. Application filed August 23, 1873.

Upon the enlarged double conical portion of the stove-pipe rests a shelf, the downwardly-projecting flange of which is perforated for admission of air. The removable cone within the enlargement deflects the heat toward the exterior, and permits the heater to be cleaned.

Claim.—In a stove-drum heater having the cones B and D, the removable inverted cone C and shelf G with the perforated flange G', substantially as described.

144,574.—Process of Painting Signs on Cloth.—ADOLPH STEMPEL, Chicago, Ill. Application filed May 7, 1873.

Claim.—The described process for making signs, consisting in stencilling or painting in water-colors upon muslin or cloth the desired letters, and then, after drying, saturating the sign with oil, as and for the purpose described.

144,575.—Combined Fan and Parasol.—CORNELIUS ST. JOHN, New York, N. Y. Application filed March 8, 1873.

Claim.—1. A combined fan and parasol, consisting of a body, side pieces, beveled inner edges, riveted handle, and friction-pad, combined and arranged for operation substantially as herein shown and described.

2. In a combined fan and parasol having its handle secured to one of the side pieces by a rivet, the friction-pad, arranged substantially as and for the purpose set forth.

144,576.—Dress-Elevator.—CHARLES TAGE, Philadelphia, Pa. Application filed September 16, 1873.

Claim.—The combined bustle and dress-elevator consisting of the piece A, cords B, guides C and F, and buttons G, the parts being constructed and arranged substantially as and for the purpose set forth.

144,577.—Apparatus for the Manufacture of Ice, Cooling Buildings, &c.—AUGUSTUS H. TAFT, Jersey City, N. J. Application filed July 23, 1873.

Air is compressed and cooled, and, as it expands, is passed through water. The water thus cooled is used to cool the air under compression, the object being to produce a very low temperature without having to resort to a very high degree of compression.

Claim.—1. The method of refrigerating by previously cooling the water or other liquid used to cool the compressed air, as set forth.

2. The pump *a*, the pipes *b* and *c*, the vessel *d*, the pipes *e*, *f*, and *g*, the cooler A, the pipes *j* and *i*, the pumps *k* and *l*, or their equivalents, in combination with the cooler *m*, the pump *n*, the pipes *o*, *p*, and *q*, and the chamber A, or their equivalents, as and for the purposes hereinbefore set forth.

144,578.—Hydraulic Car-Brake.—JOHN F. TAYLOR, Charleston, S. C. Application filed June 17, 1873.

Two steam-cylinders and two water-cylinders have an outlet-tube with the same name, so that the introduction of steam in one cylinder results in the expulsion of water from the other. The steam-valves and valve of the water-outlet tube are connected by intermediate mechanism, and operated by the same lever. The piston-rod of the hydraulic engine is connected to the brake-bars. In case the connecting-pipes are broken, a pair of chambers and suitable valve are provided on the air side of the piston.

Claim.—1. The combination of the steam-cylinder A, having the usual steam-chest, piston, and parts, and the water-cylinder B, having the outlet-tube, with the same ram R, so that the introduction of steam in one cylinder results in the expulsion of water from the other.

2. The combination of the cylinder A B and A^1 B^1, provided with rams R R, and connected by tubes D D', as and for the purpose set forth.

3. The combination of the valve C of water-outlet tube D and the steam slide-valve J of chest K, connected by intermediate mechanism, and operated by the same lever H, for the purpose specified.

4. The combination of the cylinders A A^1, rams R R, and cylinders B B^1, connected by tubes D D', with the hydraulic engine A^2 B^2, to operate the brake mechanism of a car or train of cars, arranged as shown, and for the purpose described.

5. The combination, with cylinders A A^1, of engine A^2 B^2 and the air-chambers A^3 A^4, having valve A^5, to enable an air-forcing apparatus to operate the brake at the times and in the manner described.

144,579.—Animal-Carcass-Scraping Machine.—REINELANDER C. TOMPKINS, New York, N. Y. Application filed August 4, 1873.

A rotary endless chain carries projecting scraping-tools. The animal is held and moved on this apron so as to expose all parts of it to the action of the scrapers.

Claim.—The scraping-machine consisting of the endless chain of scraping-tools E E, all as herein shown and described, and for the purpose specified.

144,580.—Heel for Boots and Shoes.—ORSON UNDERWOOD, Milford, Mass. Application filed May 9, 1873.

Claim.—1. The flanged heel A, the plate A', the insole D, and the outer sole E, arranged and connected by means as described.

2. The metallic heel-plate A', separate from the outer sole, the metallic heel A, the vamp or upper C, the insole D, the outer sole E, and the fastening-screw H, all constructed, arranged, and combined substantially as described and represented.

144,581.—Vapor-Generator.—WILLIAM WELLS, Salem, Mass., assignor of one-half his right to DAVID BUFFUM, same place. Application filed October 1, 1873.

A chamber for bisulphide of carbon to assist in the generation of steam is arranged to permit the free circulation of the water between the tubes containing said bisulphide of carbon and the flue-tubes conveying the products of combustion from the fire-box of the furnace.

Claim.—The combination of water-cylinder A and bisulphide-of-carbon chamber D arranged therein, and the two provided with concentric tubes B and E, substantially as and for the purpose specified.

144,582.—Slack-Taking-Up Apparatus for Steam and Air Brakes.—GEORGE WESTINGHOUSE, Jr., Pittsburg, Pa. Application filed September 27, 1873.

The piston-rod of the brake-cylinder is provided with a slotted or bifurcated arm, which plays on the stem connected to the rack-bar, and, as the piston moves, comes against a stop-pin in said stem when sufficient slack has accumulated to be taken up. One of the brake-levers is bifurcated at its outer end, and is attached to the pawl-box by a pin playing in a slot in the rack-bar. The long end of a beat lever is pivoted to the arm on the piston-rod, and is fulcrumed near the bend to brackets on the cylinder, and the short arm has pivoted to it a stem provided with a shoulder, and passing through a guide, between which a coiled spring plays.

Claim.—1. The arm *a*, fixedly connected with the piston-stem *c'*, in combination with the ratchet-bar R and lever *p*, substantially as set forth.

2. The lever *p*, with a suitable connection from its longer arm to or with the piston-stem C', in combination with the rods *o o*, stem *f*, and spring f^2, substantially as set forth.

3. The bifurcated brake-lever B, pivoted to the box A, in combination with the slot *e'* in the ratchet-bar, arranged substantially as described.

144,583.—Tool-Holder and Cutter-Head for Boring-Bars.—JEROME WHEELOCK, Worcester, Mass. Application filed July 2, 1873.

A cylinder-boring cutter-head having three or more slotted arms, upon each of which is mounted a radially-adjustable tool-holder having a cutter hinged thereto to fold inward.

Claim.—A boring-bar tool-holder, fitted to receive the tool and admit of its being advanced from a radial to a tangential line while operatively mounted on the holder, in combination with a cutter-head provided with arms fitted to receive and carry the holder, and with means for effecting the radial adjustment of said holder, substantially as and for the purposes specified.

144,584.—Plow.—EDWARD WIARD, Louisville, Ky., assignor to BENJAMIN F. AVERY, same place. Application filed September 24, 1873.

The runner is attached to the land-side of the plow-beam, and designed to run upon the unplowed land and support the plow in an upright position. It is made adjustable to regulate the depth of furrow.

Claim.—The land-side runner composed of the broad plate A, inclined standard B, angular and oblique brace C, and support D, all pivoted together and adapted for attachment to the land-side of the plow, and when attached is adjustable thereon by means of the slots in the arms of the standard B and brace C', all substantially as set forth.

144,585.—Draft Apparatus for Metallurgic and Other Furnaces.—GEORGE WINGATE, Boston, Mass. Application filed August 12, 1873.

Air, preferably under a slight pressure, enters the annular casing, and, after circulating in the same, passes into the air-chamber, rising into the vertical space surrounding the steam-tubes, becomes heated, and escapes under pressure through the annular passage intervening between the cap and nozzle, producing a partial vacuum in the stack, which facilitates combustion.

Claim.—1. The combination, with a flue or stack, of a series of air tubes or passages communicating with the flue, and arranged substantially as described, so that the air therein is heated and passes as a blast into the stack.

2. A draft-producing apparatus in which air-pipes *b*, contained within the space through which heated products of combustion are caused to pass, are combined with steam heating-tubes *c*, extending longitudinally through the said air-pipes, all substantially as specified.

3. The combination, substantially as described, of the steam-chamber E, its tubes *c*, the air-chamber D, pipes *b*, casings H and G, cap F, nozzle J, and the annular passage *f*, intervening between the said cap and nozzle.

4. The combination, substantially as described, of the air-chamber D and its openings *i* with the exterior annular casing K, whether the latter be fixed or movable.

144,586.—Chimney-Top.—GEORGE WINGATE, Boston, Mass. Application filed August 12, 1873.

In a chimney, having openings in its sides, is placed an inner casing, the upper end of which extends within the lower end of a second casing supported upon the top of the chimney. The passage of air between the first casing and the chimney-walls assists in increasing the draft.

Claim.—The chimney-top consisting of casing D, having a flange, *h*, and the casing B with its flanges *b*, the said casings being adapted for application to a chimney, in the manner set forth.

144,587.—False Bottom for Water-Coolers.—JAMES F. WOOD, Wilmington, Del. Application filed July 19, 1873.

Claim.—The plate D, resting on a spiral spring, C, and arranged to constitute a false bottom for a water-cooler, as set forth.

144,588.—Planing-Machine.—SOLOMON A. WOODS, Boston, Mass. Application filed June 19, 1873.

A planing-machine is provided with a frame having a chip-breaker formed upon its front part and a protector-bar in its rear, said frame being hung concentric with a cutter-cylinder, the construction of the protector-bar being such that a board of any thickness may be easily entered under the presser-roll of the machine.

Claim.—A cutter-cylinder, in combination with the frame *f*, its bar *i h*, and the roller *g*, substantially as shown and described.

144,589.—Apparatus for Conveying Grain.—HENRY G. YATES, Kalamazoo, Mich. Application filed November 7, 1873.

Grain in a heated state is admitted into the cylinder containing the blower, from which it is forced through the conveying-pipe and ejected from the cylinder containing the exhaust-fan attached to the other end of the pipe.

Claim.—The device for drying and removing grain, consisting of the cylinders A B, with their fans, in combination with the tube T, P, and P' and furnace F, all constructed and arranged substantially as and for the purpose set forth.

REISSUE PATENTS.

5,648.—Process and Apparatus for Preserving Animal and Vegetable Substances.—CHARLES ALDEN, Newburg, N. Y.—Patent No. 121,569, dated December 5, 1871. Application filed November 1, 1873.

Claim.—1. The within-described process of maturing and preserving animal and vegetable substances, in part through evaporation, and in part through chemical binding of their organic moisture, by exposing the same to a current of heated and humid air, increasing in humidity and decreasing in heat as the evaporation proceeds, said current of air moving in the same direction with the articles to be treated, substantially as herein set forth.

2. The arrangement of a fan-blower, H, air-chamber G, heating-coil F, and tunnel A, containing a series of rising or falling screens, E, substantially as shown and described.

5,649.—Kaleidoscope.—CHARLES G. BUSH, Boston, Mass., assignor to himself and JOHN W. HOARD.—Patent No. 143,371, dated September 30, 1873. Application filed October 30, 1873.

To the ordinary objects in a kaleidoscope-box are added short glass tubes, having their ends closed by fire-sealing and containing different-colored objects, liquid or solid, immiscible liquids or a single liquid with a bubble. The inclosed articles change their relative positions by gravity as the tubes are shifted about in the box.

Claim.—1. In combination with a kaleidoscope-box, a glass tube or vessel for containing one or more objects, said tube or vessel being closed hermetically without the use of cement or plugging.

2. In combination with a kaleidoscope-box, an object, consisting of a glass tube or vessel containing liquid, and closed hermetically by the fusing of the glass without the aid of cement or plugging.

3. An object for kaleidoscopes, consisting of a glass tube or vessel containing two or more immiscible liquids, or one or more liquids and one or more solids.

5,650.—Skylight.—GEORGE HAYNS, New York, N. Y.—Patent No. 112,504, dated March 14, 1871. Application filed July 12, 1873.

The hollow supporting-bar is contracted below to form the gutters, so that the latter do not offer a material increase of obstruction to the passage of light or to the apparent weight of the bar. A clip is inserted between consecutive panes, having a groove for the reception of the inferior pane, a rabbet for the superior pane, and a gutter extending under the latter to intercept the condensed moisture upon the same. The transom K has cast-iron strengthening-blocks inserted at the ends, the intermediate portion being filled with wood.

Claim.—1. The hollow metallic bar or rafter C^1 or C^2, of a contracted construction toward its center, to form gutters below the supporting-surfaces of the glasses, substantially as specified.

2. The hollow metallic bar or rafter C^1 or C^2, constructed, substantially as described, of plates *a* and *c*, bent to support or connect each other, and to form gutters *b b*, arranged in juxtaposition to each other, and under cover of the base or bases which support the glass, as herein set forth.

3. The clip H, constructed of sheet metal, bent to form a groove, *h*, a rabbet, *i*, and a gutter, *k*, essentially as and for the purpose described.

4. The transom K, made of sheet metal, with cast-iron blocks *n* and intermediate wooden filling *q*, substantially as specified.

5,651.—Manufacture of Whip-Stocks.—DAVID C. HULL, Westfield, Mass.—Patent No. 132,909, dated November 12, 1872. Application filed September 3, 1873.

Claim.—1. A whip-stock composed of a series of rattan strips, D, a heart-piece, B, and a metallic load-piece, A, arranged as set forth, and having the rattan strips surrounding such load-piece, and extended rearward beyond it, substantially as specified.

2. A whip-stock composed of a series of rattan strips, D, a heart-piece, B, a metallic load-piece, A, and a separate wooden backing or plug, C, all arranged substantially as described, and being in order that the butt of the stock may be held and finished by a turning-machine, and the supporting material or surplus portion of such butt be subsequently removed by a saw or other means without interference from the metallic load-piece.

5,652.—Treating Tanned Leather.—BENJAMIN H. LIGHTFOOT, Philadelphia, Pa.—Patent No. 43,120, dated June 14, 1864; reissue No. 5,016, dated July 30, 1872. Application filed October 16, 1873.

Claim.—1. The currying or dressing of tanned leather, by applying to the same petroleum or any mineral oils of sufficient body and gravity, with or without an admixture of fresh or straights oil, substantially as herein described.

2. As a new article of manufacture, leather dressed or curried by the application of petroleum or any mineral oil of sufficient body or gravity, alone or mixed with other substances, as set forth.

3. A mixture for dressing tanned leather, &c., consisting of petroleum or any mineral oil of sufficient body and gravity, and fish-oil, or its equivalent.

5,653.—Vise.—H. K. PORTER and T. W. PORTER, Boston, Mass., assignors, by mesne assignments, to CHARLES PARKER, Meriden, Conn.—Patent No. 72,327, dated December 17, 1867. Application filed June 19, 1873.

Claim.—In combination with the lever B, passing through the head of the screw A, the adjusting-screw *c*, for the purpose of adjusting the pressure upon the said lever, substantially as described.

5,654.—Preparing Wheat and other Grain for Food.—THE NUTRIO MANUFACTURING COMPANY, Philadelphia, Pa., assignee, by mesne assignments, of R. BERKELEY FITTS.—Patent No. 115,947, dated June 13, 1871. Application filed September 18, 1873.

Claim.—1. The process herein set forth for the treatment of grain by the application thereto of steam under pressure, substantially as described, for the purposes specified.

2. The process of treating grain by the application of steam under pressure, followed by dry heat, substantially as described, for the purpose specified.

2. The products of the above-described treatments, produced by the application of steam under pressure, with or without the application of dry heat, as new commercial articles, substantially as described.

5,655.—Preparing Wheat, Corn, and other Grain for Food.—THE NUTRIO MANUFACTURING COMPANY, Philadelphia, Pa., assignee, by mesne assignments, of R. BERKELEY FITTS.—Patent No. 118,165, dated July 18, 1871. Application filed September 18, 1873.

Claim.—1. The process of purifying and cleaning grain by hot or boiling water, substantially as described, for the purpose specified.

2. The process of purifying and cooking grain by hot or boiling water, substantially as described, for the purpose specified.

3. The process of purifying and cooking grain by hot or boiling water, followed by dry heat, substantially as described, for the purpose specified.

4. As a new commercial article, grain treated by hot water alone, or first by hot water, and afterward by dry heat, substantially as described, for the purpose specified.

INDEX OF INVENTIONS PATENTED NOVEMBER 11, 1873.

	Class No.	Whole No.
Animal and vegetable substances, process and apparatus for preserving, C. Alden, (reissue)	58	5,648
Animal carcass scraping machine, R. C. Thompkins	25	144,579
Auger, earth, W. Cole	51	144,510
Bale tie, cotton, A. G. Buford	7	144,502
Balloon advertising, W. F. Browne	54	144,436
Baryta, manufacture of, C. M. T. Du Motay	35	144,517
Bitumen, ore, &c., compound for, P. Lea	153	144,396
Blasting, package of powder charges for, H. M. Boies	124	144,434
Block fitting machine, E. H. Woodsum	173	144,427
Boiler attachment, wash, W. W. Glanville	136	144,531
Bolts, device for rounding the ends of, J. L. Schermerhorn	14	144,569
Boot and shoe heel, O. Underwood	16	144,560
Boot and shoe heel stiffener, S. Moore	16	144,556
Boot and shoe soles, tool for marking edges of, J. W. Dodge	16	144,515
Boring bars, tool holder and cutter head for, J. Wheelock	100	144,563
Box and shopping bag, combined lunch, C. C. Cobleigh	62	144,385
Box, match, J. Matthias	90	144,404
Box opener, M. J. Hinden	29	144,454
Bridge, J. B. Eads	21	144,519
Brush, C. L. W. Baker	22	144,496
Brush handle, lather, W. H. Miles, Jr	22	144,553
Calculating machine, T. Ecersky	42	144,523
Can for fruit, &c., M. Bray	58	144,380
Car brake, E. P. Harrington	122	144,537
Car brake, hydraulic, J. P. Taylor	122	144,578
Car coupling, T. Andrews	122	144,498
Car coupling, A. A. Atwater	122	144,494
Car coupling, R. Butt	122	144,439
Car coupling, C. C. Converse	122	144,386
Car coupling, S. Reed	122	144,476
Car coupling, L. P. Rider	122	144,412
Car coupling, H. G. Russell	122	144,479
Car coupling, M. R. Wood	122	144,490
Car heater, J. H. Weibel	154	144,425
Car steam brake, railway, N. Nilson	122	144,410
Car starter, W. A. Jordan	122	144,546
Car truck, J. Darling	122	144,389
Car wheel, J. R. Atwood	122	144,495
Cars, mechanism for stopping and starting street, J. M. Starr	122	144,484
Carboys, tilting stand for, A. W. Caverly	1	144,442
Card case, postal, Townsend, Hughes, and Keith	146	144,423
Carpet rag looper and button hole cutter combined, Morris and Lenhart	95	144,472
Carpet stretcher, J. Luther	62	144,464
Carriage door, J. Carson	31	144,440
Carriage spring, J. Curtis	31	144,514
Cartridges, implement for capping, H. M. Bronson	32	144,435
Caster for furniture, G. H. Glad	24	144,530
Chair, canopied, T. Elkinton	62	144,521
Chimney top, G. Wingate	166	144,566
Churn, G. G. Buchanan	45	144,437
Cigar point splitter, A. Sickenberger	160	144,570
Cigarette machine, J. De S. Ruiseco	160	144,478
Clock, calendar, Clinton and Mood	36	144,384
Clothes line reel, G. F. Corliss	91	144,367
Coal, machine for cutting, Gillott and Copley	194	144,529
Cock, reaking, A. Reos	167	144,565
Cocks, machine for dressing metal, H. Essex	100	144,524
Compressor, air, H. H. Day	2	144,300
Cooler, milk, C. A. Douglass	45	144,448
Cooler, milk, D. Smith	45	144,572
Coolers, false bottom for water, J. F. Wood	58	144,567
Cotton opener, R. Kitson	28	144,304
Cradle, C. A. Feaner	62	144,391
Culinary utensil, H. G. Dunkelberger	66	144,518
Cultivator, rotary, J. D. Starritt	43	144,419
Curling iron, J. S. Morgan	161	144,471
Dental tool rack, G. E. Hayes	46	144,539
Dividers, extension, G. C. Miller	97	144,468
Dovetail cutting machinery, W. T. Hamilton	173	144,536
Drill, grain, S. Hart	133	144,452
Drill for well boring, Phillips and Golletz	124	144,475
Drill, well, G. Koch	124	144,550
Edge trimming and burnishing machines, jack center for, Orr and Sears	16	144,500
Egg beater, J. F. Reto	68	144,567
Elevator, dress, C. Tago	38	144,576
Engine, paper pulp, Moore and Hurlburt	108	144,557
Engine, rotary, E. Myers	150	144,559
Engine slide valve, steam, W. Love	152	144,463
Engine, traction, E. M. Mendenhall	94	144,467
Engine valve, direct acting, H. A. Jamieson	152	144,545
Fan, automatic, W. B. Campbell	165	144,505
Fan and parasol combined, C. St. John	165	144,575
Faucet, Dell and Elling	167	144,516
Faucet, S. B. Thompson	167	144,422
Faucet, beer and ale, J. Deasey	167	144,447
Fence, J. Gray	58	144,534
Fertilizer distributer, J. Lytch	133	144,465
Fire extinguisher, automatic, E. H. Asheroft	116	144,429
Fire place front, E. A. Jackson	154	144,459
Fire place lining, E. A. Jackson	154	144,460
Flowers, artificial stem for cut, J. B. Craig	54	144,446
Food for infants from cereals, L. S. Chichester	39	144,506
Fruit loosener, dried, H. W. Holman	58	144,542
Furnace for the manufacture of gas, &c., F. Carroll	66	144,506
Furnace, steam boiler, S. Keyes	149	144,393
Furnaces, bridge wall for, S. C. Sturtevant	149	144,421
Furnaces, draft apparatus for metallurgic, &c., G. Wingate	99	144,585
Gage, alarm, and register, electrical water, C. Heisler	148	144,540
Gas, apparatus for the manufacture of hydrogen, W. L. Imlay	66	144,543
Gas retorts, apparatus for charging and drawing, W. Foulis	66	144,526
Gas seal, &c., R. M. Caffall	66	144,504
Gas works by pass, P. Munzinger	66	144,408
Generator, vapor, W. Wells	148	144,581
Grain cleaner, W. Houghton	57	144,455
Grain conveying apparatus, H. G. Yates	79	144,589
Grain weigher, automatic, J. W. Hill	128	144,541
Grave mound cover, B. Hunter	54	144,392
Harvester, lifting finger for, A. Hughes	74	144,457
Hatchway guard, automatic, Berry and Pingree	30	144,432
Head block, P. M. Cummings	130	144,388
Heater, car, J. H. Weibel	154	144,425
Heater, steam, W. M. Fuller	147	144,587
Heating and illuminating, apparatus for, L. Ruel	90	144,414
Heating drum, O. D. Spalding	154	144,573
Horseshoe, U. Snyder	60	144,483
Hose rest, garden, C. Ryder	63	144,415
Ice, cooling buildings, &c., apparatus for manufacture of, A. H. Taft	83	144,577
Iron, &c., with protecting alloys, coating, C. Marshall	113	144,403
Jewel case, C. Beck	86	144,431
Kaleidoscope, C. G. Bush, (reissue)	157	5,649
Key cap for key board instruments, J. P. Lord	112	144,399
Kiln, lime, L. Montgomery	153	144,555
Lantern, signal, S. H. Miller	90	144,554
Lawn seat, H. H. Gratz	62	144,533
Leather, tanning, R. Blake	92	144,500
Leather, treating tanned, B. H. Lightfoot, (reissue)	92	5,652
Life preserving cape, G. and C. Palmer	138	144,561
Loom temple, N. Chapman	95	144,507
Mattress, wire, D. J. Powers	62	144,564
Medical compound, D. J. McEvoy	98	144,405
Mill, hominy, J. L. Toner	57	144,486
Molding machine, stair rail, J. B. Margeeon	173	144,402
Nail distributer, A. Morrison	103	144,407
Nut lock, E. A. Cooper	14	144,511
Oil cake mold, R. Macdonald	98	144,400
Organ, reed, R. Burdett	106	144,382
Organ, reed, W. J. Kent	106	144,549
Organ reed, reed, M. O. Nichols	106	144,409
Pan, baking, C. T. Smith	154	144,417
Paper box fastening, D. A. Crannell	109	144,513
Paper file, M. Craft	146	144,512
Paper product, J. L. Kendall	106	144,548
Partition, fire proof, C. F. Brand	30	144,501
Plane, bench, Brown and Williams	29	144,381
Planing machine, S. A. Woods	173	144,588
Planter, cotton and corn, A. Pennington, Jr	133	144,562
Planter, hand corn, M. C. Root	133	144,566
Planter, hand corn, J. O. Talmage	133	144,485
Plastic material from mineral substances, P. Lea	99	144,397
Plow, J. Blanchard	114	144,433
Plow, J. L. Laughlin	114	144,462
Plow, W. C. McCool	114	144,558
Plow, A. Riviere	114	144,477
Plow, E. Wiard	114	144,584
Plow, cotton scraping, J. M. Cobb	43	144,509
Plow, subsoil, Turner and Jacobs	114	144,487
Plow, wheel, F. Hasbrook	114	144,453
Polishing compound, E. J. Combs	70	144,444
Press, wine, E. Howland	19	144,456
Printers' rules, miter box for cutting, T. H. Mead	117	144,466
Printing plates, removing ink from engraved, J. S. Ives	117	144,544
Propeller, steering, W. Harsen	139	144,536
Propelling vessels, J. O'Neil	139	144,474
Puddler, rotary, W. and G. H. Sellers	65	144,416
Railway signals, circuit breaker for electric, D. Rousseau	59	144,568
Railway switch, J. B. Alexander	120	144,379
Rattan ware, S. H. Penley	109	144,563
Ribbon block, T. Ehrenberg	54	144,520
Road trimmer, B. Goodrich	51	144,532
Roller, land, W. Williams	73	144,490
Safes, fire escape for, C. Morgan	128	144,470
Sash fastener, O. H. Gilbert	24	144,451
Sash fastener, L. D. Gillette	24	144,528
Saw filing machine, J. J. Engelman	131	144,522
Saw sharpening machine, T. M. Chapman	131	144,383
Sawing machine, wood, J. Skinner	130	144,482
Sewing machine cutting attachment, W. H. Sample	134	144,480
Sewing machine shuttle, J. Knox	134	144,395
Sifter, ash, L. Marsh	154	144,466
Signs on cloth, painting, A. Stempel	146	144,574
Skylight, G. Hayes, (reissue)	30	5,650
Snow and ice from roadways, &c., machine for removing, C. G. Westerbury	122	144,488
Soap cutting machine, J. Selbert	28	144,481
Speed of machinery, device for changing, A. Botts	67	144,498
Staples, machine for pointing, W. Mallek	103	144,401
Steam and air brake slack taking up apparatus, G. Westinghouse, Jr	122	144,582
Stills, N. U. Aimée	143	144,491
Stones, machine for cutting cobble, Lombard, Merrill, and Sweatt	153	144,398
Stool, office and counting house, A. D. Cartwright	62	144,441
Stove, base burning, S. H. Le Rue	154	144,467
Stove, portable, R. Moore	154	144,469
Table, buffet, W. H. Tufts	62	144,484
Table, ironing, W. H. Sparks	91	144,418
Telegraph, district, and fire-alarm, J. H. Guest	59	144,535
Tenoning machine, J. Richards	173	144,411
Thill coupling, J. C. Barrett	31	144,497
Thill, vehicle, A. Muhleisen	31	144,559
Ticket case, J. Stokes, Jr	62	144,420
Tobacco hanger, Burr and Johnson	160	144,503
Treadle, W. Felser	67	144,535
Tubing, machine for bending, W. T. Farre	125	144,449
Type, manufacture of printing, J. Silversmith	164	144,571
Type writing machine, J. Galloway	117	144,450
Valve, balance slide, C. H. Hutchinson	152	144,458
Vehicle, M. V. Nichols	31	144,473
Velocipede, J. F. McClure	31	144,551
Ventilator, window, L. Robinson	166	144,419
Vise, H. K. and T. W. Porter, (reissue)	99	5,653
Wagon brake, B. W. Coe	31	144,443
Wagon end gate, Baird and Miller	31	144,439
Wagon seat, T. J. Alexander	31	144,492
Wagons, &c., spring seat for, Weyand and Hill	31	144,486
Warmer, foot, J. B. Craig	154	144,445
Watchmaker's lathe, E. H. Kelly	36	144,547
Water meter, automatic, F. de P. Bellido	167	144,498
Wheat, &c., for food, preparing, R. B. Fitts (reissue)	58	5,654
Wheat, &c., for food, preparing, R. B. Fitts, (reissue)	58	5,655
Whip stocks, manufacture of, D. C. Hull, (reissue)	73	5,651
Window, G. M. Barth	39	144,430
Wood molding, L. Bushnell	54	144,438

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED NOVEMBER 11, 1873.

Aiken, A. J., assignee		144,546
Ainée, N. U., Stilts		144,491
Alden, C., Process and apparatus for preserving animal and vegetable substances, (reissue)		5,648
Alexander, J. B., Railway switch		144,379
Alexander, T. J., Wagon seat		144,492
Andrews, T., Car coupling		144,498
Ashcroft, E. H., Automatic fire extinguisher		144,429
Atwater, A. A., Car coupling		144,494
Atwood, J. R., Car wheel		144,495
Avery, R. F., assignee		144,584
Bailey Tool Company, assignee		144,361
Baird, J. C., and M. Miller, End gate for wagons		144,439
Baker, C. L. W., Brush		144,496
Barrett, J. C., Thill coupling		144,497
Barth, G. M., Window		144,430
Beck, C., Jewel case		144,431
Ballido, F. de P., Automatic water meter		144,498
Berry, G. E., and F. C. Pingree, Automatic hatchway guard		144,432
Botts, A., Device for changing the speed of machinery		144,498
Blake, R., Tanning leather		144,500
Blanchard, J., Plow		144,433
Boies, H. M., Package of powder charges for blasting		144,434
Brand, C. F., Fire proof partition		144,501
Bray, M., Can for fruit, &c		144,380
Bronson, H. M., Implement for capping cartridges		144,435
Brown, W. H., and D. F. Williams, Bench plane		144,261
Browne, W. F., Balloon advertising		144,436
Brumbeugh, D. H., assignee		144,502
Buchanan, G. G., Churn		144,437
Buford, A. G., Cotton bale tie		144,502
Buffalo Dental Manufacturing Company, assignee		144,539
Buffum, D., assignee		144,561
Burdett, R., Reed organ		144,382
Burr, D. C., and J. A. Johnson, Tobacco hanger		144,503
Bush, C. G., Kaleidoscope, (reissue)		5,649
Bushnell, L., Wood molding		144,438
Butt, R., Car coupling		144,439
Caffall, R. M., Gas seal, &c		144,504
Campbell, W. B., Automatic fan		144,505
Carroll, F., Furnace for the manufacture of gas, and for other purposes		144,506
Carson, J., Carriage door		144,440
Carter, H. W., assignee		144,433
Cartwright, A. D., Office and counting house stool		144,441
Caverly, A. W., Tilting stand for carboys		144,442
Chapman, N., Loom temple		144,507
Chapman, T. M., Saw sharpening machine		144,383
Chichester, L. S., Food for infants from cereals		144,506
Clinton, C. M., and L. Mood, Calendar clock		144,384
Cobb, J. M., Cotton scraping plow		144,509
Cobleigh, C. C., Combined lunch box and shopping bag		144,385
Coe, B. W., Wagon brake		144,443
Cole, W., Earth auger		144,510
Combs, E. J., Polishing compound		144,444
Converse, C. C., Car coupling		144,386
Cooper, E. A., Nut lock		144,511
Copley and Gillott		144,529
Corliss, G. F., Clothes line reel		144,367
Cowl, A. E., assignee		144,497
Craft, M., Paper file		144,512
Craig, J. B., Foot warmer		144,445
Craig, J. B., Artificial stem for cut flowers		144,446
Crannell, D., Paper box fastening		144,513
Cummings, P. M., Head block		144,388
Curtis, J., Carriage spring		144,514
Darling, J., Railway car truck		144,389
Day, H. H., Air compressor		144,300
Deasey, J., Beer and ale faucet		144,447
Demers, J., assignee		144,414
Dodge, J. W., Tool for marking edges of boot and shoe soles		144,515
Dell, A., and C. Elling, Faucet		144,516
Douglass, C. A., Milk cooler		144,448
Du Motay, C. M. T., Manufacture of baryta		144,517
Duncan, H. L., assignee		144,398
Dunkelberger, H. G., Culinary utensil		144,518
Dunning, L. C., assignee		144,444
Eads, J. B., Bridge		144,519
Ehrenberg, T., Ribbon block		144,520
Elkinton, T., Canopied chair		144,521
Elling and Dell		144,516
Engelman, J. J., Saw filing machine		144,522
Ecersky, T., Calculating machine		144,523
Essex, H., Machine for dressing metal cocks		144,524
Farre, W. T., Machine for bending tubing		144,449
Felser, W., Treadle		144,535
Feaner, C. A., Cradle		144,391
Fitts, R. B., Preparing wheat, &c., for food, (reissue)		5,654
Fitts, R. B., Preparing wheat, &c., for food, (reissue)		5,655
Folk, J. E., assignee		144,554
Foulis, W., Apparatus for charging and drawing gas retorts		144,526
Freund, A., assignee		144,454
Fuller, W. M., Steam heater		144,527
Galloway, J., Type writing machine		144,450
Gilbert, O. H., Sash fastener		144,451
Gillette, L. D., Sash fastener		144,528
Gillott, J., and P. Copley, Coal cutting machine		144,529
Glad, G. H., Furniture caster		144,530
Glanville, W. W., Wash boiler attachment		144,531
Gollets and Phillips		144,475
Goodrich, B., Road trimmer		144,532
Gorham Manufacturing Company, assignee		144,431
Gratz, H. H., Lawn seat		144,533
Gray, J., Fence		144,534
Guest, J. H., District and fire alarm telegraph		144,535
Hamilton, W. T., Machinery for cutting dovetails		144,536
Harrington, E. P., Car brake		144,537
Harsen, W., Steering propeller		144,538
Hart, S., Grain drill		144,452
Hasbrook, F., Wheel plow		144,453
Hayes, G., Skylight, (reissue)		5,650
Hayes, G. E., Dental tool rack		144,539
Heisler, C., Electrical water gage, alarm, and register		144,540
Herchelrode, C., assignee		144,541
Hill, J. W., Automatic grain weigher		144,541
Hill and Weyand		144,486
Hinden, M. J., Box opener		144,454
Hoard, J. W., assignee, (reissue)		5,649
Hoe, R., & Co., assignee		144,498
Holman, H. W., Dried fruit loosener		144,542
Houghton, W., Grain cleaner		144,455
Howland, E., Wine press		144,456
Hughes, A., Harvester lifting finger		144,457
Hughes, Keith, and Townsend		144,423
Hull, D. C., Manufacture of whip sockets, (reissue)		5,651
Hunter, B., Grave mound cover		144,392
Hurlburt and Moore		144,557
Hutchinson, C. H., Balanced slide valve		144,458
Imlay, W. L., Apparatus for the manufacture of hydrogen gas		144,543
Ives, J. S., Removing ink from engraved printing plates		144,544
Jackson, E. A., Fire place front		144,459
Jackson, E. A., Fire place lining		144,460
Jacobs and Turner		144,487
Jamieson, H. A., Valve for direct acting engines		144,545
Johnson and Burr		144,503
Jordan, W. A., Car starter		144,546
Keith, Townsend, and Hughes		144,423
Kelly, E. H., Watchmaker's lathe		144,547
Kendall, J. L., Paper product		144,548
Kent, W. J., Reed organ		144,549
Keyes, S., Steam boiler furnace		144,393
Kitson, R., Cotton opener		144,304
Knox, J., Sewing machine shuttle		144,395
Koch, G., Well drill		144,550
La Rue, S. H., Base burning stove		144,461
Laughlin, J. L., Plow		144,462
Lea, P., Compound for bitumen, ore, &c		144,396
Lea, P., Plastic material from mineral substances and clay		144,397
Lenhart and Morris		144,472
Lightfoot, B. H., Treating tanned leather, (reissue)		5,652
Lombard, H., J. P. Morrill, and L. A. Sweatt, Machine for cutting cobble stones		144,398
Lord, J. P., Key cap for key board instruments		144,399
Love, W., Steam engine slide valve		144,463
Luther, J., Carpet stretcher		144,464

Lytch, J., Fertiliser distributer 144,465
Macdonald, R., Mold for oil cakes 144,400
Malick, W., Machine for pointing staples 144,401
Maley, J. C., assignee 144,468
Manning, F., assignee 144,470
Margeson, J. B., Stair rail molding machine 144,402
Marsh, L., Ash sifter 144,466
Marshall, C., Coating iron, &c., with protecting alloys 144,403
Mason, J. L., assignee 144,496
Matthias, J., Match box 144,404
McClure, J. F., Velocipede 144,551
McConnico, J., assignee 144,502
McCool, W. C., Plow 144,552
McEvoy, D. J., Medical compound or salve 144,405
McNair, W. W., assignee 144,410
Mead, T. H., Miter box for cutting printers' rules 144,406
Mendenhall, N. M., Traction engine 144,467
Miles, W. H., Jr., Lather brush handle 144,553
Miller, G. C., Extension dividers 144,468
Miller, S. H., Signal lantern 144,554
Miller and Baird 144,469
Montgomery, L., Lime kiln 144,555
Moot and Clinton 144,394
Moore, S., Boot and shoe heel stiffener 144,356
Moore, S., and R. H. Hurlburt, Paper pulp engine 144,557
Moore, R., Portable stove 144,469
Morgan, C., Fire escape for safes 144,470
Morgan, J. S., Curling iron 144,471
Morrill, Sweatt, and Lombard 144,398
Morris, G. W., and W. Lenhart, Combined carpet rag looper and button hole cutter 144,472
Morrison, A., Nail distributer 144,407
Muhleisen, A., Vehicle thill 144,558
Munzinger, P., By-pass for gas works 144,408
Myers, E., Rotary engine 144,559
Newman, L., assignee 144,555
Nichols, M. O., Reed organ reed 144,409
Nichols, M. V., Vehicle 144,473
Nilson, N., Steam brake for railway cars 144,410
Nutrie Manufacturing Company, assignee, (reissue) 5,654, 5,655
O'Neil, J., Means of propelling vessels 144,474
Orr, T. M., and A. R. Sears, Jack center for edge trimming and burnishing machine 144,560
Palmer, G. and C., Life preserving cape 144,561
Parker, O., assignee, (reissue) 5,653
Pennington, A., Jr., Cotton and corn planter 144,562
Penley, S. H., Rattan ware 144,563
Phillips, T., and J. Gollets, Drill for well boring 144,475
Pingree and Berry 144,432
Porter, H. K. and T. W., Vise, (reissue) 5,653
Powers, D. J., Wire mattress 144,564
Pratt, C. A., assignee 144,560
Reed, S., Car coupling 144,476
Richards, J., Tenoning machine 144,411
Richards and Fox, assignees 144,464
Rider, L. P., Car coupling 144,412
Riviere, A., Plow 144,477
Robinson, L., Window ventilator 144,413
Rogers, H., assignee 144,556
Rose, A., Rocking cook 144,565
Rost, M. C., Hand corn planter 144,566
Rote, J. F., Egg beater 144,567
Rousseau, D., Circuit breaker for electric railway signals 144,568
Rust, L., Apparatus for heating and illuminating 144,414
Ruisco, J. De S., Cigarette machine 144,478
Russell, H. G., Car coupling 144,479
Ryder, C., Garden hose rest 144,415
Sample, W. H., Sewing machine cutting attachment 144,460
Sauer, A., assignee 144,430
Schermerhorn, J. L., Device for rounding the ends of belts 144,569
Sears and Orr 144,560
Seibert, J., Soap cutting machine 144,481
Sellers, W., and G. H., Rotary puddler 144,416
Shoe Machinery Manufacturing Company, assignee 144,515
Siekenberger, A., Cigar point splitter 144,570
Silversmith, J., Manufacture of printing type 144,571
Skinner, J., Weed sawing machine 144,462
Smith, C. T., Baking pan 144,417
Smith, D., Milk cooler 144,572
Smith, W. C., assignee 144,563
Snyder, U., Horseshoe 144,463

BOUND VOLUMES OF PATENTS.

The Office is now prepared to furnish to subscribers the monthly volumes of patents at $125.00 per annum, bound in half-sheep.

In these volumes the specifications are in full, the type of the same size as the printed patents and records; the drawings are in full, but are one-half the size (linear) of those attached to the patents and bound up for record; the illustrations are four on a page, but *fac-similes* of the originals, with the headings and signatures.

The volumes are the same size as the patents and the OFFICIAL GAZETTE, and have an average of 800 pages of specifications, 200 of drawings; total of each volume about 1,000 pages. They commenced with the issue of July 2, 1872, being the successors in this form of the weekly volumes of patents published under the joint resolution of Congress, passed January 11, 1871, which discontinued the publication of the illustrated annual report of the Commissioner of Patents, and provided for the publication in lieu thereof of complete copies of the specifications and drawings of patents issued subsequently to June 30, 1869. Under this resolution the volumes were to be placed for free public inspection in the capital of each State and Territory of the United States, and in the clerk's office of certain of the federal courts. The Commissioner is also authorised by the resolution to "furnish a complete set of such specifications and drawings to any public library which will pay for binding the same into volumes to correspond with those in the Patent Office, and for the transportation of the same, and which shall also provide proper custody for the same, with convenient access for the public thereto, under such regulations as the Commissioner shall deem reasonable."

After filling the requisition as provided above, a surplus remains which the Commissioner now offers at the rate of $125.00 per annum—say, 1,000 pages per month: 9,000 pages of specifications, 3,190 pages of drawings—12,790 pages.

TO CORRESPONDENTS.

Persons ordering drawings of patents, or making inquiries in regard to patents, must always state the name of the inventor, subject-matter, and date. In making inquiries in regard to applications for patents letters must state the name of the applicant, subject-matter, and date of filing. In ordering drawings by classes, under the subject-matter index of September, 1871, (furnished gratis on application,) it will be understood that the Office cannot take upon itself to make selections of certain lines of inventions, embracing portions only of the patents in the classes as specified. The number of classes has been made as ample as the conduct of the business in this office will readily permit. An order should, therefore, embrace the entirety of a given class or classes. They cannot be subdivided unless ordered specifically by number, name, and date.

The cheapness of the copies, and the comparatively small number of patents in each of the one hundred and seventy-six classes, render an order by class by no means an onerous undertaking.

FINAL FEES.

The final fee upon a patent must be paid within six months after the time at which the application was allowed and notice thereof mailed to the applicant or his agent. And if the final fee for such patent or a certificate of deposit for the amount be not received at the Office within that time, the patent will be forfeited, and the invention therein described will become public property, as against the applicant therefor, unless he shall make a new application within two years from the date of notice of the original allowance.

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 21. TUESDAY, NOVEMBER 18, 1873. PRICE { $6,00 per year—single. / $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

DIGEST OF FOREIGN PATENT LAWS.

SWITZERLAND.

REPORT BY MR. GOULD, OF THE BRITISH LEGATION.

In the Swiss confederation there are, as a general rule, no special laws for the encouragement and protection of inventors. Consequently, the practice does not exist, as in most other countries, of securing to inventors by Letters Patent the monopoly of their inventions for a limited term of years. Public opinion in this confederation is so opposed to the above practice that an attempt made some years ago to bring the subject before the National Assembly proved a complete failure, owing to the marked disfavor with which it was treated on all sides. The accepted theory seems to be that inventions should be considered as common property, and that whatever benefits they may confer should, without delay or restriction of any sort, be extended to the whole community. The only exception to the preceding rule is to be found in the canton of Tessin, where the local government has the power to grant, in consideration of a payment of a sum of from £2 to £20, equal to, say, $10 to $100, the exclusive privilege of working a patent within its territory.

It does not, however, follow that manufacturers are in like manner denied the advantages to be derived from the use of trade-marks for the purpose of distinguishing their manufactures from all others. Yet, even in this instance are there no legal enactments for the protection of trade-marks either in the laws of the confederation or in those of the great majority of the cantons, such as Berne, Zurich, Lucerne, Uri, Schwyz, Upper Unterwald, Lower Unterwald, Glaris, Zug, Friburg, Soleure, Basle Town, Basle Country, Appenzell Within, St. Gall, Argovie, Thurgovie, Vaud, Vallais, Neufchâtel, and Grisons.

In the canton of Schaffhausen, Article 237 of the penal code ("Strafgesey") lays down that, whosoever fraudulently makes use of a manufacturer's stamps, trade-marks, &c., whether such manufacturer be a citizen of the canton or of other cantons or foreign states with which reciprocity in this respect has been established by treaty, will be liable to imprisonment for a term not exceeding three months, or to a fine.

Article 255 of the code of the same canton further enacts that, whoever, with the object of injuring others, or of deriving advantage, whether for himself or for third parties, dishonestly obtains knowledge of the trade or business secrets of others, and appropriates or discloses them; or again, whoever, notwithstanding distinctly-stipulated engagements on his part, acts to the prejudice of his employers while in their service, or even after having left it, will, on the information of the parties concerned with him in proceedings of this nature, or prejudiced by them, be condemned to imprisonment for a term of not more than six months, or to a fine not exceeding 1,000 francs, equal to, say, $200.

The canton of Appenzell Without has in the 26th article of the law of October 28, 1860, defined the rights of manufacturers in the following terms:

The designs (patterns) of manufacturers are to be considered as their exclusive property, and it is unlawful to imitate them. In the same manner a manufacturer or artisan who causes his goods or the products of his workmanship to be known by a particular distinguishing mark, seal, stamp, or label with his name on it, acquires thereby a proprietary right, in the sense that no one else can use the same mark.

Any one infringing the preceding enactment will be fined, and can be called upon to pay an indemnity.

A law of the canton of Geneva of the 10th of April, 1862, contains the following provisions:

ARTICLE 1. The use of trade-marks is optional. Nevertheless, with regard to certain products, the law may exceptionally declare the use of such marks to be obligatory.

ART. 2. Are considered as trade-marks: Names under a distinctive form, denominations, emblems, impressions, stamps, seals, vignettes, reliefs, letters, ciphers, wrappers, and all other signs serving to distinguish the products of a manufactory or the articles dealt in by a firm.

ART. 3. No one can claim the exclusive right to a trade-mark unless he has lodged two models of the trade-mark at the office of the tribunal of commerce.

ART. 4. The right to a trade-mark is limited to fifteen years; but it can be extended for a fresh term of similar duration by renewing the formality prescribed in Article 3.

ART. 5. Are considered guilty of wrongfully appropriating a trade-mark all such as—

1. Counterfeit a trade-mark or make use of a forged trade-mark;

2. Fraudulently affix to their goods trade-marks belonging to others;

3. Knowingly sell or expose for sale goods with a trade-mark, either counterfeited or fraudulently affixed.

ART. 6. Can be prosecuted as guilty of the same offense—

1. All those who, without actually counterfeiting a trade-mark, have fraudulently copied it in a way to mislead the purchaser, or have used a trade-mark thus fraudulently imitated;

2. Those who make use of a trade-mark bearing signs tending to deceive the purchaser as to the nature of the goods;

3. Those who knowingly sell or expose for sale goods with a trade-mark fraudulently imitated or bearing signs tending to deceive the purchaser as to the nature of the goods.

The complainant who brings an action in virtue of the present article will have to prove the fraud or fraudulent intent of the defendant.

ART. 7. The offense of wrongfully appropriating trade-marks will be dealt with, as regards the criminal action, in the light of an attempt to defraud the purchaser with respect to the nature of the goods sold, and entail the penalties prescribed by Article 423 of the criminal code.

ART. 8. The courts will only take cognizance of facts relating to the wrongful appropriation of trade-marks at the instance of the parties interested.

ART. 9. Parties whose trade-marks have been improperly made use of may institute a criminal prosecution by addressing a complaint to the courts, or may confine themselves to bringing a civil action for damages. The provisions of this law of the canton of Geneva on trade-marks are reproduced and amplified in the convention with France, signed on the 30th of June, 1864, which secures to Swiss citizens, by the 14th article, the same rights in France as are enjoyed by French subjects in their own country. The protection thus afforded to trade-marks is also extended to patterns, on the condition, however, that they shall not have become public property in Switzerland, but without any restriction as to the place of manufacture. In like manner, French trade-marks and patterns enjoy special protection throughout the whole confederation. The 31st Article of the above convention lays down that, in Switzerland, the penalty for counterfeiting or using counterfeited French trade-marks shall be a fine of from 50 francs to 3,000 francs, equal to $10 to $600, and imprisonment for a term of from three months to three years, or only one of these two penalties; and, according to the 32d article, for the minor offense of imitating a French trade-mark so as to deceive purchasers with regard to the nature of the goods, or of using one so imitated, the penalty shall be a fine of from 50 francs to 200 francs, equal to $10 to $40, and imprisonment for from one month to a year, or only one or the other. It is further stipulated by the 33d article that, even in cases of acquittal, the court may order the confiscation of the goods for the benefit of the parties defrauded, independently of their right to claim further compensation for the losses they may have thereby sustained. In every case the court shall order the forged trade-marks or the imitation of them to be destroyed. By Article 34, all the dispositions relating to trade-marks are extended to wines, brandies, and all other beverages; cattle, grain, flour, and all agricultural produce in general.

Article 37 confers also the exclusive right to designs (patterns) for a period of one, two, or three years from the date of the deposit of the pattern having been properly effected; but it may always be extended for further periods of three years by renewing the deposit, which may be made publicly or even in a sealed envelope. The latter is not to be opened before the expiration of a year.

According to the 39th article the only conditions requisite to obtain the privilege are that, first, the pattern shall be new; and, second, that the goods of that pattern shall not have been dealt in previously to the deposit.

The pains and penalties incurred for infractions of Article 37 are, as regards the imitator, a fine of from 100 francs to 2,000 francs, equal to $20 to $400; and, as regards the seller, a fine of from 25 francs to 500 francs, equal to $5 to $100, both parties being equally liable for the damages, and their goods to confiscation. Hence the strange anomaly presents itself that, whereas in Switzerland there are no special laws, except in three cantons, for the protection of Swiss trade-marks and patterns, those of French manufacturers and merchants are surrounded by every possible guarantee, and that the former enjoy privileges in France which are denied to them in their own country.

It may, perhaps, be as well to state here that, by an agreement come to in February, 1857, between the cantons of Zurich, Berne, Uri, both the Unterwalds, Glaris, Basle Town and Country, Schaffhausen, Appenzell Within, Grisons, Thurgovie, Tessin, Vaud, and Geneva, as well as Argovie and Appenzell Without, which joined the others in 1861, all works of art and literature are held to be the exclusive property of their authors during their lifetime, and in some special cases even beyond that period, within the respective territories of the cantons, parties to the above agreement. The same principle is recognized and embodied in great detail in the convention with France of the 30th June, 1864, which has previously been referred to.

COMMISSIONER'S DECISIONS.

SAMUEL S. MCNAUGHTON.—*Appeal.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the application of Samuel S. McNaughton, for patent for* REGISTERED COUPON TICKET.—*Decided November* 19, 1873.]

Patentability, in a conductor's ticket-book having overlying leaves similarly marked for punching, one of which is to be detached as a passenger-ticket and the other to remain as a voucher: *Held*, that the mere addition of more indicating-marks for punching than had before been used was not invention.

Also, where such leaves have been detachably connected at one side and one end: *Held*, that, as no improved result was effected, it was not a material change to connect them at opposite ends.

THACHER, *Acting Commissioner:*

The claim in this case is—

The conductor's account and general ticket book described, consisting of consecutive connected detachable full-fare ticket-leaves, and undetachable record-leaves, overlying each other, and provided, respectively, with corresponding columns of duplicate figures to indicate the stations and the difference between a ticket and cash receipt, (the names of the stations being printed on the ticket-leaf only,) and with corresponding superposed symbols to relieve the conductor of the full-fare responsibility in case of excess or deficit in his return of tickets and cash, all marks being made by the conductor's punch alone, substantially as specified.

The applicant has connected the leaves of his check-book in a different manner from that heretofore employed, having in view the convenient punching of both leaves at once and the removal of the ticket-leaf, the record or voucher leaf remaining as in books already patented and in use. He has also added to the number of words and figures on the leaves, by which additional matters are indicated beyond what has been done heretofore in a single instance in similar check-books. His check-book is adapted to indicate separately a greater number of facts than others, in the same way that has been practiced in the use of others—viz., by punching. The first matter, relating to the connection of the leaves to facilitate their use for the purpose intended, might undoubtedly furnish good ground for a patent, provided there was presented a substantial difference of plan from any preceding. But the second, consisting merely of the addition of indicating-marks (whether in figures or colors) to be punched, could not. Such additions are not inventions, for they introduce no new principle. Where there are, for instance, coincident figures, on duplicate leaves, to be punched, indicating the days of the month, it is no invention to add other figures to be punched, indicating the days of the week. This point of difference, therefore, although admitted, may be dismissed as clearly immaterial.

The only question is whether the difference in the connection of the leaves, shown by the applicant, from that of Jebb and others, is a patentable one.

Applicant forms his leaves by folding a strip, cut to make two leaves, in the middle, and binding the two opposite ends of the strip together. The bound leaves are thus connected at their inner ends by the binding and at their outer by the fold. The fold is perforated, as is the removable or passenger-ticket leaf near its inner end, to admit of its ready removal. Jebb's leaves are also formed of a suitable strip folded in the middle; but they are bound so that the fold, which is also perforated, shall be at the sides instead of at the outer ends of the leaves. They are perforated near their inner ends like the applicant's, so that one of them for the passenger may be readily detached. No improved result being made to appear, I cannot regard this as a substantial difference of construction.

The decision of the Board is, therefore, affirmed.

EATON, BLODGETT, AND MILLS.—*Appeal.*

[*Appeal from the decision of the Primary Examiner in the matter of the application of Eaton, Blodgett, and Mills, for* IMPROVEMENT IN SHUTTLES.—*Decided November* 19, 1873.]

Practice under Rule 11 requiring a supplemental oath.

Any modifications of claim justly within the original sworn statement of the invention or claims are allowable without a supplemental oath; but the original claims, as a rule, constitute the inventor's real estimate of what is his invention, and are what he intends to substantiate as such by his oath.

The oath refers to the original specification and claims as illustrated by special reference to the drawings, and has no reference to the model. Where the invention subsequently claimed by amendment was shown in the model but not originally shown in the drawings or referred to in the specification: *Held*, that a supplemental oath was necessary.

The oath of an applicant is not a mere formal matter, but is required by act of Congress, because it goes to assure the novelty and utility of the invention. Followed by an official examination it gives *prima facie* validity to a patent.

THACHER, *Acting Commissioner:*

This invention was stated in the original specification to relate "to shuttles;" and to consist "of a novel construction and arrangement of the spindle and shuttle-body—the spindle having a notch in its head instead of a round hole, with which it bears on the pin, the pin being stationary in the shuttle, and the shuttle having a set-screw which bears on the spindle-head, and thereby regulates its position." The object of the invention was stated to be "to avoid the danger of splitting the shuttle by repeated removing and refastening of the pin which holds the spindle-head, * * * * * and to have a counter bearing against the spindle-head, which is adjustable." Four claims were presented covering pretty comprehensively the details of construction of the device shown in the drawings, as follows:

1. The combination of the spindle B, the spindle-head C, the notch c, the set-screw F in a shuttle A, with a stationary pin, D, substantially as specified.
2. The head C of a shuttle-spindle, provided with a notch to receive the pivot-pin, as set forth.
3. A shuttle, A, provided with a set-screw, F, for adjusting the spindle, as set forth.
4. The anti-friction roller s inserted into the spring-bearing of a spindle-head of a weaving-shuttle, substantially as specified.

Rule 11 provides that "in case the applicant, by amendment, seeks to introduce any claim or claims not *substantially embraced in the original affidavit*, he will be required to file a supplemental oath," &c.

Applicants have filed an amended specification and claims, which are not accompanied by "a supplemental oath," and the Examiner, applying Rule 11, refuses to consider them on their merits unless so accompanied; whereupon this appeal is taken. The original affidavit "substantially embraced" the invention originally stated, described, and claimed as above quoted. Any modifications or limitations of a claim or claims justly within the scope of the statement of the invention sworn to, or of the claims made under that statement are, of course, allowable without being accompanied by a new oath. Within the scope of both the statement of the

invention and the claims, taken together, there is always the right of amendment in this manner. But the original claims, as a rule, constitute the inventor's true estimate of what is his invention, and are what he intends to substantiate as such by his affidavit, and there is only one case that occurs to my mind where an amendment, unaccompanied by an oath, could properly be allowed to be based alone upon the statement of the invention in the specification. Thus it is an essential rule of practice that the claims and statement of the invention must always be made to correspond before a patent can issue. But should a claim be originally submitted more limited in its terms than the sworn statement of the invention, and the particular description thereof, the requirement of correspondence between the claim and statement could be fulfilled at will by the applicant, either by making the claim broader, to conform to the statement, or the statement narrower, to conform to the claim. Neither of such amendments would require a supplemental oath. The question here is whether the amended claims are within what was originally stated and described as the applicants' invention. This is answered at once in the negative, by the fact that a portion of the subject-matter of the amended claims—viz., the pivot-pin extending only partially through the shuttle and secured by a plug—was neither shown in the original drawings, nor described or referred to in the original specification. The pivot-pin was only there referred to and shown as of ordinary construction, extending entirely through the shuttle, as the Examiner has stated. The present representation of the pin in the drawing was effected by amendment subsequent to the Examiner's adverse action. True, the construction now shown and claimed is to be found in the model, and, therefore, may properly form the basis of new claims to be made and sworn to; but it can in no sense be said to be "substantially embraced in the original affidavit." That affidavit referred solely to the original specification and claims, as illustrated by special reference to the drawing, which would go to constitute a part of the patent if granted. It had no reference to the model.

The amended claim seems also to contemplate and will probably involve an interference, wherein the rights of others will be concerned, and for this reason it is the more important that it should have the sanction of the applicants' oath before being entertained by the Office.

The importance of the oath accompanying an application for patent is not always appreciated. It is expressly required by act of Congress and required for a purpose. It is not a mere formal matter to be treated indifferently or disregarded. Its employment rests upon sound reason. The leading principle of our patent law is to secure the grant of patents for none but new inventions, and to none but the original and first inventors thereof. The oath of an applicant is the first step in accord with, and obedience to, this principle. It goes to assure the novelty and utility of the invention. Followed by a careful examination in the Patent Office, it gives *prima facie* validity to a patent, and supports the faith of the public in its legality, and such is the object of its requirement by the statute.

The Examiner is clearly right in his action, and his decision is affirmed.

LACROIX AND WELCH.—*Interference.*

[*Appeal from the Examiner of Interferences in the matter of the interference between the application of E. N. Lacroix for Letters Patent for* IMPROVEMENT IN MIDDLINGS-PURIFIERS, *and the patent of E. P. Welch, granted February 18 and reissued April 1, 1873.—Decided November 12, 1873.*]

Practice under Rule 61: *Held*, that, pending an interference between a patent and an application, upon a broad claim, a patent was properly granted the applicant upon a subsequent application with subordinate claims, covering special devices not in interference, which claims had been withdrawn from the interfering application.

The intent of a rule should govern its application. The second proviso of Rule 61 is properly complied with when the broad subject-matter in interference is disclaimed in a subsequent subordinate patent, and the reason therefor stated to be that it is the subject-matter of another application.

THACHER, *Acting Commissioner:*

The history of this case gives rise to questions somewhat complicated.

January 17, 1873, Welch applied for a patent, which was granted the 18th of the month following. March 17, 1873, he applied for a reissue of this patent, which was also granted, April 1, 1873. The first claim of this reissued patent was a new one and much broader in its scope than either of those allowed originally. February 21, 1873, only three days after the date of Welch's first patent, the papers in the application of Lacroix were filed; but it was not completed by the filing of the model, so as to go forward for examination, until the 30th of April following. Subsequent to the reissue of Welch's patent, and, before action had been taken on his application, Lacroix filed an amendment thereto, inserting an additional claim, which is a copy, almost verbatim, of the first claim of Welch's reissued patent, and, without doubt, was suggested by the grant of the latter. The amendment was accompanied by a request for an interference with Welch's patent, which was accordingly declared the following day, May 20, 1873, the subject-matter involved being limited by the Examiner to the broad claim in each case. May 28, 1873, under the provisions of Rule 61, Lacroix filed a second application, containing the claims of the first application not involved in the interference, these claims having been struck out from said first application by amendment. The new application resulted in the issue of a patent bearing date June 3, 1873, the interference, as originally declared, in the meantime continuing.

It is claimed by Welch that Rule 61 was violated in the issue of the patent to Lacroix, and that he should be compelled now to prosecute the claim in interference by reissue of said patent. He, therefore, moves for a dissolution of the interference, which has been granted by the Examiner of interferences. The appeal is taken from this decision.

The principal ground for the motion is that the devices patented by Lacroix are involved in the interference, and that this patent already granted to him could at any time be reissued with the same claims now in controversy.

Rule 61 is as follows:

When an application is adjudged to interfere with a part only of another pending application, the interfering parties will be permitted to see or obtain copies of so much only of the specifications as refers to the interfering claims. And either party may, if he so elect, withdraw from his application the claims adjudged not to interfere, and file a new application therefor: *Provided*, That the claims so withdrawn cover inventions which do not involve the devices in interference: *And provided*, also, That the devices in interference are eliminated from the new application. In such case the latter will be examined without reference to the interference from which it was withdrawn.

The application of any rule must be governed, to some extent, by its original intent. Rule 61 was designed to apply especially to an interference *between applications*, and for the purpose of preventing one party going out before the world with a patent, showing, perhaps, the subject-matter of a pending interference, and thereby leading the public to suppose that it was protected by said patent, to the great detriment, perhaps, of the other party contesting the claim. To some extent, the provisos also apply in interference between an application and patent; for a portion of the claims in an interfering application ought not to be allowed to go to patent under any circumstances, unless they are for separate inventions, so that, if the interference should result in the grant of another patent to the same party, the two will be distinct from each other; but, if, as in this case, one party already has a patent, the grant of a patent with a later date to the other party can work no damage to the first patentee, even though it show the subject-matter of the interference; especially if the second patent is subordinate to the one already in existence, which is acknowledged to be the fact in this case.

Now, it is admitted on the part of Welch, that the claims in the patent granted to Lacroix involve devices not to be found in his patent; and although the device now declared to be in interference is claimed in combination with other devices which are shown in said patent, it is admitted that he, Welch, could not possibly make these claims by reissue. So far, then, the two patents are distinct from each other; but the drawings, descriptions, and model are the same in Lacroix's patent and the interfering application, and it is, therefore, insisted that the claims withdrawn must necessarily involve the devices in interference. But it will be observed that the claim in controversy is a broad one and not limited to special devices. It, therefore, cannot be restricted to the special devices shown by Lacroix with any more right than to the devices shown by Welch, which are in some particulars different. Where the claim in interference is broader in scope than the special devices shown by any of the parties, the subject-matter involved cannot be limited to just what is shown by either of said parties. I do not see, therefore, that the first proviso of Rule 61 was violated by the issue of a patent to Lacroix.

The inquiry remains whether the second proviso was complied with. The specification of the patent contains this disclaimer, "I do not claim, broadly, the use of the auxiliary blast, as the same is the subject-matter of a separate application." This appears to be as definite a compliance with the proviso as could be required. The subject-matter of the interference is distinctly disclaimed and the reason therefor stated—to wit, that it is the subject-matter of another application. Now this would be an estoppel to the grant of any claim to the subject-matter of the interference in an application for reissue of this patent; and the applicant would find himself rejected on reference to his own prior application now in interference.

It will also be observed that, if the pending application of Lacroix should result in the issue of a patent, it could not be reissued with claims to the special devices already patented, for he would be rejected on the patent of June 3, to which the record would direct any one seeking information. If this interference should thus result, however, to make certainty doubly sure, it might be well to require a disclaimer of said patented devices (with the statement that they constitute the subject-matter of another application) in the present application, before allowing it to go to issue.

It appears clear to me that the patent already granted and the application now pending, are distinct from each other; that the provisos of Rule 61 have been fully complied with; that the action taken in the grant of the patent to Lacroix was regular and proper; and, therefore, that the interference ought not to be dissolved.

The decision of the Examiner of Interferences is overruled, and the proceedings in the present interference will be continued.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

[*In equity.—Before Shepley, Circuit Judge.—Decided October 28, 1873.*]

JAMES B. FORSYTH *vs.* CHARLES M. CLAPP *et al.*

If a tube has been formerly prepared from fibrous material and india-rubber in a certain manner, and cut into rings for stuffing-boxes, to use similar tubes upon shafts for the rolls in a wringing-machine does not entitle any one to monopolize them as his invention.

But he may have a patent for the combination of a tube thus constructed with the shaft, although united in the same way that tubes and shafts have been before united for the same purpose, provided new results have been thereby effected.

A roll for a wringer consisting of fibrous material, of which the fibers are looped about a wire wound tightly around the shaft, and stand out from the shaft in a radial direction, the whole being embedded in india-rubber, which is thereby attached to the shaft, is not an infringement of a patent for a similar roll, in which the fibers also stand out radially, but in curved directions, and are attached to the shaft only by means of the rubber in which they are embedded.

The inventor who has first discovered the advantages of employing upon wringers a well-known roll formed of fibrous material embedded in india-rubber, in which the fibers stand out in radial directions, and has reduced it to practice in one form, is not for that reason entitled to monopolize all rolls fabricated of such materials, in which the fibers stand out radially, however they may be attached, or though constructed in a different way.

Although his claim may be expressed in terms so broad as to cover all such rolls with radial fibers, the court will look into the specification and restrict the claim to what is there shown; and if the patent be a reissued one they will also look into the original specification for the same purpose.

[*William Whiting* and *James E. Maynadier*, for complainant. *Benjamin R. Curtis* and *George L. Roberts*, for defendants.]

SHEPLEY, *J.:*

Without at this time stating the conclusions to which the court arrived in relation to several questions presented in this case, it will be sufficient for the disposition of the cause to state the decision of the court upon the question of infringement. For a proper consideration of this question, it is necessary to consider the state of the art at the time of the alleged invention of Forsyth.

Rubber rolls for wringers were first made in the form

of tubes or hollow cylinders, and expanded onto a plain shaft. Then attempts were made to secure the roll more firmly to the shaft, first by winding the shaft with wire and afterward with twine. An effort was made to secure a more lasting union to the shaft by forcing the tube upon a heated shaft. Next followed a mode of making the shaft itself of two or more parallel rods. The rubber rolls first made with a number of holes corresponding to the number of rods were forced onto these rods which were then connected at their extremities. Canvas was also interposed between the shaft and the roll and cemented to both. Various other devices appear to have been resorted to for the purpose of fastening more firmly the tube to the shaft. The purpose of all of these inventions was to make a more perfect connection of the elastic roll with the metallic shaft.

The difficulty which Forsyth thought he saw, and which he claimed had not been obviated by any of the other devices, was not so much the separation of the roll from the shaft, at the lines or points of connection, as the tendency of the strain on the rolls when in use to a destruction of the body of the roll itself. His theory was, that while the connection of the shaft with the homogeneous body of the roll constricted on to the shaft, was sufficient for all practical purposes in the use of a wringing-machine, that the real difficulty to be overcome was, that the particles of rubber in contact with the shaft separate and tear away from the rest of the rubber composing the body of the roll. He acted upon the hypothesis that, while the various connections of the roll with the shaft were sufficient to withstand the strain, a portion of the body of the roll would break away from the portion retaining its connection with the shaft by a process of disruption or rending asunder of the body of the roll itself. He commenced, thereupon, a series of experiments, the object of which was to substitute for the homogeneous rolls in use a roll with a tougher, stronger, and less elastic substance in the interior than in the exterior portion of the roll. After trying various methods to accomplish this result by the addition of fibrous or other non-elastic material to the stock of which the interior of the roll was composed, he finally constructed a roll with fibrous material arranged in the interior portion of the tubular roll in a manner which, in an expression proximately descriptive, he calls radially. A sheet of cloth, with a thin layer of vulcanizable compound on each side of it, is first cut into long stripe, "bias" or diagonally across the threads or fibers of the cloth. Several of these long strips are placed upon each other and pressed together until the surfaces of rubber or vulcanizable compound are cemented and permanently united. The sheet thus formed is cut into strips or bands of suitable width to admit of their being easily wound on a mandrel, or the shaft of a roll, in such a manner that the fibers of the cloth will radiate from the mandrel or shaft. As shown by the drawing accompanying his specification, it is obvious that each thread would thus extend from the interior to the exterior of the fibrous portion of the roll in a curved radial line, the threads crossing each other, and such threads being nearer together at the core or axis, and separated further from each other as the distance from the core or axis increases. The roll is then made up to the desired size by winding rubber sheets around it coated with cement, when it is placed in molds and subjected to the vulcanizing process, the rubber in its soft and plastic state filling up all the crevices around and between the layers and incorporating the parts together. In this way it is claimed that "*the tenacity of the roll and the degree of adhesion of the parts are much increased*, and the position of the fiber is better adapted to resist any tendency of the roll to become loose and turn on its shaft when subjected to a strain."

Charles McBurney had invented and manufactured at the works of the Boston Belting Company a tube substantially, if not precisely, like the tube of Forsyth. No appreciable material distinction can be discovered between the modes of making the McBurney and the Forsyth tube, or in the tubes themselves when made on a mandrel. McBurney's tubes and their mode of manufacture are represented by exhibits ten to fourteen, inclusive. These tubes were made of all sizes, from three-quarters of an inch to several inches interior diameter, and from one-half inch to an inch and a half thickness of tubing, and sold in tubes to consumers. The purchasers cut them in sections or rings for stuffing-boxes. Such a tube constricted onto a shaft would be Forsyth's roll. Forsyth does not describe any particular mode of connecting the tube with the shaft. He leaves that to be effected by any of the old and well-known processes in use. All that can with any show of reason be claimed for his roll is the combination of an old tube with an old shaft in a mode which was old to accomplish a new and useful result.

Treating it as a valid patent for this new combination of an old shaft with an old tube by old means of connection, for the purpose of considering the question of infringement in the light of the state of the art as existing when he made his roll, we now proceed to examine the construction of the Moulton roll as actually made and relied upon as an infringing device.

The Moulton roll, as manufactured by the respondents, was made by applying transversely to a sheet, or between two sheets of vulcanized rubber, a layer or range of strands of fibrous material and cutting this sheet into ribbons of the desired width at right angles to the length of the strands. These ribbons are folded in the center, and a metallic wire is inclosed in the fold and wound spirally about the shaft, under great torsion, from end to end between the journals, the wire being fastened to the shaft at each extremity. A cylinder or sleeve of rubber is applied over the surface, and the whole is subjected to a vulcanizing process until the whole mass of the roll is thoroughly compacted together. The wire is so tightly wound under pressure that it, in fact, becomes a part of the shaft. The fibrous threads are, in fact, loops which pass into one orifice and out of another in the metallic shaft, their ends extending strictly radially into the body of the roll.

There is a radical and obvious difference in the function of the fibers in the two rolls. Their similarity consists in the fact that the fibers in one are arranged in curved radial diverging lines, extending in a direction toward the periphery of the roll, and in the other in radial lines extending in the same direction. In both of them the effect of the fibers is more or less to diminish the elasticity of the interior portion of the resilient roll; but in the Moulton roll, as made by the respondents, not to any material or scarcely appreciable extent. Their difference consists in the function which they perform. The inner ends of the fibers in the Forsyth tube touch or nearly touch the shaft. They do not fasten the rubber compound to the shaft, or aid in fastening it. The ends of the fibers themselves are not fastened to the shaft except so far as they are cemented by the vulcanizable material. The vulcanizable material holds the ends of the fibers up to the shaft instead of the fibers performing that function for the vulcanizable compound. The inner ends of the fibers in the Forsyth roll were attached to the rigid portion of the roll resting upon the shaft, and the outer ends extended from this rigid portion toward the circumference of the roll, thus tending to secure that "adhesion of the parts" of the roll to each other, at which he aimed, as well as to limit the mobility of the rubber into which they extend. If McBurney's tube, or Forsyth's, be constricted upon a shaft which is too small, or in sufficiently cemented or connected to the shaft by any of the then existing modes of connection in an imperfect manner, so that the shaft turns in the tube, that result would not be owing to the fact that the fibers of Forsyth failed to perform perfectly their function of confining the rigid portion of the roll to the more elastic portion of it, and of limiting the mobility of the rubber in which they are buried. So, when the roll is subjected to strain by the passage of the sliver of cloth between the rolls of a wringer, causing the outer surface to be compressed in one place, and expanded in others, the fibers in the inner portion of the Forsyth roll do undoubtedly tend to prevent the body of the roll from being separated from the shaft; but they do not effect this result by reason of their attachment to the shaft preserving the connection between the shaft and the rubber, but by reason of their acting at the same time to preserve the form of the inner and more rigid portion of the tube, and keep up the adhesion of such parts with the outer portions where the mobility and resiliency is greater. But perfectly as the fibers may perform this function, a tube imperfectly cemented to the shaft may still, for that reason alone, turn on the shaft in the Forsyth roll. Now, the loops or bows in the the Moulton fibers enter the shaft, and the ends of the fibers extend like "staples" (which they resemble in form) into the body of the roll, for the purpose of securing the interior of the resilient body to the shaft. The fibrous loop is to be taken as a whole. The parts of the fibers which extend from the interior toward the exterior of the rubber roll would not operate to confine the rubber to the shaft without the loops. By none of the methods in use at the date of Forsyth's patent, of making the connection between the shaft and the rubber, was the connection made any more tenacious by presenting the ends of the fiber to the surface of the shaft. In some of them the presence of the ends of the fibers lessened the adhesion by as much as it displaced the rubber. The principal function of the fibers in the Forsyth tube, as before stated, is to make the inner portion of the tube more rigid, and to tie the more rigid to the more elastic portion of the tube. Now, in the Moulton roll, as manufactured by the respondents, the principal function of the fibrous loops is to tie the rubber to the shaft, and they do *not create any material rigidity* in the interior portion of the tube. The method of fastening in the Moulton roll is an inseparable part of the roll itself, being necessarily constructed and built up with the roll and constituting the inner portion of the roll. It is not adaptable to Forsyth's tube, nor is Forsyth's tube capable of having Moulton's fastening applied to it. Because Forsyth borrowed from McBurney his method of constructing the interior of a tube with fibers of *cloth* arranged in radial curves, it would be the height of injustice to allow him to monopolize any use of fibers for any purpose whatever in a wringer-roll, if the ends of the fibers extended in a radial direction into the body of the roll. His reissued patent, examined in the light of the invention described in the original patent, if valid, must be limited to such a mode of introducing the fibers of a *woven* texture radially into the tube for the purposes indicated, without regard to the mode of fastening to the shaft.

The Court will look beyond the mere form of words in the claim of a reissued patent into the specifications, in both the original and reissued patent; and even if, on the face of the reissued patent, it does not embrace anything not described or suggested in the original, nevertheless, the Court will ascertain whether there is any substantive invention adequate to support a claim ingeniously worded, not so much for the purpose of describing what the patentee really invented as of grasping within its terms some contrivance not within the knowledge or contemplation of the patentee, and for that reason, not by reason of inadvertence or mistake, not embraced in the claims of the original patent.

Comparing the two rolls, as we have done in some more essential particulars, and without recapitulating other points of difference, enough has already been stated to show, that, so radically different is the structure of the rolls, and the function of the fibrous material, and its mode of operation, that the Moulton roll, as manufactured by the respondents, is clearly no infringement upon anything secured to Forsyth by his reissued patent, even giving to the invention claimed in that patent the fullest scope claimed for it in the evidence of Forsyth himself and the expert testimony introduced by him.

Bill dismissed.

APPLICATIONS FOR EXTENSION.

Applications having been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,599.—Dedcating and Clarifying Cane-Juice.—Granted to RICHARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 3, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,475.—Breech-Loading Fire-Arms.—Granted to BETHEL BURTON, December 20, 1859, and reissued December 21, 1869. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,484.—Platform-Scales.—Granted to THADDEUS FAIRBANKS, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,486.—Pipe-Molding.—Granted to JOHN FENTH and JOHN INGHAM, December 20, 1859, and reissued April 28, 1863. Application filed September 13, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,487.—Screw-Taps.—Granted to WILLIAM and ROBERT FOSTER, December 20, 1859. Application filed September 18, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,506.—Water-Trap.—Granted to JAMES A. LOWE, December 20, 1859. Application filed September 19, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,512.—Nail-Plate Feeder.—Granted to JOHN NEWELL, December 20, 1859. Application filed September 16, 1873. Testimony closes November 18, 1873. Hearing December 3, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KIMBALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,582.—Harvesters.—Granted to JOHN GORE, December 27, 1859, and reissued January 15, 1861. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to JONATHAN P. GROSVENOR, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to SAMUEL LESHO, December 27, 1859. Application filed September 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Porous Ware.—Granted to BRADFORD S. PIERCE and MASON B. PIERCE, December 27, 1859. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to BENJAMIN F. STURTEVANT, December 27, 1859. Application filed September 25, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,674.—Clothes-Driers.—Granted to B. B. HAWES, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to FRANCIS C. LOWTHROP, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,808.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 30, 1869. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,822.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,869.—Machines for the Manufacture of Tinware, granted to SAMUEL J. OLMSTED, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 28, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,906.—Stitcher.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROBERT O. MELDRUM and AMOS B. PARSON, January 24, 1860. Application filed October 28, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860, and reissued August 1, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,942.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,952.—Lamps, granted to GEORGE NELSON, January 24, 1860. Application filed October 18, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOMINSKY, January 31, 1860, and reissued March 26, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,023.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTTER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,043.—Lock for Umbrella-Stands.—Granted to ALFRED M. FOOTE, February 7, 1860. Application filed November 8, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,094.—Machine for Making Cartridge-Cases.—Granted to ETHAN ALLEN, February 14, 1860, and reissued May 9, 1865, in two divisions, numbered, respectively, 1,948 and 1,949. Application filed November 11, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,135.—Sugar-Cutters.—Granted to CHARLES KINZLER and WILHELM ROSEBROCK, February 14, 1860. Application filed November 13, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,139.—Hanging Rudders.—Granted to JOSEPH P. MANTON and HENRY A. BILLINGS, February 14, 1860. Application filed November 10, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,179.—Marking-Gages for Sewing-Machines.—Granted to CALVIN D. WHEELER, February 14, 1860. Application filed November 14, 1873. Testimony closes January 13 1874. Hearing January 28, 1874.

27,185.—Soldering-Irons.—Granted to ABNER BURBANK, February 4, 1860. Application filed November 8, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,241.—Photographic Cameras.—Granted to AUGUST SEMMENDINGER, February 21, 1860. Application filed November 20, 1873. Testimony closes January 20, 1874. Hearing February 4, 1874.

27,291.—Seed-Planters.—Granted to JOHN S. HUGGINS, February 28, 1860. Application filed November 24, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 28, 1860; and reissued August 4, 1868. Application filed October 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,406.—Cultivators.—Granted to ROBERT CRAIG, March 6, 1860. Application filed November 22, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOWT, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

30,467.—Apparatus for Slinging Pigs.—Granted to ABRAHAM and EDWARD M. DENNY, October 23, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,202.—Fare-Boxes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

EXTENSIONS GRANTED.

26,177.—Improvement in Making Rubber Belting, granted to DENNIS C. GATELY, November 22, 1859.

Claim.—A new article of manufacture, machine belting or banding, manufactured with surfaces of india-rubber or gutta-percha, and having surfaces which are as nearly as is practically possible perfectly smooth, as described.

26,178.—Improvement in Rubber Belting, granted to DENNIS C. GATELY, November 22, 1859.

Claim.—The method above described for manufactering machine belts or bands of india-rubber or gutta-percha, by rolling them in thin sheets of flexible metal, and then heating them, substantially in the manner and for the purposes above described.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date November 18, 1873.]

6,996.—Lock-Case.—WILLIAM H. ANDREWS, New Haven, Conn., assignor to MALLORY, WHEELER & Co., same place. Application filed November 11, 1873. Term of patent 7 years.

6,997.—Carriage-Wheel Hubs.—JOSEPH R. LOCKE, Amesbury, Mass. Application filed August 27, 1873. Term of patent 7 years.

6,998.—Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed November 6, 1873. Term of patent 3½ years.

6,999.—Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed November 6, 1873. Term of patent 3½ years.

7,000.—Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed November 6, 1873. Term of patent 3½ years.

7,001.—Oil-Cloth.—CHARLES T. MEYER and VICTOR E. MEYER, Bergen, N. J., assignors to EDWARD C. SAMPSON, New York, N. Y. Application filed November 6, 1873. Term of patent 3½ years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date November 18, 1873.]

1,527.—Ice-Pitchers.—ADAMS, HALLOCK & Co., Brooklyn, N. Y. Application filed July 18, 1873.

"'Pure Silver Lined.'" "'Cryptochylon.'"

1,528.—Soap-Powders.—BENJAMIN T. BABBITT, New York, N. Y. Application filed June 25, 1873.

"a five-pointed star, with the words 'Soft Soap-Powder.'"

1,529.—Baking-Powder.—BENJAMIN T. BABBITT, New York, N. Y. Application filed June 25, 1873.

"a five-pointed star."

1,530.—Compound Spice for Seasoning Meats, &c.—E. R. DURKEE & Co., New York, N. Y. Application filed November 7, 1873.

"'SALPICANT.'"

1,531.—Medicine.—WILLIAM H. GREGG & Co., Elmira, N. Y. Application filed December 20, 1872.

"'Vallex.'"

1,532.—Kid-Gloves.—FORTUNÉ HEGLE, New York, N. Y. Application filed November 7, 1873.

"'Fortuné.'"

1,533.—Cutlery.—ISAAC T. MEYER & Co., New York, N. Y. Application filed September 9, 1873.

"'Our Own.'"

1,534.—Gold and Silver Solutions for Electroplating Without a Battery.—ARTHUR B. MORRISON, Portland, Me. Application filed October 9, 1873.

"'A-B-M.'"

1,535.—Agricultural Implements.—L. M. RUMSEY & Co., St. Louis, Mo. Application filed October 31, 1873.

"'Golden Crown,' and a crown printed in gold."

1,536.—Driers, Paints, Varnishes, &c.—GEBA C. LEBKA, Williamsburg, N. Y. Application filed November 8, 1873.

"'Terebine,' a lion and eagle."

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date November 18, 1873.]

ORIGINAL PATENTS.

144,590.—Corn-Husking Machine.—L. AUGUSTUS ABRAHAMS, Albany, N. Y. Application filed December 23, 1870.

Improvement on patent No. 101,809, April 12, 1870. Spiral depressions in the husking-rollers receive the husk, which is then nipped off.

Claim.—1. The husking-rollers *c c*, when provided with spiral depressions *c* upon their peripheries, and formed as described, substantially as and for the purposes set forth.

2. In a machine for husking corn, the picking and feeding rollers *b c*, formed with flattened surfaces or depressions, as shown, and without ribs or cutting-edges of any kind, that as the stalk is passed between said rollers the ear shall be suddenly removed by the impinging of the eccentric surfaces of said rollers upon the same, in the manner substantially as described.

3. In combination with husking-rollers arranged to operate substantially as described, the trough *g*, when constructed as shown, and made removable endwise from the machine, as and for the purposes specified.

144,591.—Hay-Knife.—JOHN S. BALL, Mishawaka, Ind. Application filed April 18, 1873.

A semicircular yoke is constructed upon the lower part of the handle, and to this yoke the knife-blade is riveted. The blade can be removed and renewed when broken or worn out.

Claim.—The combination, with the blade A, constructed as described, of the handle B and yoke C, the latter being in curved form, corresponding with the shape of the blade, united to the handle and riveted to the blade, as and for the purposes herein set forth.

144,592.—Preserving Fruit and Vegetables for Food. WILLIAM G. BARBER, High Point, N. C. Application filed September 20, 1873.

Claim.—1. The treatment of fruit and other food by drying and partial saturation with sugar, substantially as and for the purposes herein specified.

2. The treatment of green corn by separating the milk and pulp from the hulls and drying, as herein specified.

144,593.—Numerical Filing-Case.—GEORGE W. BETTSWORTH, Cedar Rapids, Iowa. Application filed June 13, 1873.

Claim.—The numerical filing-case consisting of the compartments formed by the sloping partitions C, the rubber holding-band F, and file-wire D, as described and shown, and for the purpose set forth.

144,594.—Sportsman's Cartridge-Holding Vest.—JOSEPH H. BLACK, Columbia, Pa. Application filed August 13, 1873.

Claim.—The several series of the fluted open-bottomed pockets P, with the bottom lodge L made upon one or both sides of an ordinary vest or waistcoat, substantially in the manner and for the purpose mentioned.

144,595.—Fire-Extinguisher.—GEORGE BOOTH, Toronto, Canada. Application filed September 1, 1873.

The bottle has a flange on the bottom, by which it is suspended in an inverted position. Its mouth is closed by a convex cap of soft metal. A revolving spindle, having a hooked point to tear the soft-metal cap, extends through the side of the alkali-reservoir.

Claim.—1. The inverted pot A, having the convex cap E, in combination with the spindle H, capable only of the revolving or rocking movement described, and having the hook-shaped point G, substantially as set forth.

2. The combination of the seat C, cap D, and flange *c* on the bottle, as and for the purpose set forth.

144,596.—Vegetable-Slicer.—NATHAN BOSFORD, Lockport, N. Y. Application filed August 21, 1873.

Vegetables are sliced by means of a "plane," the cutting-iron of which is seated diagonally, and held by means of slots and projections and a clamping-screw, so that it can be adjusted, removed, and replaced with facility.

Claim.—The cutting-blade A, having the hooks C D and end *b*, with its curved slot B, in combination with the rectangular frame having the loops E F, and carrying the bolt or screw, all constructed and operating substantially as and for the purpose specified.

144,597.—Attaching Knobs to Drawers, &c.—SAMUEL A. BRACKETT, Boston, Mass. Application filed October 9, 1873.

A screw with its end flattened is passed through from the inside of the drawer into the shank of the knob. A small screw is passed through the knob-shank at right angles to the first one, and, by resting against its flattened end, prevents it from being turned in using the knob.

Claim.—The combination of the flattened screw A with the knob B and screw c or its equivalent, arranged substantially as and for the purposes hereinbefore set forth.

144,598.—Stud and Button.—FRANK E. BROWN, Pawtucket, R. I. Application filed March 24, 1873.

The stud or button has a hook-shaped shank, curved so that when it is attached it forms a double spring. The center of the spring portion of the device is flattened and slotted to receive the end of the shank.

Claim.—1. A hook-shaped fastening for studs and buttons, containing the double spring formed by the parts C and *f*, substantially as and for the purposes described.

2. The part D, provided with the slot G, into which the end of the shank may clasp, constructed in the manner and used for the purposes substantially as set forth.

144,599.—Picture-Frame.—JOHN A. BURCH, Buffalo, N. Y. Application filed August 25, 1873.

Claim.—A corner-piece for picture, advertising, and analogous frames, made substantially as described, in one piece of cast-iron or other metal, and provided with letters or other devices in relief, as and for the purposes set forth.

144,600.—Car-Spring.—ERASTUS T. BUSSELL, Indianapolis, Ind. Application filed April 25, 1873.

Claim.—1. A volute spring, elliptical in form, the central portions of the long sides of the several coils of which are closely in contact, constructed to operate substantially as and for the purpose specified.

2. The combination of the spring A and the set-screw S with an elastic substance between the point of the screw and the spring, as and for the purpose specified.

144,601.—Spindle for Spinning-Machines.—WILLIAM T. CARROLL, Woonsocket, R. I., assignor to SIMEON S. COOK, same place. Application filed September 8, 1873.

The auxiliary spindle is separate from the main one, and rotates in the stem of the bolster to lessen friction.

Claim.—The auxiliary spindle *a''*, operating in the socket or stem *f* on the seat *n*, and forming a seat or bearing for the base *b* of the spindle *a*, substantially as specified.

144,602.—Fluid Compound for Embalming Human Bodies.—WILLIAM E. CHENOWETH, Baltimore county, Md. Application filed June 2, 1873.

Gum-camphor, two ounces; pulverized aloes, one and a half ounce; sulphate of potasea, four ounces; balsamodendron myrrh, two ounces; pulverized saltpeter, four ounces; arsenic, six ounces; carbolic acid, two ounces; bromide of potasea, six ounces; acorus calamus, one and a half ounce; hydrochloric acid, or muriatic-zine acid, two pounds. These are well compounded and mixed, and to it is added from one and a half to three gallons of high rectified spirits of wine.

Claim.—The chemical compound mixed with the fluid as described, used and operated as shown, and for the purposes set forth.

144,603.—Tilting Chair.—JOHN ENGER, Portland, Me. Application filed May 2, 1873.

The seat, arms, and back frame of the chair are attached together and to an inner frame under the seat. To the sides of this inner frame are attached cetips bearing studs that work in slots in the pieces attached to the leg-frame. A spiral spring is attached to the under side of the seat, and to a cross-bar of the leg-frame, to draw back the seat when tipped. A slotted slide is attached to the under side of the frame, and engages with a catch on the under side of the seat.

Claim.—1. The combination of the horizontal frame A, legs B, seat C, curved parts E F, slots I I', pieces G H G' H', studs J J', and spiral spring K, substantially in the manner herein set forth.

2. In combination with the tipping seat C, the slotted slide M and catch N, arranged as herein set forth.

144,604.—Sheet-Metal Coffin.—JOHN D. FARRINGTON, Jr., New York, N. Y., and THEODORE P. AUSTIN, Portland, Conn. Application filed February 7, 1873.

The upper and lower dishing portions of the coffin are each swaged up from a single piece of metal. A central portion is then riveted by its flanges to the two portions first named. A clip extends around the entire coffin-covering, and concealing the uniting flanges and rivets.

Claim.—1. The upper and lower swaged-up pieces M N, with the removable extension-piece O clamped thereto by means of the screws D *d* or equivalent fastening device, as and for the purposes set forth.

2. In combination with the above, the lips E, passing entirely around the coffin and covering the flanged cape, as above described and set forth.

144,605.—Ingot-Mold for Gold or Silver.—JOHN FEIX, San Francisco, Cal. Application filed June 16, 1873.

Claim.—1. In combination with a mold for producing ingots of gold or silver, a recess or cavity formed in the mold above the ingot-shaping chamber to compensate for contraction and expansion of the ingot and secure a uniform density, substantially as described, for the purpose specified.

2. In combination with a mold for casting ingots of gold or silver, a channel or groove, J, arranged in respect to the mouth of the mold substantially as and for the purpose specified.

3. The section B, having the walls *a b c*, incline *d*, and base D, in combination with the enlarged chamber H, section F, and a suitable clamping device, substantially as and for the purpose specified.

144,606.—Hatter's Head-Measure.—FRANK A. FENTON, Camden, N. J. Application filed December 11, 1872.

A flexible band, with an exterior measuring-scale for its overlapping end, is compressed by an elastic cord, and is held at any required size by a clamp-screw. A series of segmental flaps, bent outward at right angles from the lower edge of the measuring-band, forms a semblance of a brim.

Claim.—1. The combination of the yielding shell A, the sliding guide *d*, the set-screw C, the engraved scale K, and the elastic cord *m*, arranged and operating as herein described.

2. The arrangement of the yielding shell A, made of a continuous strip of thin flexible material, in combination with the brim B, rigidly secured to it, but capable of expanding in size with the shell, substantially as herein described.

3. The combination of the yielding shell A with a suitable sliding guide to retain the two ends in contact, the scale A, the elastic cord *m*, and the expanding brim B.

144,607.—Cotton-Seed Planter.—DANIEL P. FERGUSON, Jonesborough, Ga. Application filed October 7, 1873.

A seed-box is mounted upon a frame, which is supported by a furrow-opener and seed-coverer. A transverse shaft with stirring-arms is placed within the hopper. The shaft carries a crank at each end, one pointing upward and the other downward. From the extremity of each crank proceeds a strap, to the right and left fore leg of the animal, respectively, which, in walking, give motion to the seed-agitator. Curved plates cut the weeds, and also cover the seed.

Claim.—1. In combination with the hopper *a* and stirrer *d*, having the cranks *g g* extending in opposite directions from the shaft C, the draft-straps A A, as specified.

2. The plates *n*, having the sharpened edges *m* and the inwardly-projecting ends *t*, substantially as shown.

144,608.—Dumping-Wagon.—WILLIAM FIELDS, Wilmington, Del. Application filed August 20, 1873.

Claim.—1. The combination of the body *c*, hinged gate 4, small door 6, and curved sides 8, substantially as set forth.

2. The closed chute 9, in combination with the endless apron having buckets for carrying the coal across the sidewalk, substantially as set forth.

144,609.—Under-Garment.—OLIVIA P. FLYNT, Boston, Mass. Application filed August 4, 1873.

A combined chemise, under-skirt, and corset-cover, having attachments for suspending other under clothing.

Claim.—1. The under-garment consisting of the waist *c* and skirt *w*, and with long or short sleeves and high or low neck, constructed substantially as described, and intended to take the place of the ordinary chemise, corset-cover or waist, and under-skirt.

2. The garment above described, when made with high neck and long sleeves, and arranged for attaching ruffling, lace, cuffs, &c., by means of the buttons *d*, *e*, or *g*, as specified.

3. The arrangement, with the said garment, when made with short sleeves and low neck, of the band A, substantially as and for the purpose above set forth.

4. The arrangement, with the said garment, when made with short sleeves and low neck, of the band A and pendent pieces *h*, substantially as and for the purposes before set forth.

5. The arrangement, with the garment above described, when made with long sleeves and high neck, of the pendent pieces *m*, substantially as and for the purposes hereinbefore specified.

144,610.—Narrow-Ware Loom.—RUFUS B. FOWLER, Worcester, Mass. Application filed August 19, 1873.

The shuttle is reciprocated on a curved race by rising and falling pins, which alternately take into holes in lugs on the shuttle-plate, and work in vertical cylinders on a vibrating radial arm, being actuated by annular plates with suitable inclines. The stop mechanism, or an alarm-bell, is connected with the weft-detecting fingers by the wires from a galvanic battery, so that when the weft fails the loom is either automatically stopped or the operator is notified.

Claim.—1. The stationary curved race, the curved shuttle, constructed and applied to the race as described, the spindle P, the radial vibrating arm Q', with its cylinders S S and pins R R, and the pin-actuating annular plates *b b*, all arranged, constructed, and operating as set forth.

2. The spindle P, the radial arm Q', with its cylinders S S and pins R R, and the pin-actuating annular plates *b b*, all arranged, constructed, and operating in the manner described, in combination with a stationary curved shuttle-race and curved shuttle, substantially as described, and for the purposes set forth.

3. The combination of the fingers W W', wire A, and curved shuttle-race, constructed, arranged, and operating in the manner described, and for the purposes set forth.

4. The shuttle T, wire A, fingers W and W', and lifting-bars X and X', when combined, arranged, connected, and operating substantially as set forth, and for the purposes specified.

144,611.—Collar and Cuff.—EDWARD P. FURLONG, Springfield, Mass. Application filed October 2, 1873.

Curved folds are made in collars, cuffs, &c., to give a flare to them.

Claim.—The combination of two or more folds in collars, cuffs, and other similar articles of wearing-apparel, arranged in opposite directions, as herein described and shown, whereby the article is given the desired shape and strength, as set forth.

144,612.—Carriage-Top.—JAMES N. GILL, Oshkosh, Wis. Application filed August 21, 1873.

Claim.—The combination of the spring and clasps B and the bow A, substantially as and for the purpose set forth.

144,613.—Harness-Saddle.—ALGERNON GILLIAM, Pittsburg, Pa. Application filed May 20, 1873.

Securing a leather welt between the seat and back plate, which welt allows the leather covering to be stitched through around its entire surface, and, being pliable, prevents the covering from being worn off by abrasion.

Claim.—1. The leather or welt A, clamped and secured between the seat B and the back plate or cantle C, in the manner and for the purpose herein described.

2. The within-described means of securing the leather upon the seat and back of the saddle (and covering the same) by the combination of the covering *a a'* with the leather or welt A, seat B, and back plate or cantle C, for the purposes herein set forth.

144,614.—Mustache-Shield for Drinking-Cups.—JOHN J. GREENOUGH, Syracuse, N. Y. Application filed April 21, 1873.

A strainer is combined with the mustache-guard, which is attached to the cup by two pairs of elastic fingers, which embrace the outside and inside of the cup.

Claim.—1. The spring-hooks A, of the mustache-shield, for holding the same securely within and below the rim of a drinking-vessel, substantially as herein described.

2. The combination of the strainer with a mustache-shield, substantially as and for the purposes set forth.

144,615.—Match-Safe.—JULIUS HELM and ALPHONSE HELM, Washington, D. C. Application filed September 17, 1873.

An opening in the top of the box has such length and width that only one match can be taken from the safe at one time. This opening has an enlargement on each side of its center for admission of the fingers of the hand, and also one at each end, to permit the passage of the friction-ends of the matches without their ignition.

Claim.—The central longitudinal slot F F in the box-top, having rigid sides, and combined with the recesses G G for the thumb and finger, and with enlargements *f*, to permit the passage of the match-tips without friction, all as herein shown and described.

144,616.—Hot-Air Register.—WILLIAM HIGHTON, Malden, Mass. Application filed October 21, 1873.

The wheel is outside of the register-grate. Its axis is extended through the grate, and to it is pivoted the end of the radial lever that, by means of projections, operates the slide which moves the slats.

Claim.—1. The lever D, pivoted to the plate E, and provided on its under side with one or more projections, *r*, in combination with the slide C, having one or more notches, *g*, operating substantially as described, and for the purpose set forth.

2. The wheel H, pivoted to the grate G and attached to the lever D, which actuates the shutters, the end of said lever moving in the arc of a circle having its center at the point where the wheel is pivoted, substantially as and for the purpose described.

144,617.—Skirt-Protector.—JAMES JENKINSON, Brooklyn, E. D., N. Y. Application filed November 4, 1873.

The skirt-facing is provided with one or more welts made of leather or other tough material, which welts keep the train up off of the ground.

Claim.—As a new article of manufacture, a skirt-protector, consisting of a body, A, of suitable material, provided on one side with protruding guards made of leather, rubber, or like durable material, so arranged that when applied to a dress-skirt or trail said guards will be interposed between it and the ground or sidewalk, substantially as and for the purpose specified.

144,618.—Hub-Boring Machine.—FREDERICK JONAS, Burlington, Iowa, assignor to himself and GEORGE O. RAY, same place. Application filed August 31, 1872.

For centering the two ends of the hub and boring the same at one operation without removing the cutting-tool.

Claim.—1. The cutter *t'*, carried by the sleeve *t*, and arranged for operation substantially as and for the purpose specified.

2. The shaft *e* and sleeve *t*, with their respective cutters, operating in combination substantially as and for the purpose specified.

3. The combination of the hinged yoke *m' m''*, collar *n*, and adjustable slide *t*, substantially as and for the purpose specified.

4. The combination of the shaft *e* and sleeve *t* with the collar *n*, slide *t*, clamp *m*, and the nut *n*, when constructed and operated in manner substantially as and for the purpose set forth.

5. The cam-latch *x*, attached to the slide *t*, for holding back the sleeve *t*, as set forth.

144,619.—Sealing Dip-Pipe of Gas-Works.—EDWARD JONES, Boston, Mass. Application filed October 20, 1873.

A pendent wall, upon one side of which is the dip-pipe, divides the main into two chambers. When it is desired to seal the dip-pipe communication is opened, by means of a pipe, with a point beyond the exhauster, so as to create pressure and cause the liquid to rise in the chamber containing the dip-pipe.

Claim.—In combination with the hydraulic main *a*, pressure-chamber *d*, connecting-pipe *f*, one or more, and the valve or cut-off A, leading from any part of the gas apparatus beyond the exhauster, where the pressure is about two and a half inches of water, and the valve *i*, leading to any part of the gas apparatus where the pressure is zero, or nearly so, as herein set forth.

144,620.—Rod for Drawing in Warp-Threads.—MARY S. JORDAN, Tilton, N. H. Application filed May 13, 1873.

To hold the warp-threads in position when drawing them into the harness they are passed between two clamping-rods, one rabbeted and fitting into a corresponding groove in the other, the two being held together by clasps at the ends.

Claim.—The rods *a b*, constructed as above described, with their respective clasps, clamps, or their equivalent, as and for the purposes above set forth.

144,621.—Apparatus for Purifying and Filtering Oils.—DANIEL M. LAMB, Strathroy, Canada. Application filed November 10, 1873.

Claim.—The series of two or more movable pans, A A', with conical bottoms, containing a filling of cotton and charcoal, and resting one on another within a jacketed casing, B, all as herein shown and described, for the purposes set forth.

144,622.—Compound Vulcanizable Gum.—DANIEL M. LAMB, Strathroy, Canada. Application filed November 10, 1873.

Claim.—The compound vulcanizable gum herein described, consisting of caoutchouc with the inspissated juice of milk-weed.

144,623.—Treating Vulcanizable Gums and Caoutchouc.—DANIEL M. LAMB, Strathroy, Canada. Application filed November 10, 1873.

Claim.—The mode or process herein described for the combined treatment of vulcanizable gum and petroleum, or any product thereof, by dissolving the gum in the oil, and subsequently distilling the solution, as and for the purposes set forth.

144,624.—Car-Coupling.—ANTOINE LANGELLIER, Concord, N. H. Application filed June 6, 1873.

The concussion caused by the meeting of the draw-heads forces them back so that the catch which sustains the pin is thrown out of engagement with that on the car, and the pin is allowed to fall.

Claim.—The car-coupling composed of the draw-bar *c*, the pin *b*, the frame *e*, the bar *d*, and catches *f* and *g*, adjusted and combined to operate as and for the purposes set forth.

144,625.—Protecting Buildings against Fire.—WILLIAM MCALLISTER, Lawrence, Mass. Application filed August 27, 1873.

The water is elevated to the roof-ridge through a stand-pipe connecting with a perforated conduit, whence it is ejected against a deflector provided with longitudinal gutters. It flows from the gutters in sheets over the roof, thus forming a protection against sparks from burning buildings in the vicinity. The eaves-gutter is hinged so as to be capable of being tilted, to throw the sheet of water which descends from the roof against the wall.

Claim.—1. The deflector-plate D and the two gutters *b b*; arranged together, and with the roof *a* and conduit, in manner and to operate as described.

2. The gutter B, applied to the roof so as to be capable of being turned from a horizontal into an inclined position, or vice versa, as and for the object as explained.

144,626.—Wood-Joining.—REUBEN MCCHESNEY, Ilion, N. Y. Application filed September 4, 1871.

Claim.—The method of joining various woods or pieces of wood together, in representation of "marquestry" or inlaid work, by means of dovetails cut, by appropriate mechanism, through the pieces to be joined at one operation, and in bevel form, so as to form tight joints when united, substantially in the manner herein described and shown, for the purposes set forth.

144,627.—Clothes-Wringer.—THOMAS E. MCDONALD, New Brunswick, N. J. Application filed July 10, 1873.

To the four posts two rollers are journaled in a diagonal position, one to the other, and held by screw-bolts. Clamp-screws are attached to two of the posts.

Claim.—The combination of the posts A, ties A', screw-bolts B B', having clamp-arms B' and *b'*, with the wringer-rollers C and C', substantially as described.

144,628.—Chimney-Tool for Glass-Blowers.—James G. Mustin, Pittsburg, Pa. Application filed February 19, 1873.

Claim.—A new article of manufacture, viz., a chimney-tool for glass-blowers, said tool consisting of the spring A and detachable blades B, constructed substantially as herein described, and for the purpose set forth.

144,629.—Cotton-Harvester.—William H. Pedrick, Richmond, Ind. Application filed March 27, 1873.

A horizontal cylinder, having teeth of different lengths, the longer being placed nearest the ends, is mounted on wheels and drawn over the plants to be picked.

Claim.—The cylinder of a cotton-picker provided with teeth arranged in pairs, the teeth of each outer pair being longer than those of the pair or pairs within it, substantially as described.

144,630.—Process of Repairing Spinning-Rings.—Horatio L. Peirce, Taunton, Mass. Application filed October 15, 1873.

Claim.—The method described of repairing spinning-rings, by annealing them until soft, and then widening out the flange by means of blows or pressure, so as to form a perfect flange, substantially as specified.

144,631.—Rolling-Mill.—Charles H. Perkins, Providence, R. I.—Case B. Application filed June 24, 1873.

A relief-guide, D, situated between the twisting-guide B and box-guide C, constructed with its side walls pivoted and held in position by springs, and the top held down by a weight. The object is to allow the walls of the guide to give should the metal crowd, and resume their position when the metal is withdrawn. A pair of large rolls, A^2 A^2, one carrying a knife, cuts the bar into lengths as it passes out.

Claim.—1. The relief-guide D, constructed with side walls *b b*, made yielding to internal pressure, substantially in the manner described.

2. In combination with any two consecutive sets of rolls, A A^1, in a rolling-mill, a relief-guide, D, substantially as described.

3. The combination of two consecutive sets of rolls, A A^1, twisting-guides B, relief-guide D, and box-guide C, substantially as described.

4. The means of securing a roll to its shaft, which consists in the combination of the tongued cap K K F with the shaft E and roll A_1, respectively grooved and recessed, substantially as described.

5. In combination with a rolling-mill, as described, the revolving grooved wheel A^2, the knife H, and revolving bed A^2, substantially as described.

144,632.—Guide for Rolling-Mills.—Charles H. Perkins, Providence, R. I.—Case A. Application filed June 24, 1873.

To facilitate the adjustment of the guide, which is divided longitudinally, springs are interposed that press the sides against the clamping-bolts. In order to reduce the friction on the bar when passing through the guide the lower part of the chamber is made somewhat broader than the upper.

Claim.—1. A box-guide for a rolling-mill having an inwardly-projecting guiding-surface on each side thereof, both of which guiding-surfaces are practically in the same plane, and extend longitudinally therein, substantially as and for the purposes specified.

2. The combination, with the rolls A A′, of the box-guide B, which is provided with inwardly-projecting guiding-surfaces, substantially as and for the purposes specified.

3. In combination with the box-guide for rolling-mills the springs D D, substantially as described, for the purposes specified.

144,633.—Guide for Rolling-Mills.—Charles H. Perkins, Providence, R. I.—Case C. Application filed June 24, 1873.

Two arms, D D′, pivoted to a cross-bar, are operated to close two guide-bars pivoted to the table at their outer ends by a wedge, *c*, formed on the end of bell-crank lever, one end of which projects over the rolls and is raised and retained in position by the rod passing between the rolls, which bears against its end.

Claim.—1. In combination with the rolls A A′ of a rolling-mill, the compress-guide B B′, the tongs D D′, and wedge *c*, substantially as described.

2. The combination of the compress-guide B B′, the tongs D D′, the wedge *c*, and its operating-lever E E, so arranged that a bar passing through the guide will, by contact with the wedge operating lever, compress the rod within the guide, substantially as described.

144,634.—Stove-Pipe Damper.—Josiah M. Read, Boston, Mass. Application filed July 30, 1873.

The spindle is held in position in the receiving-socket of a damper by transverse projections or ridges on the face of the sockets or flanges. These projections or tension-bars are placed as far apart as practicable to utilize the elasticity of the spindle.

Claim.—1. In a stove-pipe damper, substantially as described, the socketed disk B, formed with two or more bridges or tension-bars to operate with the spindle, in manner and for the purpose set forth.

2. The above-described stove-pipe damper, the same consisting of the disk B, having angular sockets provided with transverse tension-bars *d*, the rectangular spindle S, and the frictional spring C, arranged upon the spindle, as specified, the whole to be applied to a stove-pipe, in the manner and for the purpose stated.

144,635.—Machinery for Making Barrels.—Charles Ruggles, Huron, Ohio. Application filed June 3, 1873.

The machine cuts the cross and chamfers the end upon a continuous strip of wood, which is afterward bent into a circular form, and makes the body of a barrel.

Claim.—1. In combination with the cutter-wheels C, the pulley-shafts D, adjustable bearings E, and slide-bars F, substantially as set forth and shown.

2. The combination of geared feed-roller G, the friction-rollers H, and weighted levers I, substantially as and for the purposes set forth and shown.

3. The combination of feeding-roller G, cam K, and cutter-bar J, substantially as shown and described.

4. The combination, in a single machine, of the chamfering, crozing, feeding, and dividing devices, substantially as set forth and described.

144,636.—Writing-Desk, &c.—Daniel Schafer, Parkersburg, W. Va. Application filed September 8, 1873.

The upper front drawer is fastened by a side drawer, which enters the back part thereof and operates as a bolt. The tier of side drawers are fastened by means of a sliding upright, which can be moved back only when the front door of the desk is opened. The door can be opened when the straight side of the tripping-lever is brought parallel with the door-jamb, when the locking-bolt can be moved. An indicator is placed on the door to determine when the lever is brought into the proper position to release the bolt.

Claim.—1. The combination of the end drawer B with the front drawer C, operating as a bolt to secure the latter, substantially as set forth.

2. The sliding upright *c*, arranged to work in grooves *w*, and provided with a flange, *v*, in combination with the side drawers *d*, for operation as specified.

3. A piece of furniture constructed with the end drawer B, front drawer C, and side drawers *d*, in combination with the sliding upright *c*, perpendicular drop-bolt *b*, revolving tripping-lever *a*, and sliding swinging door D, whereby the several compartments are secured, substantially as shown and described.

144,637.—Spark Arrester and Conductor.—Eleazer Shoemaker, Melmore, Ohio. Application filed September 8, 1873.

Claim.—The inverted cone C, provided with the short cylindrical flange D, and applied upon the vertically-adjustable rod G, in combination with the smoke-stack A, provided with the cylindrical head B, conical directing-surfaces *a a′*, perforated surface *b*, extension *x x*, and discharge-pipe P, all substantially in the manner and for the purpose described.

144,638.—Revolving Hammer.—George Stacy, Nanuet, N. Y. Application filed June 26, 1873.

A rotating shaft having three (more or less) radial arms, to the outer end of each of which is pivoted the handle of a hammer, each hammer being connected by a sliding pin to the next succeeding arm, which connection limits the throw of the hammer.

Claim.—The rotating shaft A, the arm C, the hammer D, and stop E, all combined and arranged as shown and described.

144,639.—Mode of Fastening Cutters in Stone-Cutters and Other Tools.—George Stacy, Nanuet, N. Y. Application filed June 21, 1873.

The slot in the stock into which the cutting-tool is secured is made with one side either flat or beveled and its opposite side convex. A wedge having one flat side and the other convex is inserted between the cutting-tool and stock.

Claim.—The cavity D, formed in one side of the recess that receives the cutter or similar tool to be fastened, and made in the shape of a segment of a hollow cylinder, and a key, E, correspondingly shaped upon one side and flat upon its other side, substantially as herein shown and described.

144,640.—Stone-Cutter.—George Stacy, Nanuet, N. Y. Application filed May 24, 1873.

The cutter-stocks are hinged to the shaft, and their movement from the center of the same is limited by an adjustable stop. The bed carrying the stone is automatically moved beneath the cutters. A vertical shaft carrying cutters is arranged in such relation to the horizontal shaft that both the side and end of the stone may be dressed at the same time.

Claim.—1. The combination of the cutting-tool J with a cutter-stock, F, hinged to the cylinder E, and by its connection with a stop, H, made to operate substantially as specified.

2. The combination of the cylinder E and its cutter-stocks F, and the intermittent and changeable feeding mechanism described, consisting of the disk-wheel P, with its changeable pins W, driven by the gear O, the lever V, the adjustable stop Y, the pawl U, and the ratchet-wheel T, substantially as specified.

3. The combination of the vertical cylinder E^2 and the horizontal cylinder E, each with its revolving cutter-stocks F, whereby a stone may be dressed upon its upper side and on a side or end at right angles thereto at the same time, as specified.

144,641.—Portable Fence.—Byron L. Taylor, Marlin, Tex. Application filed April 18, 1873.

The pickets alternately have their lower ends behind and their upper ends before the stringers, and the reverse, a wire above the upper stringer and below the lower serving to bind the pickets by taking the side opposite to the stringers. The panels have looping connections, which render the fence flexible in all directions.

Claim.—The combination of the pickets *a*, the stringers *c*, bracing-wires *i*, and flexible loops *e*, substantially as shown and described.

144,642.—Combined Door-Securer and Key-Ring.—Jeremiah P. Tuck, Houlton, Me. Application filed February 27, 1873.

A single piece of steel is formed into a straight round shank, with two outwardly-projecting spurs at one end, while the other or free end, gradually diminishing in thickness, is bent into a loop-spring or ring, thus serving both as a portable door-securer and an ordinary key-ring combined together.

Claim.—As an article of manufacture, the implement described, constructed of a single piece of steel, consisting of the stem A with spurs B C and the loop D, gradually diminishing in thickness and forming a spring at its free end, as shown, and for the purposes set forth.

144,643.—Telegraph Apparatus for Automatic Signaling.—William Unger, Newark, N. J., and Hamilton E. Towle, New York, N. Y. Application filed August 15, 1873.

District alarm-telegraph signal-box, in which a reciprocating circuit-breaker is used, attached to a stem. Depression of a stem winds or compresses a spring, furnishing power for return movement. Circuit-breaker depressed is held by a detent released manually or by the closing of a circuit through an electro-magnet placed in a local circuit for the purpose of automatically giving signals for fire or burglars.

Claim.—1. In telegraph apparatus for automatic signaling, the combination of a reciprocating circuit-breaker with a detent to hold and release the movable reciprocating part of the breaker, and a spring or weight to move the same, for the purpose of giving signals, substantially as described.

2. In telegraph-machines for automatic signaling, the combination of two or more reciprocating circuit-breakers with a switch-key, by which any one of the circuit breakers may be brought into action independently of the other, substantially as described.

3. The stem or key, for the double purpose of setting the circuit-breaking apparatus and of testing the line-current which operates the automatic telegraphic machine, substantially in the manner described.

4. The electro-magnet, arranged substantially as described, for the double purpose of testing the current which operates the machine and for unlocking the detent which holds the circuit-breaker whenever the circuit of a local battery is affected by the opening of a window or door or by heat.

5. The switch or conductor, connected to one end of the main circuit, upon which a point connected and moving with the circuit-breaker slides while the circuit-breaker is being restored to its starting-point, and which is insulated from contact with the circuit-breaker while the instrument is making signals, for the purpose of maintaining continuity through the main line while the movable part of the circuit-breaker is being restored to its starting-point, substantially as described.

144,644.—Steaming and Drying Apparatus for Shaping Pantaloons.—Ellen B. Viets, Boston, Mass. Application filed September 22, 1873.

The pantaloons are placed upon a stretcher or former, and then put into the steam-chamber. When they are to be dried the hot air is admitted into the drying-chamber.

Claim.—1. The combination of the steam-generator A and the steaming and drying chambers C E, constructed, arranged, and applied together substantially as set forth.

2. The combination of a former, F, constructed substantially as described, and the steaming and drying chambers C E, substantially as and for the purpose set forth.

3. The combination of the former F, the steaming and drying chambers C E, and the steam-generator A, all being arranged and applied together substantially in manner and for the purpose as specified.

144,645.—Vegetable-Cutter.—John R. Wharry, Moundsville, W. Va. Application filed October 7, 1873.

The cutting-knife is stationary, while the bed-pieces are pivoted at their outer ends, and adjusted at their inner ends by eccentrics to regulate the thickness of cut. The box in which the vegetables are placed is reciprocated by hand, which at the same time presses down the vegetables.

Claim.—The frame *a*, box *c*, follower *i l o n*, pivoted bottom pieces *e*, knife *d*, and cams *g*, the parts being arranged and combined to operate substantially as shown and described.

144,646.—Soda-Water Draft-Tube.—Otto Zwietusch, Milwaukee, Wis. Application filed May 5, 1873.

The main valve is operated by a stem inclosing a second valve-stem provided to operate the valve governing the lesser orifice, said valve having its seat within the main valve, thus permitting of the opening or closing separately of either the main or lesser exit-pipe, or of their united action.

Claim.—The valve *n*, having its seat over the opening *o* in the valve D, and having a positive motion from the screw *g*, in combination with the valve D and screw *c*, so that I am enabled either to open or close the viaducts *o p* singly or both together, as set forth.

144,647.—Loom-Temple.—Nicholas L. Allen and Edward S. Stimpson, Milford, Mass. Application filed June 9, 1873.

The temple is provided with two rollers, revolving, independently of each other, on a common shaft or on separate shafts, and of the same or different diameters, so arranged that their peripheries are not in the same plane, by which means, in combination with a shoulder on the trough, the cloth is crimped and held so that it cannot be drawn out laterally. The inner end of the roller-shaft has a flanged screw-head which fits the interior of the cap and tends to support it. The outer end piece, into which the roller-shaft is screwed, is slotted, and a clamp-screw so placed as to hold the shaft in position.

Claim.—1. A temple provided with two cylindrical independent rollers, A A′, the peripheries of which are in different planes, in combination with the trough C, adapted to such rollers, and having a shoulder, substantially as and for the purposes set forth.

2. In a temple, the combination of shaft B with the supporting-piece H, the latter having a slot, E, and clamp-screw F.

3. The pin or roller-shaft of a temple, provided with a screw-head and semicircular flange, *b′*, rigidly affixed thereto, for the purposes and substantially as shown and described.

144,648.—Combined Picture Frame and Exhibiter.—Benjamin Antan, Fitchville, Ohio. Application filed October 18, 1873.

Claim.—As a new article of manufacture, a combined picture frame and exhibiter, for the exhibition of a series of pictures, consisting of the combination of frame A, brackets B B′, picture-rollers C C′, guide-rollers E, and strip D, on which a series of pictures is mounted, all arranged substantially as and for the purpose described.

144,649.—Hemmer for Sewing-Machines.—William Lee Apthorp, Tallahassee, Fla. Application filed September 27, 1873.

The adjustable scroll allows for turning hems of any desired width, and the edge-turning scroll is supported at the ends of a wire frame, which also serves to guide the adjustable scroll.

Claim.—The scroll A, formed as described, adjustable scroll B, the frame C F G, and attaching-plate I, combined, constructed, and arranged substantially as specified.

144,650.—Heating Apparatus.—William C. Baker, New York, N. Y. Application filed July 3, 1873.

Water flows through the radiator, and can be admitted or shut off at will without interrupting the circulation in the main pipe.

Claim.—A radiator for circulating hot water connected to the primary circulating-pipe by two independent pipes, one at the upper part of such primary circulating-pipe, and the other at a lower level, in combination, with a cock to regulate or stop the secondary circulation in the radiator, substantially as set forth.

144,651.—Toy Gymnast.—Frederick A. Bancker, New York, N. Y. Application filed September 27, 1873.

Claim.—The gymnast A, having pivoted legs and arms, the former with end hook on each foot, and the latter attached to cross-cords B B, in combination with the tubes D and pivoted bars C C, as and for the purpose described.

144,652.—Method of Burning Brick.—Tobias Billesbach, Kearney Junction, Neb. Application filed August 16, 1873.

Fine coal is placed between the layers of brick, and the draft and heat are regulated by plastering the outside of the kiln in successive portions, from the bottom upward, as the burning progresses.

Claim.—The method of burning layers of bricks in a kiln by plastering up successive portions of the sides of the kiln, beginning at the bottom, and continuing it at intervals toward the top as the burning advances, substantially in the manner and for the purpose specified.

144,653.—Plow.—Elijah Bourne, New Iberia, La. Application filed April 17, 1873.

The plow-beam is composed of a plank, to the under side of which is attached a turn-plow, in rear of which are two subsoil-plows, the last subsoil-plow penetrating the earth a little deeper than the first. The forward end of the beam is regulated, as to depth of furrow, by a sliding gage operated from the handles.

Claim.—1. The clevis F, rods H, I, and J, and cross-bars h, *i*, and *j*, in combination with the plank A, frame *e*, thumb-screw G, and plows C, D, and E, substantially as and for the purpose hereinbefore set forth.

2. The movable foot-rest M, having a shoe, *r*, on the lower end, in combination with the plank A, frame *e*, chains *o* and *p*, arms N and O with slot S, slide Q, and pins *t* and T, substantially as and for the purposes hereinbefore set forth.

144,654.—Dumping-Car.—Levi C. Brady, Chambersville, Pa. Application filed March 17, 1873.

Claim.—The lever *i*, attached to the rear end of a dumping-car, one end of the lever being bent to lock the body of the car, and the other projecting beyond its side, the whole adapted for hand or automatic operation, substantially as set forth.

144,655.—Fastener for Meeting Rails of Sashes.—Edward Burstow, Horsham, England. Application filed October 10, 1873.

A hinged piece falls over the space between the two parts of the fastener whenever the lever is turned in proper fastening position. This prevents the passage of a knife from the outside for the purpose of turning back the lever and freeing the window.

Claim.—The hinged plate D, combined, as described, with a sash-fastener to turn down over the opening between the sashes whenever they are locked.

144,656.—Paint-Mill.—RICHARD BYRNE, Brooklyn, assignor to himself and JOSEPH J. MARRIN, New York, N. Y. Application filed June 13, 1873.

Vibrating levers support and hold in position the stationary revolving crushing-rollers above a revolving bed, and permit them to have a vertical play.

Claim.—In a grinding-mill of the kind described, the combination, with the stationary revolving rollers *d*, of the supporting and vibrating arms *c*, pivoted to a suitable frame by bearings *f*, substantially as and for the purpose set forth.

144,657.—Loom-Shuttle.—NATHAN D. CHAPMAN, Rollingsford, N. H., assignor to himself and HORATIO H. WARREN, same place. Application filed November 1, 1873.

To hold the cop securely in place upon the spindle as the shuttle is picked, the spindle is split, and the two parts twisted near the point.

Claim.—A split shuttle-spindle having a twist of a half of a turn or thereabout, near the point for binding the cop, in the manner described.

144,658.—Car-Coupling.—WILLIAM A. COCHRAN, Flat Rock, Ind., assignor to himself and JAMES T. BURCH, same place. Application filed August 4, 1873.

The block D is intended to hold the pin in an upright position, can be changed from one draw-head to another, and is notched at one corner, that it may hold the link in position to enter the opposing draw-head.

Claim.—A draw-head provided with a pin, B, and having mortise E and recess G, in combination with the changeable block D, substantially as and for the purpose described.

144,659.—Game-Table.—ROBERT R. CRAWFORD, Wytheville, Va. Application filed September 6, 1873.

Claim.—An improved game-table formed of the table A B, platforms C, provided with numbered spots at their forward end, the alleys D, receiver E, flanges F, conductor-passage H, and recess I, constructed as described, and arranged to operate, in connection with the pins G and balls J, substantially as herein set forth.

144,660.—Apparatus for Burning Hydrocarbons.—CHARLES H. CUMMING, Tidioute, Pa. Application filed September 20, 1873.

A disk-shaped pan, into which the liquid fuel is fed, is provided with an annular ridge in the center. As the fuel passes over the inner ridge it is caught by the blast admitted through a central orifice, and distributed in the form of spray of combustion.

Claim.—The vessel A, having outer and inner vertical flanges *a b*, the former higher than the latter, and each inclosing separate spaces, through which are respectively forced the liquid fuel and the air or steam, as and for the purpose described.

144,661.—Hypodermic Syringe.—EPHRAIM CUTTER, Woburn, Mass. Application filed October 29, 1873.

The piston is hollow, and connected at its end with a small cannula for perforating the skin. This cannula-point can be unscrewed and inverted within the piston-rod when not in use. A metal cap screws over the open end of the metallic barrel and closes up the entire apparatus, for carrying in the pocket.

Claim.—1. A hypodermic syringe composed of the barrel A, piston B, and tubular piston-rod C, carrying a hollow probe or needle, F, all combined, substantially as described, for the purpose set forth.

2. In combination with the barrel A and probe F, the covering-cap I, applied as shown, for the purpose specified.

144,662.—Butter-Worker.—DANIEL W. DAKE, Beloit, Wis. Application filed June 9, 1873.

Improvement on the patent to the same inventor, No. 134,788, of 1873, in which the wire cloth is substituted by thin blades, which are set in a removable frame beneath the hopper, their edges receiving and separating the butter, when it falls into a vat.

Claim.—The combination and arrangement of the hopper A, presser B, crank C, frame E, and knives F F, in connection with a vat to receive the butter pressed from the hopper, substantially as and for the purposes specified.

144,663.—Pipe-Joint.—JOHN DEMARREST, Mott Haven, N. Y., assignor to himself and JORDAN L. MOTT, same place. Application filed September 20, 1873.

The pipes have corresponding enlargements at their ends, with two annular recesses forming chambers to receive an extension of the inner pipe, and also form a close chamber for the packing.

Claim.—The pipes A E, having corresponding end enlargements, with two annular recesses to form chambers B C, the former to receive extension G, and the latter to form a close chamber for the packing, in the manner set forth, so that the packing will not be exposed to the water or acid, and thus gradually be forced out of its place into the pipe.

144,664.—Spring for Chairs, &c.—WILLIAM T. DOREMUS, New York, N. Y. Application filed August 30, 1873.

A slotted rocking plate is interposed between two rubber blocks having a central standard passing through them, and confined by upper and lower plates, held in position by a suitable nut working on the standard below the lower plate.

Claim.—The combination of slotted rocking plate C, center piece D, elastic blocks H H, and plates G I, as and for the purpose described.

144,665.—Glove.—THOMAS G. FOSTER, Gloversville, N. Y. Application filed October 18, 1873.

The inside pieces of the fingers and thumb turn over at the ends to form re-enforcing pieces upon the back.

Claim.—As a new article of manufacture, a glove having the palm and finger pieces cut in a single piece, when the finger and thumb pieces are made to turn over at the ends, so as to be attached to the back, substantially as shown and described.

144,666.—Machine for Shooting Dough.—OAKLEY B. FULLER, Newark, N. J. Application filed September 13, 1873.

A reservoir has two curved cheeks, with an aperture in the bottom. Between the cheeks are two corrugated rollers turned by gearing and cranks. The aperture has an adjustable jaw.

Claim.—1. The combination of corrugated rollers and curved cheeks, in a machine for forcing dough, arranged and operated substantially as described.

2. The combination of corrugated rollers and curved cheeks, with a throat for forming a sheet of dough, whether the throat or aperture be adjustable or not.

144,667.—Shaving-Mug.—ANDREW J. FURR and WALTER C. KNAUS, Boonsborough, Mo. Application filed October 18, 1873.

A shaving-mug is provided with a lamp for heating the water. A detachable soap-dish covers the mug and rests in the water. The water passes through an opening into a cup on the outside of the mug, in which the brush may be dipped.

Claim.—The combination of the cylinder A, base B, detachable lamp C, cup D, side cup E, side chimney or fine F, and detachable soap-cup G with each other, substantially as herein shown and described.

144,668.—Cotton-Gin.—NICHOLAS W. GADDY, Nichols, S. C. Application filed August 16, 1873.

Auxiliary fingers applied to the ordinary bars, between which the saws revolve, the said auxiliaries being adapted for easy attachment and detachment, and for shifting toward the saws from time as they wear smooth, thus exposing new and sharp edges.

Claim.—The combination of the auxiliary bars, fingers F, and their fastening devices, with the ordinary bars C of the gin, as shown and described, whereby said auxiliary fingers are adapted to be adjusted and detached, as set forth.

144,669.—Hinge for Safe and Vault Doors.—HENRY GROSS, Cincinnati, Ohio, assignor to HALL'S SAFE AND LOCK COMPANY, same place. Application filed August 9, 1873.

One leaf of the hinge is provided with a concave lip or shoulder, against which an eccentric, journaled on the pintle, bears, and when moved by means of an arm or lever attached to it forces the door outward, thereby drawing the interlocking flanges and recesses of the door and jamb apart preparatory to turning the door on its hinges.

Claim.—1. A hinge consisting of the leaf B with its pintle D, and the leaf A provided with the slot K and lip J, in combination with the eccentric C, the said parts being constructed and arranged to operate substantially as described.

2. The lever E provided with the eccentric C, in combination with the lip J on the leaf A, the whole being constructed and arranged to operate as set forth.

144,670.—Permutation-Lock.—HENRY GROSS, Cincinnati, Ohio, assignor to HALL'S SAFE AND LOCK COMPANY, same place. Application filed August 11, 1873.

The bolt is provided with a spring-arm, so arranged that the movement of the bolt in closing the door will cause the spring-arm to throw the tumblers out of combination, and thus avoid the necessity of turning the dial for that purpose.

Claim.—1. A permutation-lock provided with the spring-bolt H, which is forced back by simply shutting the door, and arranged to operate upon the tumblers to throw them out of combination when the door is closed, the construction and combination being substantially such as is herein described.

2. The compound bolt H I with the springs N and P, and the spring-arm L provided with the arm *e*, and the guide or pin M, in combination with one or more rotating tumblers, the said parts being arranged to operate substantially as and for the purpose set forth.

3. The lever R, provided with the incline or cam *e*, in combination with the spring-bolt H, arranged to operate as set forth, whereby the fence is raised out of the notch in the tumblers by the movement of the part H, as described.

144,671.—Mangle.—ERNST GUNDLACH, Hackensack, N. J. Application filed September 20, 1873.

A heavy roller is pivoted eccentrically to standards so as to operate upon a lower roller, which is turned by a crank, while the heavy roller is carried down to bear upon it by a forked handle.

Claim.—The improved mangle for family and other use, consisting of pressure-roller C with eccentric frame E and lever F, and clothes roller D turned by crank G and placed on standards B, which are applied to table A, substantially as and for the purpose described.

144,672.—Button-Hole Stitching Attachment for Sewing-Machines.—CARL A. HANSEN and GEORGE HARLEY, Guelph, Canada. Application filed June 7, 1873.

The axle of the looping-hook is arranged to rise and fall in a slot of the plate. This hook catches the loop of shuttle-thread, and then, through the needle-arm and link, the loop is drawn up through the button-hole. The swinging plate has a cam-grooved passage about a pivoted tongue and a laterally-projecting arm provided with a pin that enters a slot in a rocking lever, and as the cam-plate is vibrated through a pin projecting from the needle-bar, and which enters the cam-groove, this rocking lever is caused to reciprocate the pusher, which engages the shuttle-thread brought up by the looping-hook and passes it under the path of the needle.

Claim.—1. The mechanism for operating the pusher, comprising the angle-plate K attached to the needle-bar, the stud-pin on the angle-bar, the swinging cam-plate C, tongue G, spring M, arm Q, and rock-lever T on the frame A, when constructed and combined substantially as specified.

2. The looping-hook stock arranged in the slot *y* of plate A, and provided with the trip holding-arm *c'* on the frame A, and connected, by the arm *c'* and link *b'*, with the angle-plate K on the needle-bar, substantially as specified.

3. The cam-plate C, provided with arm *c'*, bar *d'*, springs N, and projection P, for releasing the hook-stock X, in the manner described.

4. The combination, as set forth, of arm *f'* of the hook-stock with arm A of bar *d'*, for turning the hook.

144,673.—Inking Apparatus.—ISAAC HART, Cincinnati, Ohio. Application filed July 2, 1873.

The sides of the fountain are slit and bent in near the roller to form end or side scrapers for the same.

Claim.—In combination with the ink-roller G, the walls F, slit as at *f'*, and said wall, at one side of said slit, bent inward, as at *f'*, to form scrapers for the ends of said rollers G.

144,674.—Blackboard-Rubber.—PEMBERTON B. HORTON, San Francisco, Cal. Application filed June 21, 1872.

Claim.—As a new article of manufacture, a blackboard-rubber, having the rubbing surface composed of one or more thicknesses of felt, *c*, secured to a leather or other flexible backing, A, substantially as specified.

144,675.—Fire-Place.—WILLIAM HOYLAND, Newcastle, Pa. Application filed July 19, 1873.

Claim.—The top-grooved base A, flanged side plates B B, and face-plates E, combined, as described, to receive rotary basket-grate G, divided by a partition, J.

144,676.—Stove-Damper.—HOSEA H. HUNTLEY, Quincy, Ill., assignor to COMSTOCK, CASTLE & CO., same place. Application filed June 24, 1873.

The damper is operated by means of a horizontally-moving rod, to which is secured a slotted plate that embraces a pin projecting from the end of the damper.

Claim.—The rod working horizontally, and placed as shown, and provided with a slotted plate for operating a damper-door, substantially in the manner described and set forth.

144,677.—Postal Card.—HENRY M. JOHNSTON, New York, N. Y. Application filed May 16, 1873.

Enameled with glue and Kremnitz white and coated with sulphate of alumina, chloride of sodium, biborate of soda, chloride of ammonium, and water. The chemical action between these compounds and the deposit from a metallic pencil renders the writing indelible.

Claim.—A postal card covered with the compounds herein described, or their equivalents, so that a mark or writing with a metallic pencil will be permanently fixed, as set forth.

144,678.—Treating Paper and Card-Board to Fix Marks by Metallic Pencils.—HENRY M. JOHNSTON, New York, N. Y. Application filed May 16, 1873.

Two compositions are used, one of glue, Kremnitz white, and coloring matter; the other of sulphate of alumina, chloride of ammonium, chloride of sodium, and borax. The writing or mark is made by a pencil of lead and bismuth, or lead and antimony.

Claim.—1. The compounds herein described, or their chemical equivalents, for coating paper so as to fix upon it marks made by a metallic pencil, substantially as set forth.

2. The process herein described for treating paper, the same consisting in fixing upon its surface chemical compounds or mordants, so as to bring out and fix upon it metallic marks, substantially as set forth.

3. The new article of manufacture, paper having upon its surface a coating or mordant, substantially such as herein described.

144,679.—Excavator.—DANIEL JUDD, Hinsdale, N. Y. Application filed October 29, 1873.

An improvement upon Patent No. 56,229 of 1866, (July 10.) The depth of the cut is regulated by adjustable supporting-chains, the lower ends of which are attached to brackets, which also serve as stops to the scoop in its revolution and as rests for the ends of the levers *d*, by which the scoop is tilted. The frame which supports the scoop is strengthened by truss-rods and straining-posts.

Claim.—1. The combination of the excavator-scoops E with the beams A, under-braces D, stays D', and fulcrum-board *a*, substantially in the manner and for the purpose described.

2. The combination of the suspending and adjusting chains G, levers *d*, and scoop E, substantially as and for the purpose set forth.

3. The combination of the scoop E, levers *d*, chains G and *l*, and the windlass mechanism, arranged as described, all substantially as and for the purpose set forth.

4. The brackets F, constructed to serve as stops to the scoop in its rotation, in combination with the lever-latch *j* and stop *i*, substantially as and for the purpose described.

144,680.—Tap, Plug, and Faucet Connection.—JOHN F. KANE, San Francisco, Cal., assignor of one-half his right to SAMUEL GUTHRIE. Application filed July 2, 1873.

Claim.—The combination of the bushing C with an internal thread or screw, and the projection *d d* on the outer end pressing against the packing in the recessed lock-nut B, the hollow plug D with an external thread or screw working into the thread of the bushing, and the notched end to receive the forked end of the faucet with the perforations H H, the recessed lock-nut B, forming as it does a combined lock-nut and stuffing-box, to prevent leakage, and the forked-ended faucet A, substantially as described, and for the purposes herein set forth.

144,681.—Car-Brake.—MARTIN KARG, Albany, N. Y., assignor to himself and MICHAEL HABER, same place. Application filed January 10, 1871.

Claim.—1. The combination of the stop E, attached to the truck or car, with the arms *f f*, attached to the wheels C C', connecting the coiled spring D, substantially as and for the purpose set forth.

3. The combination of the stop E, secured to the truck or car, with the arms *f f*, attached to the wheels C C', containing the coiled spring D, axle B, and clutches *b b'* and *a a'*, when all are arranged substantially as and for the purpose set forth.

144,682.—Furnace for Evaporating Alkaline Solutions, &c.—MORRIS L. KEEN, Jersey City, N. J., assignor, by mesne assignments, to MARY E. KEEN, same place. Application filed March 15, 1873.

Intended more especially for the evaporation of waste alkaline liquors from paper manufacture. The revolving section is for concentrating very weak liquids, thence transferred to the upper section of the reverberatory, and finally to the intermediate or drying and calcining chamber.

Claim.—1. In combination with the reverberatory evaporating-furnace, constructed, arranged, and operating substantially as herein described, the water sole or hearth composed of two metallic bottoms, as and for the purpose described and represented.

2. The combination of the reverberatory or evaporating furnace with a water sole or hearth, having water retained and circulating in the space between two metallic bottoms, and the water and steam drum connected with said water-space, as and for the purpose described and represented.

3. In combination with the reverberatory or evaporating furnace, having a double-jacket evaporating-pan covering its top, the water and steam drum arranged to operate in connection therewith, as and for the purpose described and represented.

144,683.—Harvester-Rake.—EDWARD LIPPOLDT, Brighton, Ill. Application filed September 6, 1873.

The rake-arm is jointed near its outer end, and flexibly held in position by a wing and retaining-spring, whereby it is permitted to yield to any unusual obstruction.

Claim.—A rake-arm formed of two parts, H and I, connected together by the hinge J, and having a spring, M, and spring-bar K, and wing B, arranged substantially as and for the purposes described.

144,684.—Storm-Window Fastening.—ADONIRAM J. LOVEJOY, Augusta, Me., assignor of one-half his right to MARSHALL WHITMED, same place. Application filed April 26, 1873.

Metallic fastenings with sloping faces for the ready attachment and detachment of exterior or storm windows.

Claim.—The storm-window fastenings E and F, having the reciprocally-beveled bearing-faces *d*, substantially as specified.

144,685.—Machine for Disintegrating Fabrics.—MOSES MARSHALL, Lowell, Mass., assignor to himself and DAVID LANE, same place. Application filed July 19, 1873.

The material is fed on an endless carrier to the machine, through which it passes, and in its passage the long unbroken threads are untwisted and picked apart; finally conveyed away from machine in long loose fibers. The waste falls into chambers below the main cylinders, which open into a central receiving-chamber.

Claim.—1. The combination of the feeding-aprons B, one or more delivery-rollers, C, two main toothed cylinders, E E, their workers and strippers F F F F G G, grates I I I I, feed-rollers M N, receiving toothed rollers L L, and rotary brush O, all arranged and operated, or provided with operative mechanism, substantially as specified.

2. The three chambers H H P, arranged and communicating as described, in combination with the grates I, the two series of

workers and strippers F G, the main and auxiliary toothed cylinders E C L, the feed-rollers M N, and apron B, and the rotary brush O, all arranged and provided with operating mechanism, substantially as specified.

144,686.—Water-Gage for Boilers.—CHARLES G. MARTIN and BENAJAH M. MARTIN, New York, N. Y. Application filed August 12, 1873.

The steam-pipe of a water-gage has an annular tubular steam-way, which conducts the steam around the gage-tube to a valve at the front, and is all cast in one piece.

Claim.—The metallic connection for the glass tube, composed of the tubular socket *c*, tube *k*, body *l*, and projection *o* for the gland, all cast in one piece with an annular tubular steam-way, *m*, and the tubular socket *e*, in combination with the valve *n*, and the opening in the socket forming the seat for said valve, substantially as and for the purposes set forth.

144,687.—Overflow-Alarm.—THOMAS MAYES, Albany, N. Y. Application filed July 5, 1873.

A tilting pan with a counterbalancing-arm is fulcrumed near its edge. The drip from an overflowing vessel falling into the pan causes it to tilt, and the counterbalancing-arm, rising, releases an alarm.

Claim.—The tilting pan H, fulcrumed and projecting beneath a drip-spout, combined with the catch C, lever B, and alarm A, as and for the purpose described.

144,688.—Spring Bed-Bottom.—WILLIAM C. MCGILL, Cincinnati, Ohio. Application filed August 11, 1873.

Side pieces of a supporting frame are laterally connected near each end by a round wooden bar, around which are loosely bent the ends of flat parabolic springs that support slats attached to their upper ends.

Claim.—1. The supplemental slat E, attached permanently to, or capable of a longitudinal sliding movement upon, the main slat D, substantially as set forth, for the purposes specified.

2. In combination with the cylindrical cross-bars B, springs C, and slats D, the frames A, arranged to operate substantially as herein shown and described.

144,689.—Corset-Clasp.—JAMES P. MACLEAN, Brooklyn, N. Y. Application filed March 10, 1873.

The corset clasp is made of wire bent into a zigzag spring, the fastening hooks and loops being made all in one with the body of the clasp. A strip of additional wire is interwoven with the finer wire to strengthen it.

Claim.—1. The wire busk or clasp A A', provided with hooks and eyes 1 2 3 4, forming integral parts of the same, substantially as and for the purpose set forth.

2. In combination with the clasp, constructed substantially as described, the strengthening-strip *s*, arranged as set forth.

144,690.—Fire-Extinguishing Water-Pipe Attachment for Buildings.—THOMAS MILLER, New York, N. Y. Application filed May 24, 1873.

Claim.—The standing pipe of a fire-extinguishing attachment to buildings, provided with climbing-pins J, and thus made available for a fire-escape, substantially as specified.

144,691.—Seaming-Machine.—ALFRED S. MUNGER, Brooklyn, N. Y., assignor to EDWARD T. COVELL, New Bedford, Mass. Application filed August 16, 1873.

Claim.—1. In a machine for closing the seams of metallic cans by means of jaws closing on anvil-plates supporting the can, as described, compressing-jaws, pivoted and normally tilted with reference to the can, substantially as shown and specified, so that each jaw, in closing on the seam, shall first make contact at one of its ends with the can, and then, by the act of further closing, be tilted so as to bring the acting surface gradually and progressively in contact with the same, as set forth.

2. The pivoted stationary and reciprocating compressing-jaws, and the springs for tilting the same with reference to the can, in combination with the yielding or adjustable anvil-plates, substantially as shown and set forth.

144,692.—Valve.—CHARLES F. MURDOCK, Detroit, Mich. Application filed November 3, 1873.

The valve-carriage is provided with lips for the retention of the valve-plates. Said plates are forced to their seats by a brace consisting of two spherical projections fitting into corresponding sockets in the valve-plates, and provided with a lip and central aperture, into which the taper point of the valve-stem projects and passes.

Claim.—1. The carriage C, having lips *b b*, in combination with the plates B and D, constructed as described, and arranged to be operated within a valve-case, as herein set forth.

2. The plates B and D, in combination with the brace O, the parts being connected by the ball-and-socket joints, substantially as described.

3. The brace O, provided with the lip *o*, in combination with the taper point *f* of the stem E, the said parts being arranged to operate as herein described.

4. In a slide stop-valve, a circular valve-plate provided with ratchet-teeth, and a pawl arranged to engage therewith when the valve is moved, whereby the plate has imparted to it a rotary motion to prevent unequal wear, substantially as described.

144,693.—Machine for Nicking and Shaving Screw-Blanks.—EDWARD NUGENT and JOHN FANNING, Brooklyn, N. Y. Application filed October 29, 1873.

The carrying-disk Q, provided with longitudinal depressions, in which the blanks rest, is intermittently rotated to feed two blanks—one to a cutter for finishing the head, and the other to a nicking-saw. One end of the shaft on which the disk is situated is supported in a frame, L, that is oscillated by a cam, Q', on a sliding bar, F, to grip the blank to be nicked against a rest below.

Claim.—1. The combination of the oscillating frame L, sliding bar F, shaft N, carrier-disk Q, guide *q'*, and stationary rest *t*, operating substantially as described.

2. The intermittent rotary oscillating disk Q and guide *q'*, in combination with the rotary shaft A, carrying the jaws *h h*, operated by the sliding spindle *f*, and the cutter *k*, operating to shave the head of the blank, substantially as and for the purpose set forth.

3. The combination of the oscillating frame L, sliding bar F, shaft N, disk Q, guide *q'*, stationary rest *t*, with a nicking-saw, substantially as and for the purpose set forth.

4. The intermittently rotary oscillating disk Q and guide *q'*, in combination with the nicking-saw *d*, shaving-cutter *k*, and a chuck for revolving the blank, substantially as and for the purpose set forth.

5. The frame *f*, carrying the saw-shaft T', and oscillated on the revolving shaft X by means of the connecting-rod *w'*, rod *r'* on the shaft *n*, arm *n'*, and cam *r*, substantially as and for the purpose set forth.

144,694.—Draw-Bar in Draft-Equalizers for Wagons.—JAMES M. ORPUT, Malta, assignor of one-half his right to HENRY SAFFORD, South Grove, Ill. Application filed April 28, 1873.

Improvement in patent No. 132,725. The arms of the draw-bar are connected with the ends of the axle of the wagon by means of chains, to equalize the draft.

Claim.—1. The draw-bar A, having the arms A, slots *b*, and swell *d*, substantially as and for the purposes herein set forth.

2. The curved arms *e e*, formed on the rear end of the draw-bar A, in combination with the arms or T-head *f*, formed on the rear end of the hammer-strap D, as and for the purposes herein set forth.

144,695.—Clip for Wagon-Axle Skeins.—JAMES M. ORPUT, Malta, assignor of one-half his right to HENRY SAFFORD, South Grove, Ill. Application filed April 28, 1873.

Claim.—The clip consisting of the two equal-beveled pieces A A, forming a tapering band, and having straight ears B B, curved ears C C, and link D, adapted to be fastened by bolts *a b* on the thimble-skein of a wagon-axle, substantially as and for the purposes herein set forth.

144,696.—Distributer for Extinguishing Fires.—GILBERT J. ORR, New York, N. Y. Application filed November 1, 1873.

Compound reaction revolving nozzles are arranged to rotate around their own axes, and at the same time to revolve around the stand-pipe by connecting gear-wheels, thus scattering the water in all directions.

Claim.—1. A revolving nozzle connected to a stand-pipe, and acting to scatter the water in all directions by the compound curved path described by the movement of the nozzle, substantially as set forth.

2. Two pairs of reactionary nozzles connected to a supply-pipe and revolving around the same by the action of the connecting gear-wheels, substantially as set forth.

144,697.—Middlings-Purifier.—GEORGE PARKER, Poughkeepsie, N. Y. Application filed November 1, 1873.

Feeding-cone distributes middlings evenly on head of upper shaker. Light substances blown out at end of machine.

Claim.—The funnel B, feeding-cone C, two or more inclined shaking sieves, G M, one or more return-chutes, L, cams I, fan K, conveyer O, and separators Q R S, all combined and arranged in a middlings-purifier, substantially as specified.

144,698.—Tea-Kettle.—NATHANIEL PLYMPTON, Boston, Mass. Application filed June 12, 1873.

Claim.—1. In the tea-pot or water-kettle, as described, the stationary handle provided with a single cover-guard, F, arranged to project from it and over the cover, in manner and for the purpose as set forth, in combination with such cover, separate from and made so as to rest upon and extend into the body, as represented and described.

2. The stand provided with the circular segmental top and pivotal chord, as described, and with the hook bar, arranged as set forth, in combination with the base of the kettle notched to receive the pivotal chord, as shown and described.

144,699.—Method of Fastening Artificial Teeth.—GEORGE F. C. REESE, Brooklyn, E. D., N. Y., assignor of one-half his right to ROBERT R. SINCLAIR, New York city. Application filed September 19, 1873.

Soft-metal rivets are inserted through holes punched in the aluminum plate and then headed down. Upon these rivet-heads the teeth can be easily and firmly secured.

Claim.—The fusible metal rivets inserted and riveted in the base-plate to aid in fastening the teeth thereto, all as described.

144,700.—Stop-Cock.—LOUIS C. RODIER and FRANCIS G. BATES, Springfield, Mass. Application filed March 7, 1873.

Claim.—The valve E, arranged in a chamber transversely to the water-way, constructed and combined with a rack, F, and means for imparting a transverse movement to the valve, so that, in the movement of the valve, a combined transverse and rotary movement is imparted thereto, substantially as set forth.

144,701.—Hand Corn-Planter.—ELI ROGERS, Rochester, Ind. Application filed June 21, 1873.

The pivoted jaw of the planter is held closed by a spring, and is opened by means of a cam-shaped hook, which engages with a crank actuated, through a connecting-rod, by a hand-lever pivoted to the handle. The cap, having the jaws, is removably held to the lower end of the planter by spring-catches.

Claim.—1. The cam-hook P on the plate O, and the crank-shaft Q, combined, as described, with the hand mechanism, as and for the purpose described.

2. The springs M M, combined with cap L, to hold the latter detachably in position on the body of the planter, as specified.

144,702.—Safety-Pocket Attachment.—RICHARD L. RUSSELL, Brooklyn, N. Y., assignor to JOSEPH W. ROBBINS, same place. Application filed November 1, 1873.

The watch-chain passes through the notch in the plates, and the hook, actuated by the spring, closes over it, thereby preventing its withdrawal.

Claim.—The combination of one or more notched plates, A F, a hook, B, and a spring, C, said plates being arranged for fastening onto or within the lid of a pocket, and the said hook arranged to fasten a chain in the notch, all substantially as specified.

144,703.—Pantaloons-Stretcher.—JOHN D. RYAN, New York, N. Y. Application filed September 13, 1873.

The pantaloons are fixed at the rings, and then stretched by means of the screw.

Claim.—1. The pantaloons-stretcher, consisting of the rods A, provided with the open spring-ring C, adjustable rods D, sleeves E, and spring-catches F, the three-armed block B, the swiveled screw G, nut H, rod I, open spring-ring J, and curved adjustable brace-rod K, said parts being constructed and combined substantially as herein shown and described.

2. The detached open spring-rings L, in combination with the upper parts of the rods A of the pantaloons-stretcher, substantially as herein shown and described, and for the purpose set forth.

144,704.—Carriage-Top.—HENRY SAYLER, St. Paris, Ohio. Application filed October 21, 1873.

Claim.—The rod B, provided with the lever C, and having the braces E rigidly attached thereto, in combination with the shifting-rail A of a carriage top, all constructed to operate substantially as described.

144,705.—Clothes-Wringer.—JOHN SEAMAN, Groton, N. Y. Application filed May 17, 1873.

The journals of the upper roll, with boxes, hold in slots in the sides or frame by an elliptic spring attached to the cross-bar on top of the frame. Each journal has a gear-wheel, and on the alternate ends of each is a projecting pivoted gear meshing into a wheel with extended teeth.

Claim.—The combination, with rolls D E, of the gear-wheels H I J K, and crank L, when all are constructed and arranged substantially as and for the purpose described.

144,706.—Hemmer for Sewing-Machines.—LOUIS SEXAUER, Brooklyn, assignor to himself and JOHN B. CHRISTOFFEL, Brooklyn, E. D., N. Y. Application filed August 9, 1873.

The end of one plate rests on the presser-foot, and the other plate, carried by this first plate, is adjustable by means of the screw, so as to press the fabric passing between the edge of the presser-foot and the edge-gage.

Claim.—The plates M, N, and screw P, constructed, combined, and arranged in a hemmer, substantially as and for the purpose described.

144,707.—Plow.—WILLIAM T. SHIPP, CHARLES J. PETERSON, and ROBASON L. MCLURD, Brevard Station, N. C. Application filed September 13, 1873.

The foot of the plow is provided with a shoe, which protects the land-side and bottom. The shovel has one slotted arm rigidly secured to its back, arranged to slide up and down between the double standards, for vertical adjustment. It also rests upon a second detached arm adjustable in the standards.

Claim.—1. As an improvement in plows, the combination of beam A, standards B, which are adjustable by key *b*, land-side C, shoe F, and detachable share E, substantially as and for the purpose described.

2. In combination with standard-bars B and head C', the top support G, sliding adjustably between the bars and share E, fastened by wedges d^1 d^2, as described.

3. The top adjustable support G, having wider head with recess *e'*, and slotted arm d^2, as specified.

144,708.—Corn-Planter.—LEVI SIPE, Keeslestown, Va., assignor of one-half his right to GEORGE R. EASTHAM, same place. Application filed October 23, 1873.

A segment of a wheel, having teeth, is centrally pivoted, and a small wheel hung to supports in a recess of the segment. As the machine traverses the field the small "ground-wheel" strikes each furrow (previously marked) and gives the segment a turn, pushing back the seed-slides by a spur. Teeth upon the segment serve to complete the revolution by engaging with the ground, when the operation is repeated at the next and each succeeding furrow.

Claim.—1. The combination of the ground-wheel E and toothed half-wheel C, substantially as and for the purpose herein set forth.

2. In combination with the seed-slides and retraction spring, the wheel E, and toothed half-wheel C, as and for the purpose herein set forth.

144,709.—Seat for Vehicles.—URIAH C. SNYDER, Richmond township, Huron county, Ohio, assignor of one-half his right to JOSEPH H. BEELMAN, same place. Application filed October 4, 1873.

Claim.—1. The forked arms B, provided with friction-rollers *f*, in combination with slotted guide-plates *g*, substantially as described.

2. The slotted guide-plates *g* secured to the seat, and flanged for the purpose of receiving the T-ends of the sliding arms, substantially as described.

3. The combination, in a tilting spring-seat, of the springs *e*, sliding arms B, and slotted guide-plates *g*, substantially as described.

144,710.—Grain-Drier.—ASAHEL SOPER, New York, N. Y. Application filed October 20, 1873.

The grain is dried by steam or hot air, which is conducted through it in triangular pipes. The moist air is exhausted from the spaces underneath the pipes into an adjoining chamber.

Claim.—The combination, in a grain-drier, of a large number of triangular steam-pipes, B, constructed and arranged as described, with the exhaust-chambers C D and the apertures *g* through the walls *a b* immediately underneath the bases of the said steam-pipes, all constructed, arranged, and operating substantially as and for the purpose specified.

144,711.—Corn-Planter.—ANDREW SPRINGSTEEN, Oquawka, Ill. Application filed February 21, 1873.

The frame is supported upon one bearing-wheel and a revolving cutter. A seed-box is placed contiguous to the bearing-wheel and the feed-roller, and its sweep receives motion from a series of cams upon the wheel.

Claim.—1. The slide J, reciprocating over the upper side of feed-roll D, thus serving both as a stirrer and a cut-off, in the manner set forth.

2. The wings V V, inclined upwardly in front, one placed on each side and at the lower end of piece C, as and for the purpose specified.

144,712.—Coating Tacks, Nails, and Screws, to Prevent Corrosion, and to Color Them.—GEORGE STARKS, Taunton, Mass., assignor to THE ALBERT FIELD TACK COMPANY, same place. Application filed September 25, 1873.

First dip them, when hot, into a composition consisting of lamp-black, boiled oil, and naphtha, thoroughly mixed and incorporated together; after which they are strained and placed in an oven and subjected to heat, which causes the coating to penetrate and bake upon their exterior. The tacks are then given a second coating of the composition, adding thereto japan; after which they are removed therefrom, and allowed to strain, and subjected to heat, when a hard shell or enamel is formed.

Claim.—1. As a new article of manufacture, the process herein described for treating tacks, nails, and screws, to prevent oxidation.

2. As a new article of manufacture, a tack, screw, or nail coated as above described, to prevent oxidation.

144,713.—Measuring-Can.—ARTHUR W. TICE and NATHAN F. SMALLEY, Boston, Mass. Application filed October 1, 1873.

A measuring-can, supported on legs, has an outlet-valve in its bottom, from which valve a stem extends up through the top of the can, and has a shoulder by which it is supported on a standard when elevated to open the valve.

Claim.—The tunnel or can, as constructed, with the valve-stem, its guide-arm, and stops arranged together and with the body and cover, in manner as described and represented.

144,714.—Ore-Stamp Feeder.—JAMES TULLOCK, Jamestown, Cal. Application filed September 2, 1873.

When the stamp falls a collar thereon strikes the end of a lever, and, through a connecting-rod, operates a rock-shaft so as to draw the tray back. When the stamp rises the tray will swing forward until a lug on the bottom strikes a bar or other object, producing a sudden check, which loosens and throws forward the contents of the tray.

Claim.—1. The oscillating tray B, supported by the links C, and operated by the shaft D, with its rocker-arm E and crank G, together with the lever I, the whole operated from the stem J by means of the adjustable collar K, substantially as and for the purpose described.

2. In combination with the oscillating tray B, operated as herein shown, the post or bar L for giving a concussive or abrupt stop to the tray, substantially as and for the purpose described.

144,715.—Binder's Attachment for Harvesters.—THOMAS URDAHL, Cross Plains, assignor to SIMEON MILLS, Madison, Wis.—Case B. Application filed August 22, 1872.

The cut grain that falls upon the platform is carried by a sweep-rake to the receiver. Said receiver, binder's stand, and

table are supported upon a carriage which is hinged to the platform.

Claim.—In combination with the grain-platform, the binding-carriage hinged thereto, consisting of the gavel-box or receiver A, having the binders' stands D secured to its opposite sides, the binding-table E secured upon its rear end, and the supporting-wheel also attached to said end, substantially as shown and described.

144,716.—Billiard-Table.—SAMUEL H. WALDIE, Belmont, Tex. Application filed August 4, 1873.

The end cushion-rail is double, the inner one taking out and uncovering the pockets of the bagatelle-table, and at the same time exposing, upon the under side of said inner rail, numbers to correspond with the bagatelle-pockets.

Claim.—1. In combination with billiard-table A, having apertures *d* and outer bar C, the false bar B with lugs *a*, substantially as and for the purpose described.

2. The outer bar C having horizontal and vertical recesses *b'* for adjusting false bar as billiard-cushion or head-board, as specified.

144,717.—Road-Scraper.—JAMES W. WESTON, Windsor, Ill., assignor to TUBBEE M. JACKSON, same place. Application filed October 25, 1873.

The wheel nearest the point of draft is pivoted to the long lever F, and is capable of vertical adjustment, and when the lever is depressed, bringing the wheel in contact with the ground, the scraper can be readily turned. The wheel on the rear of the scraper is also capable of adjustment, and when depressed, in connection with the front wheel, the scraper is raised and supported on the wheels. The wheel P has a sharp edge, and is pivoted to a lever, R. The sharp edge engages with the ground, and by moving the lever the machine is guided in its direction.

Claim.—An improved grader, composed of the mold-board A, land-side B, point C, cross-beams D, steel plate E, lever F provided with a caster-wheel, H I, and locking-bar K, the levers L M, and caster-wheel N O, the guide-wheel P Q, and lever or handle R, constructed and arranged to operate in connection with each other, substantially as herein shown and described.

144,718.—Skate.—JAMES A. WHEELPLEY, Dartmouth, Nova Scotia. Application filed June 28, 1873.

The toe and front heel-clamps ride on a horizontal backward projection of the skate-iron, and are fastened at any point by a push-nut pressing the lower part of the skate-iron. The back heel-clamp is pivoted, and works in combination with a horizontal swinging lock-lever.

Claim.—1. A hand-nut, L, placed on the lower end of the clamp, and arranged to fasten it down to the edge of the runner, in the manner described.

2. The semicircular brace N, held in a slot, O, of the runner, and made fast to the sole or heel-plate, as and for the purpose specified.

3. A vibrating heel-piece, H, clamped by means of a pendent shank and a cam-lever, as set forth.

4. A lever, Q, having slot and a projecting point, in combination with the shank of the heel-piece, provided with an incline, to operate as and for the purpose set forth.

144,719.—Carbonic-Acid-Gas Generator.—FRIEDERICK W. WIESENBROCK, New York, N. Y. Application filed October 11, 1873.

The generator is hung upon gudgeons, so that it can be oscillated, and is provided with bars crossing the interior, which prevent the marble-dust from caking. Above and connected with the generator is a dome containing a pivoted acid-chamber, the equalizing-pipe passing to the generator through the gudgeon.

Claim.—1. The arrangement of the gas-pipe I in connection with the dome F and hollow journal of gudgeon of the oscillating generator A, substantially as herein shown and described.

2. The combination of cross-bars E with the oscillating gas-generator A, substantially as herein shown and described.

144,720.—Ice-House.—ALFRED WILBUR, Cedar City, Mo. Application filed September 27, 1873.

The basement is made of brick or stone, and the floor is made double and filled with non-conducting material.

Claim.—1. The chamber E, having a floor, F, divided into tanks or water-reservoirs, substantially as shown and described.

2. The tanks or reservoirs G I L, partition-walls H, and spigots J, as and for the purposes described.

144,721.—Thrashing-Machine.—JOSEPH M. WILDERS, Croxton-Keyrial, England, assignor of one-half his right to WILLIAM SILVERWOOD, Baltimore, Md. Application filed September 4, 1873.

A feeding apparatus consisting of toothed bars, supported at their receiving ends upon links, and at their discharging ends upon cranks which operate them, and also give motion to a series of arms suspended over the discharging ends of the bars for evenly distributing the stalks to the thrashing-cylinder.

Claim.—1. The toothed carrier-boxes C, operated by the joint action of the crank-shaft D and the pivoted coupling-arms E, to give a greater vertical movement to the delivery than the receiving ends of said boxes, as and for the purpose described.

2. The combination, in a thrashing-machine, of an automatically-feeding platform of notched vibrating bars, C F, with an adjustable vibrating regulator, I J, and a thrashing-cylinder, as described.

3. The hinged guide-board N, in combination with the vibrating feeder C and thrashing-cylinder, as described.

4. An automatic grain-feeder for thrashing-machines, having a grain-feeding platform of vibrating notched bars, C F, an adjustable vibrating regulator and evener, I J, an operating crank-shaft D, and hinged guide-board N, the several parts being constructed and arranged for joint operation as described.

144,722.—Rotary Engine.—PETER WORRALL, Sugartown, Pa. Application filed September 6, 1873.

A high and low pressure cylinder with abutments are arranged on one shaft, and combined with segmental pistons fitting in recesses, and having circular heads, and are operated by guiding-crank pins on the journals, which pins strike against stationary cams on the case, and springs draw them to their normal position. The ends of the valves are triangular, and project inward, and are operated by the revolving wheels and springs connected to a lever.

Claim.—1. The cylinders A B, having recessed wheels C K on the same shaft D, and the former exhausting into the latter, in combination with arc sectional pistons E, having the circular head F, constructed and arranged to operate substantially as and for the purpose set forth.

2. The valve *a*, with the triangular ends *a'*, springs *w*, and bar X, arranged in combination with the cylinders A B, as and for the purposes described.

144,723.—Process of Retouching Photographic Negatives.—DAVID H. WRIGHT, Terre Haute, Ind. Application filed September 30, 1873.

Claim.—1. Imparting motion to the negative by means of suitable machinery or devices, so that by holding the retouching-pencil in proper position the retouching is performed by the motion imparted to the negative, substantially as described.

2. The improvement in the process of retouching photographic negatives by imparting motion to the retouching-pencil being held in the hand of the operator on a rest having vibratory motion, substantially as described.

3. The combination of a bar, B, having vibratory motion, with a photograph-easel, C, or hand-rest F, substantially as and for the purposes described.

4. The combination of the bar B, pitman *b*, eccentric *c*, wheels G K, and pulleys *d g*, with the negative-easel C or rest F, substantially as and for the purposes described.

144,724.—Track-Clearer.—ERNESTO ABBIATI, New York, N. Y. Application filed September 12, 1873.

The motion of the car revolves the toothed disk. Vertical plates, which protect the interior mechanism, are reciprocated by an eccentric pulley and toggle-joint levers, throwing off the snow impinging against them.

Claim.—1. The combination of the movable wings F F of a snow-plow with the chain H, pulley *f*, and eccentric pulley *e*, substantially as and for the purpose set forth.

2. The combination of the disk D, having projecting teeth *i i*, with the plow-shaped blades E E and movable wings F, substantially as and for the purpose described.

144,725.—Lawn-Mower.—WILLIAM ALLEN, Worcester, Mass. Application filed October 17, 1871.

The pivoted handle is adjusted in height, and its range of free play limited by set-screws and lugs on the frame.

Claim.—The combination, with the frame A A' and tongue or pole I J, of the adjusting and supporting screws N and lugs *s*, substantially as shown, for the purpose stated.

144,726.—Manufacture of Bessemer-Steel-Converter Tuyeres.—JAMES E. ATWOOD, Pittsburg, Pa. Application filed November 7, 1873.

Claim.—A tuyere for the manufacture of steel by the bessemer process, composed of fire-clay and loam or molder's sand, prepared substantially as described, for securing the vitrification of the tuyere, as specified.

144,727.—Chain Tackle-Block.—SAMUEL D. BACKUS, New York, N. Y. Application filed August 28, 1873.

A guide-roller is pivoted in the block above the sheave. Combined with the block is a supplementary frame carrying a locking-pin, arranged to drop between the guide-roller and sheave and lock the chain whenever in a vertical position. By simply raising the supplementary frame the chain is released.

Claim.—The combination of the arm *d*, stop *c*, roller *e*, and ferrule *f* with the chain and sheave, arranged to operate for the purpose and in the manner substantially as above described.

144,728.—Feather Duster.—CHARLES L. W. BAKER, Camden, N. J., assignor to JOHN L. MASON, same place. Application filed September 16, 1873.

Each tuft of feathers has the ends of its quills doubled over for the reception of the loop of a wire or string, previously passed downward through one of a series of holes in the head.

Claim.—The feather duster, consisting of the feathers B B applied to the back A by bending the quills of the feathers, passing them through perforations F in the back, and securing them by wire or cord D, substantially as and for the purpose set forth.

144,729.—Tire-Tightener.—WILLIAM BELLAIRS and WILLIAM OUGH, Atkinson, Ill. Application filed October 4, 1873.

Claim.—The combination, with the felloes A A and tire B, of the box C, dogs D D, bevel-headed bolt *a*, nut *b*, and catches *d d*, all substantially as and for the purposes set forth.

144,730.—Telegraph-Key.—CHARLES H. BILLINGS and GEORGE W. STOCKLY, Cleveland, Ohio. Application filed July 3, 1873.

Additional contact-points mounted on springs and having beveled faces, to insure good contacts and firm writing.

Claim.—1. The additional contact-points G H, arranged in relation to each other, to co-operate with the hammer and anvil D E of an ordinary telegraph-key, substantially as and for the purpose specified.

2. In a telegraph-key, the contact-points provided with the beveled or rounded faces, substantially as and for the purpose set forth.

3. The combination, with the anvil and lever of a key, of the spring or springs I J, carrying the additional contact-points, substantially as and for the purpose described.

144,731.—Mechanism for Reversing Engines.—GEORGE W. BISHOP, Brooklyn, N. Y. Application filed October 17, 1873.

Claim.—The combination, with a single set of ports for receiving the steam from the chest and discharging it into the cylinder, of passages for carrying the steam directly in the different directions and intermediately-seated cylindrical valve-blocks for directing or permitting the passages of the steam in different directions, the whole constructed and operating substantially in the manner and for the purpose described.

144,732.—Propelling Boats.—JAMES BLACK and GEORGE W. JONES, Philadelphia, Pa. Application filed April 11, 1873.

Claim.—A double hollow rudder, into which water is admitted and forced out again alternately, thereby propelling a boat or vessel, substantially as hereinbefore set forth.

144,733.—Hay-Press.—HENRY F. BLAKE, Liberty, Ill. Application filed July 26, 1873.

Each lever is pivoted between two hangers, which are supported by stay-rods and provided at their lower ends with hooks to catch on a corresponding hook on the follower, to prevent the levers from passing too far in or out. It also has a relief-door at one end of the bale-box, having a hinged bar which is pressed against the outer end of the relief-door by the hooked cam-lever which fastens on a pin in the recess of the said door. To release the bale after it is pressed, the lever is raised, which releases the hinged bar and allows it to swing outward, which gives the door a small movement to relieve the bale.

Claim.—1. The combination of the hinged relief-door D with the hinged bar G and hooked cam-lever *b*, as and for the purposes herein set forth.

2. The combination of the follower I, levers J J, hangers K K, hooks *h' h'* and *i*, and the ropes *f m*, all as and for the purposes herein set forth.

3. The pivoted upright hanger T, with rubber bumper *y*, for the purposes herein set forth.

144,734.—Cutting-Nippers, &c.—PETER BROADBOOKS, Batavia, N. Y., assignor of one-half his right to SETH WAKEMAN, same place. Application filed October 17, 1873.

The handle is adapted to carry pivoted jaws which are operated by an independent lever. The jaws are provided with cutting-edges, and can be removed and others substituted in the form of shears, punches, saw set or gummer, &c.

Claim.—The tool-stock A, having pivoted lever B' and spring D, in combination with the removable jaws C C', arranged and operating substantially as described.

144,735.—Automatic Lubricating Water and Gas Cock.—EDWIN F. BROOKS, Baltimore, Md., assignor to himself and CHARLES E. SEAL, Winchester, Va. Application filed October 8, 1873.

Within the valve-plug, at each extremity, is arranged a chamber to contain a lubricating material, from which the oil is expressed, by means of a piston and spring, through orifices in said plug connecting with the valve-casing.

Claim.—1. A gas or water cock valve constructed with an oil-reservoir, E, in one or both ends, connected with the outer surface of valve by a hole or holes, *c*, as and for the purpose specified.

2. The means for forcing the lubricant from reservoir, through hole or holes *c*, and between the valve and shell, consisting of the piston and rod F *f*, spring G, and screw-cap H, applied in the manner described.

144,736.—Hemmer for Sewing-Machines.—SAMUEL H. BRYANT, JAMES M. BRYANT, and HOSEA L. MCGAW, Pittsburg, Pa. Application filed August 8, 1873.

The main plate carries the guide and folder of the hem, and is extended forward and downward past the needle to press upon and flatten out the hem.

Claim.—1. The combination of the raised plate A', having the extension E to flatten the hem, with the combined gage and spreader B, open-flanged plate A, and sliding slotted plate C, substantially as specified.

2. The raised plate A', formed with the lateral extension E to flatten the hem, and provided with the combined adjustable gage, spreader, and folder B, substantially as shown and described.

144,737.—Purifying Water from Mines.—HUGH BURGESS, Royer's Ford, Pa. Application filed November 7, 1873.

The free acid with which the water is charged is effectually neutralized by the waste solution derived from the boiling or digesting of wood, straw, and other vegetable substances in a solution of caustic soda until the latter is nearly or quite neutralized.

Claim.—The treatment of mine-water by the admixture therewith of the waste solutions derived from the boiling of wood and other vegetable matter in alkaline solution, as set forth.

144,738.—Bag-Fastener.—SETH R. BUSH, Bush's Mill, Ohio. Application filed October 23, 1873.

Perforated plate and hook are connected to an open link, that can be easily attached or detached.

Claim.—The combination of the open link A, hook B, and perforated plate C, for the purposes herein set forth.

144,739.—Belting-Machine.—HENRI CARAMES, Bordeaux, France. Application filed April 14, 1873.

Movable top bellows of air-reservoir insure a regular and uniform speed to the machine, and also operate the discharge-nozzle for separating the perfect and imperfect material. A float in hopper, through intermediate mechanism, also operates the discharge-nozzles when the material therein is reduced to an improper extent. Adjustable valves control the passage of material between valves and plates *d*, the material closing the opening to the downward passage of air forced through the perforated air-pipes, which can therefore only pass upward through bolting-cloth.

Claim.—1. The combination, in a belting-machine, of an air-reservoir, the top or other part of which rises and falls as the pressure of air within the reservoir varies, and movable discharge chutes or valves, which are connected to the moving portion of the reservoir and adjusted thereby, substantially as and for the purpose set forth.

2. The combination, with the movable nozzles, of the float X in the hopper T, and intermediate mechanism, or its equivalent, as set forth.

3. The combination, with the bolting-cloth, of the frame D, plates *d*, and adjustable valves *f*.

4. The inclined plates *f'*, arranged below the plates *d*, as specified.

144,740.—Cultivator.—RICHARD S. CAVETT, Bedias, Tex. Application filed September 6, 1873.

The frame consists of four bars. The inner two are connected at the front ends by a clevis-link. The outer two beams are hinged at their forward ends to the inner beams. The plow-standards are fixed to the rear end of each of the frame pieces.

Claim.—The combination of beams A A A' A' and standards B B B' B' with the loose link-connections *g h e d* and *g n*, as and for the purposes described.

144,741.—Bronzing-Machine.—LOUIS G. CHAPUT, WILLIAM BRAIDWOOD, and JOHN BRAIDWOOD, New York, N. Y. Application filed August 7, 1873.

Claim.—1. The cords or strings *b*, running in an oblique direction by means of grooved rollers *d f*, in combination with the endless apron C, bronzing-roller D, and brushes *g g*, substantially as shown and described.

2. The comb A, in combination with the oblique cords or strings *b*, delivery-roller *i*, and apron C, substantially as and for the purpose set forth.

3. The combination of the inclined plane I, fountain H, bronzing-roller D, apron C, cords *b*, and brushes *g*, constructed and arranged substantially as shown and described.

144,742.—Rotary Printing-Press.—CYRIL C. CHILD, Boston, Mass. Application filed March 19, 1873.

The scraper is controlled both against and away from the fountain-roller by several screws, and the adjustment of any one screw affects no part of the scraper, except at the point where it is. Ink may thus be delivered in unequal quantities at different points. The trucks *g*, which bear the composition rollers, are made V-shaped to fit the bearers G. These bearers may be separated laterally by a right-and-left-hand screw, and by thus letting the trucks down cause the rollers to press harder upon the form. The impression-cylinder is more rapidly and accurately adjusted by having its movable bearings in standards adjusted by a differential or Hunter's screw.

Claim.—1. The inking device, consisting of the trough E, flexible plate *a*, screw *b*, slotted sustaining-plate *f*, and grooved nut *c*, as set forth.

2. The V-shaped bearings, each consisting of two longitudinal angular-sided strips, adjusted to and from each other by right-and-left-hand screw-bolts *o*, which are held to the type-bed by hooks *h*, in combination with V-shaped roller *g*.

3. Differential screw I, box *c*, arm or standard K, in combination with the cylinder of a printing-press, substantially as described.

144,743.—Ironing-Machine.—GIDEON W. COTTINGHAM, Saint Mary's, Tex., assignor to himself and JAMES P. COTTINGHAM, same place. Application filed October 27, 1873.

In a suitable frame a table is moved horizontally by means of rollers and cords under the sad-iron, which is attached by pivots to arms, and a rock-shaft that is operated by a lever, cord, and treadle.

Claim.—1. The table D having base *b*, vertical parts *b' b'*, and

elevated portion E, in combination with the guides C C and rollers g e, substantially as and for the purpose specified.

2. The curved arm S, having handle h and braces f f, in combination with the pivoted iron T, rock-shaft R, and uprights B B, all constructed and arranged for operation, as and for the purpose specified.

3. In combination, with the iron T, the arm S, rock-shaft R, lever P, cord O, and treadle M, all constructed for operation, as and for the purpose specified.

144,744.—Polishing-Tool.—HERBERT COTTRELL, Newark, N. J., assignor to COTTRELL STONE-MACHINERY COMPANY, New York, N. Y. Application filed April 25, 1873.

Claim.—1. In combination with a rotary polisher, the spring g, interposed between the body of said polisher at its center and the shaft or socket by which the polisher is rotated, essentially as described.

2. The rotary polisher, constructed of annular form, as described, and flexibly hung, essentially as herein set forth.

144,745.—Carving-Machine.—HERBERT COTTRELL, Newark, N. J., assignor to COTTRELL STONE-MACHINERY COMPANY, New York, N. Y. Application filed April 25, 1873.

By a flexible rod, slides, and pivoted connections the carving-tool is made to operate in any direction and at all angles.

Claim.—1. The swivel B and its pivot c, in combination with the pivots d d, the turning slide-guides a a, and the longitudinally-grooved bar D, essentially as described.

2. The upper pulley n, in combination with the extensible shaft G, the spring s, the flexible connections H H, the tool-spindle F, the turning head-block E, and the bar D, capable of lateral and up-and-down adjustment, essentially as described.

144,746.—Sleigh.—ALFRED DANIEL DE LANO, Goodrich, Mich. Application filed May 17, 1873.

The rear end of the tongue is mortised into a cross-bar, which is pivoted in front of a front beam, the draft, in this manner, to be applied directly to the front beam.

Claim.—The bob-sled having the annular ring D, pivoted bar E, hinged bolster G, reach H, and swivel I, all to operate in the manner described, and for the purpose mentioned.

144,747.—Fluid-Meter.—HENRY A. DESTER, Worcester, Mass. Application filed September 13, 1873.

The meter consists of four cylinders in the same plane radiating from a common center. The pistons are connected in pairs. The connecting-rods are slotted and halved together, and operate the cranks of the rotary valve and the register-stem.

Claim.—1. The combination and arrangement of the four cylinders A^1 A^2 A^3 A^4, the pistons B^1 B^2 B^3 B^4, and the rotary cylindrical valve D, provided with communicating slots i i' and passages a a, substantially as and for the purposes set forth.

2. The connecting-rods C C^2, slotted and halved together, as described, in combination with four pistons, whose axes are all in the same plane, as and for the purposes described.

144,748.—Pavement.—WILLIAM H. DE VALIN, Sacramento, Cal. Application filed June 18, 1873.

Claim.—A street-pavement composed of bricks, laid in rows on their longer edges, with spaces between the same filled with gravel or sand cemented with coal-tar, and with a top-dressing of coal-tar, alphalt, or its equivalent, the said bricks so laid being supported on an under course of bricks or other suitable stable foundation, as herein shown and described.

144,749.—Treating Bricks for Pavements.—WILLIAM H. DE VALIN, San Rafael, Cal. Application filed October 28, 1873.

Claim.—The process of treating bricks or porous stone with coal-tar, asphalt, or other suitable hydrocarbon, by immersing the bricks in the hydrocarbon and boiling the two together until the hydrocarbon contained by and surrounding the bricks has the consistency specified, as and for the purposes described.

144,750.—Bee-Hive.—JOSEPH R. EAST, Fincastle, Tenn. Application filed August 5, 1873.

The comb-frames are suspended, fitting loosely in a V-shed notch in the top of the outer frame-bar, and held from vibrating by a lateral cut in the base of the bottom bar of said outer frame. A sliding floor covers the moth-trap, which trap has induction but no eduction-ports at its sides.

Claim.—1. The removable frames a a', for containing the comb-frames c c, the same being provided with notches to receive said comb-frames, substantially as described.

2. The moth-trap formed of the sliding false bottom D, in combination with the bottom a' and openings d d in the side of the hive, as shown and described.

144,751.—Girder for Bridges.—JAMES W. EVANS, New York, N. Y. Application filed April 9, 1873.

The outer and inner tubes or sections of the chord are arranged to break joints, and they are strengthened by the wire-rope core a, which is firmly secured at the abutments. The projecting lips f f support sleepers for railroad-rails or the flooring of the bridge.

Claim.—1. The lower chord A, constructed of an outer tubular shell, d, inner tube b, wire-rope core a, substantially as described.

2. The shell d, provided with projecting lips f f for holding the sleepers g, substantially as described.

144,752.—Centrifugal Sugar-Draining Machine.—CHRISTOPH FISCHER, Gloucester, N. J. Application filed July 15, 1873.

The basket is stepped below, and is turned in the manner usual in this class of centrifugal machines. The sides of the basket are made with serrated edges. The devices for stopping and steadying the apparatus are mounted on a system of levers.

Claim.—1. The conical box C and conical opening in the raised center of the cylinder and bolts e s, in combination with the spindle D of a centrifugal machine supported below on a step, and having a bearing on the raised center of the cylinder A below the draining-basket, substantially as and for the purpose set forth.

2. The oil-reservoir d in the raised center of the draining apparatus and covering-plate f, combined and operating as set forth.

3. The cage F, formed with vertical serrations H and perforations e between them, when constructed and operating as set forth.

4. The lever L, having an axis suspended from the cylinder A, formed with a boss, N, which encircles the spindle D and bears against the friction-cone J, as herein set forth, for the purpose described.

144,753.—Rotary Grain-Distributer.—APOLLOS D. FOOTE, Berlin, assignor to ALBERT M. HELMER, Milwaukee, Wis. Application filed May 31, 1873.

The grain is received from the elevator-spout into a circular spout, divided into two parts, the upper of which is stationary, while the lower is supported and caused to revolve by means of a central axis mounted in suitable bearings, and is geared at its upper end with a horizontal shaft, which receives motion from a steam-engine or other motive power. The revolving portion of the circular spout is divided by means of radial partitions into a series of compartments, and at its lower end is formed trumpet-shaped, thereby forming a series of curved grain-distributer spouts. Within the upper or stationary portion of the spout a conical grain-director is supported by chains or links in such manner that, when desired, it may be drawn to one or the other side of the spout, and thereby control the particular point at which the distributer-spouts of the revolving portion of the circular spout shall be supplied with the grain, which is thus distributed by centrifugal force, and the trimming of the vessel so laden accomplished without resort to manual labor.

Claim.—1. A revolving spout for the purpose of distributing grain in the holds or other parts of vessels, barges, and other conveyances, substantially as described.

2. A conical grain-director arranged to control the supply of grain to revolving distributing spouts or tubes, substantially as described.

3. A grain-spout, a, divided into two parts, a^1 a^2, one of which is stationary, and the other caused to revolve, substantially as described.

4. A grain-spout, a, having a stationary part, a^1, grain-director d, and a revolving part, a^2, provided with a series of distributing-spouts, a^3, substantially as described.

5. In a grain spout or distributer, the combination of the stationary part a^1, grain-director d, shaft c, revolving part a^2, substantially as described.

6. In combination with the stationary part a^1 of a grain-spout or distributer, a, and a grain-director, d, supported by chains or other suitable means, and capable of adjustment by chains or their equivalents, a series of distributing-spouts, a^3, supported by and caused to revolve with a shaft, c, substantially as set forth.

144,754.—Bed-Bottom.—SAFFORD B. FREEMAN, Fort Wayne, Ind. Application filed October 30, 1873.

Ends of the slats lie on the horizontal portion of a wire-spring, which has, on each side, diagonally-descending portions, coiled at the bottom, with its ends clamped between two lateral supporting-bars, which in their turn rest on band-springs, at each corner of the bed, in form semicircular.

Claim.—The combination of the slats A A, wire springs B B, double bars C C, and C-shaped springs G G, all constructed substantially as and for the purposes herein set forth.

144,755.—Churn.—JOHN P. FRIEST, Chillicothe, Mo. Application filed April 16, 1873.

A detachable frame is adjustably clamped to the top of a churn, said frame having pivoted arms, which support a driving-pulley that communicates motion, by means of a band, to a pulley attached to near the top of a suspended and removable dasher-shaft.

Claim.—The adjustable and detachable frame F, provided with the journal-slots b, arms M, set-screw L, band-wheel R, and band i, in combination with the pulley H on the shaft D, provided with the paddles I, substantially as shown and described.

144,756.—Take-Up Mechanism for Looms.—CHARLES GAHREN, New York, N. Y. Application filed October 21, 1873.

In weaving corsets, or other irregular fabrics, the slack produced by the beat of the lay, in that portion of the web where the weft-thread has been inserted, is taken up by friction-rollers made to operate just as the lay begins to recede, and after the clamping-jaws, extending across the fabric, are closed upon it, by which mode of operation the drag from the take-up rollers acts only on that portion of the fabric between the clamps and the rollers.

Claim.—The combination, with the reed or beat-up, of a clamping device or mechanism and a take-up device or mechanism, arranged to operate in substantially the manner described, for the purpose set forth.

144,757.—Blast for Furnaces of Steam-Boilers.—RENÉ GIGODOT, Lyons, France. Application filed August 27, 1873.

A blast-current is obtained by introducing steam from a superheater into an open-mouthed conduit, which terminates in a tuyere beneath the grate-bars.

Claim.—The combination of the tubes a b, collectors A B, collector C, induction-pipe d, ejection-tube f, open conduit L, terminating in a tuyere beneath the grate-bars, all substantially as set forth.

144,758.—Stair-Rod Fastener.—WILLIAM B. GOULD, Montrose, N. J.—B. Application filed October 17, 1873.

A single piece of thin sheet metal is perforated at each end, one being bent at right angles, and two slits are cut, running longitudinally, so that the two side portions can be raised up to embrace the stair-rod, which is passed through it. The whole is formed, at one operation, from a single piece of metal.

Claim.—The stair-rod fastener A, made with two incisions, d d, between which the back piece e, and at the sides of which the forwardly-bulged parts f f, are formed, substantially as herein shown and described.

144,759.—Stair-Rod Fastener.—WILLIAM B. GOULD, Montrose, N. J.—Case B. Application filed September 23, 1873.

As an improvement upon patent No. 62,627, granted this party February 12, 1867, a screw-follower is substituted for his spring-follower, a metal disk being fitted within one of the hollow tips, to which is attached a screw-stem that extends through a threaded aperture in the end of the tip, a suitable knob being formed on the outer end of the stem to operate the disk or follower.

Claim.—The stair-rod fastener B, containing a follower, d, and a screw-spindle, c, to which said follower is attached, substantially as and for the purpose herein shown and described.

144,760.—Plow.—JOHN S. HALL, Pittsburg, Pa. Application filed June 20, 1873.

The beam is made of iron, the rear end being bifurcated and curving downward to receive the land-side adjustably, the rear end of which is secured to the rear branch by a screw and slotted wedge. The share and mold-board are cast in one piece, and the forward end of the land-side enters a recess in the rear of the nose of the plow. The rear end of the mold-board is secured to the rear end of the land-side by a bifurcated pivoted brace, in such manner that the mold-board can be rotated upon either side of the beam, so as to turn a furrow either to the right or left.

Claim.—The branches A^1 A^2 of beam and the sole F, constructed and combined with the nut-screw and slotted wedge in the manner and for the purpose specified.

144,761.—Wash-Boiler.—WILLIAM H. HAMMOND, Syracuse, Mo. Application filed June 28, 1873.

Claim.—The suspended inner flanged boiler B, having at its bottom the central slot g, peripheral openings l m, the depending transverse channel-guide k below said slot, and the inside raised plates n n', crossing or secured to each other centrally, and covering said slot and openings, substantially as specified.

144,762.—Spool-Case.—AMOS W. HARPER, Philipsburg, Pa. Application filed September 3, 1873.

The vertical tubes are filled with spools, and as they are removed from the lowest openings they are replaced by those above them sliding down.

Claim.—1. A revolving spool-case, consisting of a series of tubes of different sizes and lengths, all provided with openings i, and the shorter ones with bottoms e, substantially as and for the purpose specified.

2. A spool-case with the series of tubes a of different sizes and lengths, and fitted in a revolving frame, in combination with the case l with doors b d, all constructed and arranged as and for the purpose set forth.

144,763.—Paper-Holder Shelf.—GEORGE V. HAWKINS, Clayton, Mich. Application filed September 15, 1873.

Claim.—The within-described paper-stand or paper-holder, formed of a series of removable and gradually-diminishing sections, each section consisting of a platform, A, with bars B B, as described, and provided with pins a a, plate d, and pin b, all substantially as and for the purposes herein set forth.

144,764.—Rubber for Slates and Blackboards.—HENRY W. HOLLY, Brooklyn, assignor to L. A. JOCELYN, Yonkers, N. Y. Application filed November 1, 1873.

The covering is wrapped around the block, and its edges firmly secured in a cut or groove in the block.

Claim.—The rubber for slates and blackboards composed of the block grooved, as described, and the covering applied to it and secured, substantially as and for the purpose herein set forth.

144,765.—Relief-Valve for Steam Fire-Engines.—WILLIAM JEFFERS, Pawtucket, R. I. Application filed December 20, 1871.

A water-passage leading from the discharge to suction side of the pump of a fire-engine, is provided with a spring-valve capable of being set at any given pressure by an independent screw, and said pressure is indicated by an index-wheel.

Claim.—1. In combination with the water-passage W, leading from the discharge to the suction side of the pump in a fire-engine, and a diaphragm or valve-seat, E, arranged across said passage, the spring relief-valve s, capable of being set at any given pressure, and the independent screw J, for the purpose of counteracting the spring when necessary, substantially as described.

2. The combination of the valve s, rod s, collars r s, spring t, shaft h, and index-wheel H, constructed and operating substantially as shown in Fig. 2, for the purposes set forth.

3. The hollow shaft h, having the graduated hand-wheel H, and the grooves s s, in combination with the spring-valve, guides, and supporting-frame, substantially as and for the purposes set forth.

144,766.—Iron Bridge.—PHELPS JOHNSON, Springfield, Mass. Application filed October 20, 1873.

An iron-truss arch, consisting of two parallel members, each member being composed of short tubular sections, which members are placed sufficiently far apart to allow the ties, struts, and braces, extending from the chord to the arch, to take a central bearing on the king-bolt connecting the members of the arch, so that all strains transmitted from the chord shall take effect centrally upon the king-bolts between the arch members, instead of outside the arch and partially on one side, as is the case when the ties, struts, and braces are connected to the arch outside the members thereof, thus avoiding the undue strain to which the braces, &c., extending from the deflected side of the chord to the corresponding side of the arch, are subjected.

Claim.—1. The combination of the double arch made in sections B, with the king-bolts a, vertical ties f, struts b, diagonal braces c, tie-blocks n, bottom chord c, and end bolts e', substantially as described.

2. A truss-bridge wherein the arch or top chord is composed of two members extending parallel with each other, and connected by king-bolts a, extending from one member to the other, and with the ties, struts, and braces extending upward from the bottom chord, and taking a bearing between the two members of the top chord or arch, substantially as described.

144,767.—Toy Propeller.—GEORGE W. JONES, Philadelphia, Pa. Application filed October 30, 1873.

A compressible elastic bulb, held in the hand, connects, by a flexible tube, with an air and water chamber on the toy boat, and in part, at least, below the water-line. Said chamber has an exit pointing rearward, through which the chamber is supplied and exhausted, to propel the boat, at pleasure.

Claim.—The combination, with a toy boat or vessel, of a compressible air-bulb, F, or its equivalent, a connecting-tube, and an air-and-water cylinder or chamber communicating with the end of the boat or vessel, substantially as shown and described.

144,768.—Kneading-Board.—HARVEY P. JONES, Davenport, Iowa. Application filed June 21, 1873.

Claim.—As a new article of manufacture, a metallic kneading-board, A, provided with a ledge, C, as set forth, and for the purposes described.

144,769.—Combined Table and Secret Writing-Desk.—CHARLES KADE, Lexington, Mo. Application filed May 21, 1873.

The body of the table is formed of a box-frame, supported on its rear side by two legs, and provided at its front side with two three-jointed wooden hinges, which connect with a front blind piece or false drawer, having a leg at each end. Said false drawer and extension act as a support to the hinged leaf of the table top. The box-frame contains a secret desk, which is held in place by catches, but when released it is forced upward by four springs, that are coiled around shafts attached to the bottom of the box-frame. The upper end of each spring bears a roller, on which the desk is supported.

Claim.—1. The springs m m, provided with rollers p p and arranged in the frame A, for throwing the desk E upward, substantially as herein set forth.

2. The combined secret writing-desk and table described, consisting of the frame A, legs B B', three-jointed hinges f f, front piece a, box b, top C C', hinged leaf D, desk E, and springs m m, all constructed substantially as and for the purposes set forth.

144,770.—Eaves-Trough.—PETER F. KIBLINGER, Millersburg, Ind. Application filed April 10, 1871.

The gutter is grooved near its upper edges, and in said grooves are placed the cross-braces. The upper edges are bent over and turned down, thereby securing the braces and strengthening the gutter, and allowing it to be placed on either eave of the roof.

Claim.—The within-described eaves-trough, having the beads B and grooves C to receive the braces D, and the turned-over edges A A on each side, constructed so as to be attached to the roof on either side, as set forth.

144,771.—Making Barrel-Heads.—JAMES L. KILGORE, Cleveland, Ohio. Application filed October 21, 1873.

The barrel-head passes over vertically self-adjusting feed-rolls and beneath stationary pressure-rolls, and a revolving cutter which dresses one side of the head.

Claim.—1. The adjustable brackets G and wheels E and L, in combination with the pinions K and rollers B B C C, substantially in the manner as and for the purpose set forth.

2. The puppets I, springs J', brackets G, wheels E L, and pinion K, as arranged in relation to and in combination with the rollers B B C C and cutter D, substantially in the manner as and for the purpose set forth.

144,772.—Separating Precious Metals from Ores.—SOLOMON W. KIRK, Philadelphia, Pa. Application filed April 23, 1873.

The roasted and pulverised ore, together with mercury, is placed in a digester, the air exhausted, and heat applied. One portion of the mercury goes to form cinnabar, and the other forms an amalgam with the metal. The heat is then raised, driving the mercury and sulphur over into a condenser, leaving the metal behind in the digester.

Claim.—1. The process herein described for separating the precious metals from the matrix, by subjecting the mixed pulverized ore and mercury to heat *in vacuo*, substantially in the manner and for the purpose described.

2. The mode herein described of separating the precious metals and recovering the mercury, viz., subjecting the ore previously pulverized and roasted, mixed with a sufficient quantity of mercury, to heat *in vacuo*, and condensing and retaining the vapors given off, substantially as and for the purpose specified.

144,773.—Vegetable-Cutter.—JACOB KRAM, Germantown, Pa. Application filed June 26, 1873.

A partition in the box prevents the meat from turning with the rotating cutter, and serves as a stationary knife in cutting the meat. The follower sits astride of the partition, and is thus prevented from turning.

Claim.—The combination of the case A, having the opening G and partition F, with the knife D and follower E, substantially as specified.

144,774.—Wash-Boiler.—RALPH LAWYER, Pittsburg, Pa. Application filed July 30, 1873.

Claim.—1. The vessel *a*, provided with perforations *c*, the upwardly-curved flange *e*, vertical flange *f*, and tube *b*, substantially as shown and described.

2. The vessel *a*, provided with the flange *g* on its lower edge, in combination with the cross-bar A, engaging with lugs on the sides of the boiler, substantially as described, and for the purpose set forth.

144,775.—Cotton-Press.—THOMAS D. LEONARD, Waco, Tex., assignor of two-thirds his right to JOHN D. JOHNSON and BENJ. C. DRURY, same place. Application filed June 7, 1873.

On the bed-frame of the press a second frame moves on rollers. The follower is made fast to one end of this movable frame, and the bale-box moves horizontally by action from a right-and-left-hand screw, so that each turn of the screw moves both follower and bale-box toward each other, each half way. The box has detachable bottom, and may be turned vertically on trunnions, so as to be more readily filled.

Claim.—1. The combination of the sectional box J, the detachable bottom J′, and block H′ with the pivoted levers G attached thereto, and arranged to operate in the manner shown and set forth.

2. The cotton-press having the main frame A, movable press-frame B with follower I, movable bale-box J, screw D, blocks E, levers G, and block H H′, all constructed and arranged to operate substantially as and for the purposes herein set forth.

144,776.—Bale-Tie Clamp.—THOMAS D. LEONARD, Waco, Tex., assignor of two-thirds his right to JOHN D. JOHNSON and BENJAMIN C. DRURY, same place. Application filed July 26, 1873.

One end of the band is passed through the recess *a*, the band is passed around the bale, and the other end inserted under the clamp. By working the lever backward and forward it will advance on the ratchet-bar, and thus draw the two ends of the band together to be fastened.

Claim.—The mortised lever A provided with roller B, recess *a*, and dogs D D, in combination with the double ratchet-bar C with offset *d* and cam-lever G, and the stirrup *f*, all constructed and arranged substantially as and for the purposes herein set forth.

144,777.—Bottle-Stopper.—HENRY S. LESHER, New York, N. Y. Application filed September 30, 1873.

A hollow tube, having a ball at its lower end and valve attached thereto, works in a hollow wooden stopper fastened in the mouth of the bottle, so when the tube is pushed in the bottle can be readily filled, the valve closing the lower end of the stopper as the bottle fills.

Claim.—1. The hollow wooden stopper B, combined with tube D, as and for the purpose set forth.

2. The within-described bottle-stopper, consisting of the hollow wooden stopper B, tube D, cap C, valve G, and ball *d*, all constructed and arranged in the manner specified.

144,778.—Steam-Boiler.—GEORGE G. LORDELL, Wilmington, Del. Application filed September 30, 1873.

A vertical tubular boiler has below the lower tube-sheet a continuation or leg forming the rear part of a fire-place, the sides and front of which are composed of brick. The tubes diverge from the lower to the upper tube-sheet, for the purpose of preventing priming in boilers.

Claim.—1. A vertical tubular boiler having below the lower tube-sheet a continuation or leg, forming the rear, or part of the rear, of a fire-place, the sides and front of which are composed of brick-work, all substantially as and for the purpose herein set forth.

2. A vertical tubular boiler having tubes which diverge from the lower to the upper tube-plate, as set forth.

144,779.—Fly-Brush.—JOHN A. LYLE, Bridgeport, Ohio. Application filed September 19, 1873.

The outer lower portion of the body of the brush has the feathers curled in planes, the direction of which is tangential to its cross-section.

Claim.—As a new article of manufacture, the brush having the ball G, flat braid *a*, and the ribbon braid *b*, the feathers extending down on the handle to B′, constructed substantially as and for the purpose set forth.

144,780.—Gate.—GEORGE W. MACKEY and GEORGE S. MACKEY, Lathrop, Pa. Application filed August 29, 1873.

A gate having trunnions at the tops of its posts and centrally in the end bars, the gate-rails at one side of the center balanced by weights at the extremities on the other side, so that when unlatched a half turn may bring the weights down and give passage-way. The hinges or trunnions consist of a bracket attached to the post, with a bearing and upward-turned ears or lugs holding a transverse pin which secures the headed journal in position.

Claim.—In combination with the posts *a* and gate *b c d*, the journal *e* with head 1, and bracket 2 with ears or lugs 3, all constructed and arranged for operation, as and for the purpose specified.

144,781.—Reed-Organ Action.—WILLIAM N. MANNING, Rockport, Mass. Application filed August 23, 1873.

The wind-chest is above the plane of the keys. Vertical push-pins, held in place by a rubber partition embracing them, tip the tails of the wind-chest valves.

Claim.—1. The arrangement of the wind-chest, valves, push-pins, and keys of an organ, as hereinbefore described, by means of which one or more sets of reeds can be placed in such a position that a tuner can have access to them without disturbing the action, substantially as specified.

2. The guide-strip *n*, passage *t*, and flexible guide *c*, combined with the push or lifting pin B of the valve C, substantially as described.

144,782.—Heel-Boot for Horses.—WILLIAM MATHIS, New York, N. Y. Application filed June 14, 1873.

Claim.—1. The downward-projecting lip or tongue E as the back of heel-boots for horses, in combination with a suitable metallic plate, *m*, between the lining and outer covering in the cap or after part B, and projecting lip E, substantially in the manner and for the purpose set forth.

2. In heel-boots for horses, the projecting lip or tongue E, to fit into the hollow between and below the quarters of a horse's foot, in combination with a serrated plate, D, attached at the front to the straps *a a*, substantially as and for the purpose described.

144,783.—Middlings-Belt.—ALFRED G. MOWBRAY and HARRY W. MOWBRAY, Stockton, Minn. Application filed September 11, 1873.

Series of graded bolt-reels of small diameter, each having two conveyers with regulating-slides, so that the operator can separate the middlings and fine bran, as desired, the fine bran carried off at one end by the lower conveyer, and the middlings carried by the upper conveyer to the head of the next bolt of the series, this operation being repeated until the middlings become clear and pure.

Claim.—The combination of a series of bolts of small diameter, each having two conveyers, *a* and *c*, and regulating-slides *b b*, all constructed and operating substantially as described, for the purposes specified.

144,784.—Cotton-Planter.—CORNELIUS H. NIXON, Polo, Ill. Application filed August 21, 1873.

A bearing for the front ends of the triangular frame is pivoted at each end to adjusting-plates. Motion is transmitted to the sliding plate through an endless chain and universal gear situated in the pivoted front bearing.

Claim.—1. The combination of the standards *m m*, axles *l l*, notched plates 2 2, clamps 3 3, and pivoted cross-frame *n*, as and for the purposes herein set forth.

2. The combination of the axles *l*, wheels *d e*, chain *g*, shaft *h*, gears *i j e*, universal-joint shaft *t*, wheel 4, and slotted rotating hopper *u*, with feed-cylinder 6, all constructed and arranged substantially as and for the purposes herein set forth.

144,785.—Plow.—JAMES OLIVER, South Bend, Ind. Application filed September 20, 1873.

The standards, mold-board, and land-side present a united curved front, on which rests the point with its long upward-projecting cutter.

Claim.—The standard B, extended forward, as shown at *a*, the mold-board and land-side extending forward even with the standard, forming a uniform curve, which forms a seat for the colter D, the part C being supported by the enlarged foot of the standard, as and for the purpose set forth.

144,786.—Whiffletree.—JOHN PARKER, Pontiac, assignor of one-half his right to JAMES A. HUBBS, Cato, Mich. Application filed September 9, 1873.

Claim.—The whiffletree A, the central plate B nearly encompassing the whiffletree, and having a shoulder, *a*, and the roller D pivoted between the ends of the plate, all combined substantially as described, and for the purpose set forth.

144,787.—Car-Brake.—JAMES B. PELTON, Mount Pleasant, Md. Application filed June 25, 1873.

Claim.—1. The tube C, jointed to a pulley-frame, D, and extending over the platforms of two adjacent cars, all combined as and for the purpose described.

2. The tension-tube C, made in two hinged sections to fold back on the car to which it is attached when not in use, combined as and for the purpose described.

144,788.—Steam-Cylinder and Piston-Valve.—GEORGE G. PICKING, Kingsland, and WILLIAM HOPKINS, Islington, assignors to themselves, JAMES HART, and JAMES L. SAMPSON, London, England. Application filed May 19, 1873.

A steam-cylinder is combined with a main piston-valve and an auxiliary valve or bar, each having a cavity and suitable parts, so as to partly shift or start the main valve for the purpose of changing the flow of steam to the cylinder by steam from the cylinder, and completes its movement by steam from the bar steam-chamber, and cause the shifting of the bar.

Claim.—1. The combination of a steam-cylinder, a reciprocating bar, and a slide-valve, each having a cavity and suitable parts, so as to partly shift or start the main valve for the purpose of changing the flow of steam to the main cylinder by steam from the cylinder, and completes its movement by steam from the bar steam-chamber, and the shifting of the bar by steam from the cylinder, as described.

2. The simple arrangement of ports 15 16 20 21, in combination with the steam-chamber, of the bar for causing the slide-valve to commence its stroke by steam from the cylinder, and complete it by steam from the bar.

3. The combination, with a valve-casing, of a spindle, 26, handle 29, bosses 30, plugs 31, pins 32, and projections 33, for preventing the stopping or sticking of the valve and bar, and to allow of them both being moved by one movement of the handle.

144,789.—Binder's Attachment for Harvesters.—HENRY PORTER, Polo, Ill. Application filed October 16, 1873.

The cut grain is carried by horizontal and elevating aprons to the grain-receiver, which is provided with elastic strips, on which the grain falls.

Claim.—The binder's rack H, provided with flexible strips *n*, substantially as described.

144,790.—Shifting Top for Vehicles.—HENRY K. PORTER, Boston, Mass. Application filed January 29, 1872.

The rail is designed to be of cast metal made malleable.

Claim.—1. A cast-metal shifting-top seat-rail, having the hollow bosses A A for the reception of the wrought-iron bolts or equivalent wrought-iron pivots, substantially as described and shown.

2. The hollow or angular stud *c*, formed upon rail *a*, substantially as and for the purposes specified.

3. The shoulder or head *c*, formed upon rail *a*, and cut through at a right angle with its circumferential line, substantially as described and shown.

144,791.—Rake.—LUTHER A. POWERS, West Meriden, Conn. Application filed August 27, 1873.

Hooked screw-bolts pass through the handle, and clasp firmly the bent braces. A hooked screw-bolt also secures the handle to the head, the hook or bend of the bolt passing through the handle a few inches from the head of the rake.

Claim.—The herein-described rake, consisting of the head A, handle C, and braces E, when the said handle is secured to the head by the hooked bolt D, and the braces to the handle by the hooked bolts F, all as set forth.

144,792.—Portable Fly and Mosquito Net.—THOMAS M. PRENTISS, Boston, Mass. Application filed July 21, 1873.

A gauze curtain is attached to the outer edge of an umbrella, and extends downward a sufficient distance to protect a person from insects.

Claim.—In combination with an ordinary umbrella, a gauze curtain extending down from its outer edge, as and for the purpose substantially as described.

144,793.—Cotton-Bale Tie.—FRED QUARLES, Waco, Tex. Application filed August 23, 1873.

Claim.—The cotton-bale tie consisting of the wedge-shaped plate, having oblique slot on one side and a perforation at one end, in combination with a wire band, one end of which is secured within the perforation and the other adapted for looping in the slot, substantially as specified.

144,794.—Insulating and Finishing Compound for Conducting-Wires.—THOMAS L. REED and EUGENE F. PHILLIPS, Providence, R. I. Application filed October 29, 1872.

Wires for conducting electricity are coated with an insulating compound of Canada balsam, paraffine, and bees-wax, with or without coloring matter.

Claim.—The compound composed of Canada balsam, or equivalent gum, paraffine, and bees-wax, with or without coloring pigment, for insulating, and for giving to the telegraphic conducting-wires a finished exterior, substantially as described.

144,795.—Wash-Boiler.—WILLIAM REHEMEIER, Homburg, Prussia. Application filed August 13, 1873.

The central perforated tube is provided with a funnel that contains chemicals, and also serves to operate a two-way plug or valve inserted in said tube for the purpose of directing the water in an upward or downward direction.

Claim.—1. The combination, within a washing-tub, A, of the perforated pipe C, plug E, and funnel D, when the plug E is provided with the perforations *a* and *d*, and with the inner partition *b*, substantially as described.

2. The combination of the supply-pipe F, central pipe C, adjustable metal plug E, and funnel D with the overflow-pipes I and outlet-pipe J, substantially as shown and described.

3. The combination of the supply-pipe F, central pipe C, and adjustable plug E with the overflow-pipes I, perforated false bottom H, and outlet-pipe J, substantially as shown and described.

144,796.—Lithographic Printing-Form.—IRA REYNOLDS, Dayton, Ohio, assignor to REYNOLDS & REYNOLDS, same place. Application filed March 21, 1873.

The series of stones composing the form are squared, so as to fit closely together, and are equalized in thickness by means of a cement backing. They are also arranged to be removable at will.

Claim.—A lithographic printing-form consisting of a series of stones of equal, proportionate, or multiple size, equalized in thickness, and arranged substantially as described, so that any one or more of the stones may be removed at will, and others substituted therefor.

144,797.—Band Sawing-Machine.—JOHN A. ROCHE and GERRIT V. ONTON, Chicago, Ill.; said ONTON assignor to said ROCHE. Application filed September 11, 1873.

The saw-guide is attached to one end of a horizontal bar which is made vertically adjustable.

Claim.—1. The arm or lever L, supporting the guide T, and adjustably connected with the stem O, all arranged above the table F, leaving an open space between the arm and table, substantially as specified.

2. The adjustable back-guide and saw-support T, affixed to the guide-arm L, with the beveled washers *g* and set-screws *r*, constructed in the manner and for the purpose set forth.

3. The combination of the spring E, support D, and guide T, arranged as and for the purpose herein described.

144,798.—Stock-Car.—OLIVER SEVERANCE, Middlebury, Vt., assignor to A. J. SEVERANCE, same place. Application filed October 1, 1873.

Claim.—1. A stall for stock-car, consisting of the inclined floor C and the adjustable partitions D, confined by grooved posts *a*, substantially as described.

2. The step-bars *a′* attached to the top and to the bottom of the slotted posts *a*, in combination with the adjustable partitions D, as and for the purpose herein specified.

3. The adjustable tiers, each consisting of two or more stalls, constructed as described, each tier constituting a series of compartments, combined in one solid and removable part, as and for the purpose set forth.

144,799.—Stilt.—THOMAS J. SHERARS, Ypsilanti, Mich. Application filed May 13, 1873.

Claim.—The improved stilt, consisting of the foot-rest B, provided with the downwardly-inclined pins C C, in combination with the leg or staff A, having the upwardly-inclined holes *a a*, substantially as and for the purpose specified.

144,800.—Paper Box.—EDWIN M. SLAYTON, Conquest, N. Y. Application filed October 17, 1873.

Claim.—The seamless package, herein described, consisting of the body A, exterior hoops *a a*, interior hoops or linings *d d*, and concavo-convex heads B B, as and for the purpose specified.

144,801.—Blacking for Shoes, &c.—JAMES L. SNEED, Frankfort, Ky. Application filed October 30, 1873.

Pulverised coke, one pound; molasses, three ounces; vinegar, three ounces; litharge, one ounce; sperm-oil, one-half ounce.

Claim.—The within-described compound for shoe-blacking, consisting of the ingredients substantially as set forth.

144,802.—Syringe and Pump.—JOSEPHUS SPEAR, Philadelphia, Pa. Application filed November 2, 1872.

The syringe has a tapering nozzle containing a sheet-metal valve. The packing is held between two sheet-metal plates, the upper one having a tubular projection to receive the end of the hollow piston-rod. The movement of the piston is limited by ferrules arranged on either end.

Claim.—1. A syringe having a tapering nozzle, *d*, and a thin metal valve adapted to and fitting the said nozzle, as set forth.

2. The contracted tapering end of the piston-rod, in combination with the ferrule *f* and handle E, as set forth.

3. The contracted tapering end of the piston-rod, in combination with the ferrule *f* and the adjustable piston.

144,803.—Machine for Separating Rice.—HENRY B. STEVENS, Buffalo, N. Y., assignor to GEORGE L. SQUIER, same place. Application filed July 30, 1873.

Claim.—1. In a grain-separator, the combination, with a fan or equivalent means for producing an air-current, of an inclined table provided with a roughened surface and suitable mechanism for imparting to it a vibratory or rocking motion, so as to cause the two kinds of grain to be separated to work in opposite directions on the table, substantially as and for the purpose hereinbefore set forth.

2. In combination with a face and roughened table, the sup-

porting-arms *F F*, arranged at the end of the table and pivoted, as described, so as to produce such a motion as will cause the mass of grain agitated thereon to work in a thickened layer centrally and longitudinally of the table, while the rough and unhulled kernels are thrown to either edge of the layer, so as to be carried backward by the blast, the hulled kernels working down the incline in the opposite direction, as hereinbefore described.

3. The combination, in a grain-seperator, and with the fan B, of the air-passage *r*, and an inclined table provided with a roughened wire-cloth or other perforated surface, *s*, and tight bottom E, arranged so as to leave a space, *q*, between the latter, substantially as and for the purpose hereinbefore set forth.

4. The combination, with a fan and roughened inclined separating-table, of the central discharge-apertures *h* at the lower end, and the discharge-apertures *i i* at the upper end, of the table, as and for the purposes hereinbefore set forth.

5. The combination, in a grain-seperator, of the pivoted hopper *N*, provided with the thin sheet-metal spout *n*, and set-screws for holding it in place after it is adjusted, whereby a regular and proper feed is affected by the tremulous motion imparted to the spout by the jar of the machine, as hereinbefore set forth.

6. The combination, in a grain-seperator, and with the fan and oscillating table, of the adjustable deflecting-board a^2, for regulating and directing the air-current, substantially as hereinbefore set forth.

144,804.—Safety-Platform for Railway-Cars.—RICHARD STRODE, Coatesville, Pa. Application filed April 8, 1873.

Plates extending from one side of one beveled platform over the other, to prevent persons falling between the cars.

Claim.—The combination, with the end-beveled platforms B B, of the plates C C, extending from one platform and overlapping the other, as and for the purpose set forth.

144,805.—Washing-Machine.—JOHN TRICKETT, Quincy, Ill. Application filed June 7, 1873.

Is constructed with a corrugated center-roll resting upon a bed of smaller ones pivoted to a cross-bar, outside of which are rolls rigidly connected to the bar having slots, into which the outside rolls of the bed are fitted to guide the clothes through the machine. The journals of the larger roll pass through the tub, over which rests a spring or lever, by which the tension of it is regulated.

Claim.—The combination of the pivoted bars or springs F, side pieces E, straps H, self-adjusting fluted roller B', crank E, small fluted rollers *c*, and transverse guides G, constructed and arranged substantially as described.

144,806.—Revolving Stool or Chair.—JACOB J. VOLLRATH, Sheboygan, Wis. Application filed September 13, 1873.

The stool top has a raised flange and a groove upon its upper surface, and a hollow hub in the center, and the seat-bearing spider has a grooved under surface to extend upon and over the flange and groove in the stool top; and these two parts are united by a pivotal screw-bolt.

Claim.—1. The revolving stool or chair top A, having the raised rim or flange, the groove, and the central hollow hub, combined with the spider B, having a groove on its under surface and a central aperture, in the manner and for the purpose set forth.

2. The top A, constructed as described, and spider B, combined therewith and united by the bolt D and nut *d*, in the manner set forth.

144,807.—Trimming.—WILLIAM WALKER, Brooklyn, assignor to GEORGE H. WOOSTER, New York, N. Y. Application filed October 17, 1873.

Claim.—As a new article of manufacture, the trimming herein described, composed of two pieces of fabric stitched by two parallel rows of stitching—that is, one row along the edge of each piece—and united by one or more threads laced into or passed around the threads of the duplicate rows of stitching, essentially as specified.

144,808.—Miner's Pick.—RICHARD K. WALTON, Clarington, Ohio. Application filed July 21, 1873.

Claim.—1. As an improvement in miners' picks, the detachable bit A, having the angular groove *b* and the triangular-shaped points *a a*, as shown and described.

2. The bit A, provided with a screw-threaded tenon having a flattened side, in combination with a head, C, and clamp-screw D, as shown and described, for the purpose specified.

144,809.—Apparatus for Drawing Effervescent Liquids.—THOMAS WARNER, New York, N. Y. Application filed September 4, 1873.

A pipe has at one end a reservoir with a discharge-nozzle and a valve, and, at the other, means for attaching the pipe to the vessel from which liquid is to be drawn. This pipe has two valves, one to cut off communication between the vessel and the reservoir, the other to allow the surplus gas to escape. The object is to prevent dissipation of gas through the forcible expulsion of the liquid, and at the same time to retain as much gas as possible in the vessel.

Claim.—1. The pipe B, having the valves D E for controlling the flow of liquid and gas from a liquid-containing vessel into a pressure-relieving chamber having a discharge-spout, F, and valve G, all constructed and adapted for use substantially as and for the object specified.

2. The described combination of the pressure-relieving chamber A, having the spout F and valve G, with the pipe B, having the valves D E, the pipe being adapted to a vessel containing effervescent liquid, in the manner and for the purpose specified.

144,810.—Overshoe.—GEORGE WATKINSON, New Haven, Conn., assignor to THE L. CANDEE & CO., same place. Application filed August 16, 1873.

Claim.—As an article of manufacture, an india-rubber overshoe in which the front extends up, as at B, and the heel as at A, and cut both from the points B and A to meet at C, forward of the upper edge of the instep portion, as herein described.

144,811.—Draft Attachment for Plows.—NORMAN WESTCOTT, Nelson, assignor of one-half his right to DWIGHT CROSS, Morrisville, N. Y. Application filed May 27, 1873.

The rear end of the pole is supported by a single adjustable gage-wheel, and is connected with the plow-beam by a double-hinged joint, which permits a draft in any direction, the plow being kept erect.

Claim.—The combination of plow-beam O, double-jointed coupling A U Y, pole C, cheek-pieces P, having a vertical series of holes, *p*, and single gage-wheel B, substantially as specified.

144,812.—Unison-Stop for Printing-Telegraphs.—CHARLES J. WILBY, New York, N. Y. Application filed August 18, 1873.

Pin or cam on type-wheel shaft engages once on each revolution with a tooth on the arc-section of a swinging lever, depressing it until it is brought into contact with and locks type-wheel.

Claim.—A unison-stop, composed of the stop A, the cam G, the pawl H, cam I upon the printing-lever P, constructed, arranged, and operating substantially as set forth.

144,813.—Sucker-Rod Joint for Pumps.—ABNER M. WILLIAMS, Oil City, Pa., assignor of one-half his right to CHARLES H. DUNCAN, same place. Application filed October 15, 1873.

The socket-piece has an internal shoulder to relieve the rivets of the vertical strain, and has four straps for attachment to the sucker-rod.

Claim.—A sucker-rod joint consisting of the socket A, with interior shoulder *a* and the four extended wings or straps C C C C, all formed of one piece of metal, as and for the purposes herein set forth.

144,814.—Revolving Fire-Arm.—DAVID WILLIAMSON, Greenville, N. J. Application filed November 12, 1873.

The cylinder is arranged to swing laterally when the center pin is withdrawn, and mechanism is provided for limiting the lateral movement of the cylinder and of the center pin, so that the latter may be used for extracting the empty cartridge-shells without detaching it from the arm.

Claim.—1. The combination, with a cylinder which swings laterally for the purpose of loading, &c., of a vibrating slotted arm or plate, substantially as herein described, whereby the lateral movement of the center-pin and rammer is limited and brought in position, for the purpose set forth.

2. The plate *b'* having slot *x* and bolt or screw *f*, in combination with arm *b* and cylinder B, substantially as and for the purpose specified.

3. The combination, with the cylinder B, tube *a*, and arm *b*, of the slotted plate *b'*, the frame A having slot *y*, bolt or screw *f*, and shaft D, all constructed substantially as and for the purposes herein set forth.

144,815.—Revolving Fire-Arm.—DAVID WILLIAMSON, Greenville, N. J.—Case B. Application filed November 12, 1873.

Claim.—1. A cartridge-extractor for revolving fire arms, made in sections, and the sections operating successively, substantially as and for the purposes herein set forth.

2. The cartridge-extractor sections D D, provided with projections *a a*, of T or other suitable shape, in combination with the tubular end of the extractor-spindle C, provided with longitudinal slots of unequal length, substantially as and for the purposes herein set forth.

144,816.—Belt-Hole Scupper.—BENJAMIN L. WOOD, Taunton, Mass. Application filed July 5, 1873.

The casing has spurs or pins cast centrally upon each side thereof, upon which the shipping-plate moves. The distance that the plate moves is equal to the width of the belt used, and the length of the opening in the top of the casing is equal to twice that width.

Claim.—The revolving belt-hole plate A, used in connection with the casing D, (either upon the exterior or interior thereof,) all for the purpose and in the manner substantially as herein set forth.

144,817.—Compound Engine.—WILLIAM WEIGET, Newburg, N. Y. Application filed August 15, 1873.

A compound engine, having two cylinders and two pistons, is provided with a single induction-valve and suitable ports and passages, so that a volume of steam admitted, on once opening the valve, will effect a complete backward and forward movement of the piston. The single steam-valve is combined with a regulator, so that the volume of steam admitted to the small cylinder is dependent on the pressure of steam.

Claim.—1. A compound engine, having two cylinders and two pistons, provided with a single induction-valve, and with ports and passages, substantially as described, so that a volume of steam, admitted on once opening the said valves, will be the sole agent for effecting a complete backward-and-forward movement of the piston, as specified.

2. The combination, with the single steam-valve *d* of the compound engine, of a regulator, operating as described, so that the volume of steam admitted to the small cylinder is rendered dependent on the pressure of the steam.

144,818.—Frame for Horizontal Engines.—WILLIAM WRIGHT, Newburg, N. Y. Application filed July 26, 1873.

Claim.—1. A horizontal steam-engine frame in which a cylinder, *b*, for guiding the cross-head, is combined with the cylinder-head *a* and semicircular connecting-piece *d*, substantially in the manner described.

2. The combination, in a horizontal engine-frame, of the guiding-cylinder *b*, base H, and trough-like connection D.

3. A horizontal engine-frame composed of the cylinder-head *a*, guiding-cylinder *b*, connecting-piece *d*, trough D, base H, and web *t*, all combined substantially in the manner described.

144,819.—Milk-Boiler.—OSWALD ZWICKER, Philadelphia, Pa., assignor to himself and HENRY OTTO HEHMANN, same place. Application filed August 15, 1873.

A central tube, provided with a perforated base, projects through a perforated cover. The circulation is accelerated from the bottom of the vessel.

Claim.—The combination of the central tube B, its enlarged notched or perforated base, the dished cover D, and its opening *c*, with the pan A, as set forth.

REISSUE PATENTS.

5,656.—Windmill.—EPHRAIM A. ATWOOD and HARRY H. BODWELL, San Francisco, Cal.—Patent No. 142,865, dated September 16, 1873. Application filed November 1, 1873.

The tail or vane of a wind-wheel is hinged to a toothed segment, with which a screw engages to turn and lock the vane at any desired angle, and a shoe, consisting of the body or upright, with the horizontal arm and the brace as a means of supporting and hinging the tail.

Claim.—1. The worm L and the segment K, for the purpose of turning the tail to any position and locking it, substantially as herein described.

2. In combination with the worm L and the segment K, the vertical pulleys M and R and the endless rope O, for the purpose of operating the rudder from the ground, substantially as herein described.

3. In combination with the pulley R and adjusting-spring U, the guide-rod T, to prevent twisting, substantially as herein described.

4. The shoe, consisting of the body or upright H, with the horizontal arm F and brace J, as a means of supporting and hinging the tail G', substantially as described.

5,657.—Tug-Holder.—THOMAS J. BOTTOMLEY, Burlington, Wis., assignor to PRATT & LETCHWORTH, Buffalo, N. Y.—Patent No. 67,489, dated August 6, 1867. Application filed August 18, 1873.

Claim.—1. The combination of two trace carrying arms with a base, A, provided with loops *a a a a*, substantially as hereinbefore set forth.

2. The combination, with the base and tug-supporting arms of a trace-carrier, of the spring locking-arms *s s*, substantially as and for the purpose hereinbefore set forth.

5,658.—Cooler for Coffee.—JABEZ BURNS, New York, N. Y.—Patent No. 61,393, dated January 22, 1867. Application filed October 2, 1873.

Hot roasted coffee is placed upon a perforated false bottom in a movable pan. The compartment below is connected with a suction-fan blower, which causes air to flow down through the coffee and out into the external air, cooling the coffee and removing from the drying-room smoke and dust.

Claim.—1. The movable cooler or pan A, having a perforated bottom for holding the coffee, or substitutes for coffee, to be cooled, in combination with the suction-blower E connected with the cooler, substantially as described, to draw off the smoke and dust from below, as set forth.

2. The stationary suction-blower E, provided with a discharge-pipe, *b*, in combination with the portable cooler A and connecting-tube D, substantially as described, for removing the dust and smoke which rise from the coffee during the operation of cooling, as set forth.

5,659.—Device for Steaming Oil-Wells.—THOMAS B. CABOTHERS, Oil City, Pa.—Patent No. 139,656, dated June 10, 1873. Application filed July 15, 1873.

Clearing clogged fissures and veins in oil-wells by means of steam. The steam-pipe is provided with perforations at its lower part, in consequence of which the steam is directly applied to the sides of the well.

Claim.—1. The pipe D, provided with perforations *a a*, whereby steam may be conveyed and directly applied to clogged veins and fissures of oil-wells, substantially as and for the purpose herein set forth.

2. The steam-pipe D, having perforations *a a*, in combination with the casing-head A, casing B, and tubing C, substantially as and for the purpose shown.

5,660.—Skate.—JOHN FORBES, Halifax, Nova Scotia.—Patent No. 62,649, dated October 8, 1867. Application filed June 23, 1873.

The runner-brackets, and also the transverse clamp-boxes, are punched out of the frame and bent down into place. The runner is secured to the frame by slot-headed studs.

Claim.—1. The bent drops or brackets, formed out of the skate-frame, for supporting the runner, substantially as described and shown.

2. The transverse box or channel, constructed out of the frame by punching out and bending down, substantially as described.

3. The slot-headed bolts, in combination with the heel or toe plates and slotted parts of the runner, substantially as described.

5,661.—Machine for Trimming the Edges of Boot and Shoe Soles.—RICHARD C. LAMBERT, Quincy, Mass., assignor, by mesne assignments, to THE SHOE-MACHINERY MANUFACTURING COMPANY.—Patent No. 80,936, dated August 11, 1868. Application filed November 10, 1873.

Claim.—1. In a machine for trimming, paring, smoothing, or beading the edges of soles of boots and shoes, the combination of a boot or shoe holding mechanism that presents the sole-edge in a substantially vertical plane, and an overhanging tool that rests upon such edge, and is capable of following the curvatures of the sole and sole-edge as such edge is progressively brought under the tool.

2. In combination with the overhanging operating tool, a jack mechanism, having successive longitudinal and semi-rotative movements for bringing the sole-edge to the action of the tool.

3. In combination with the longitudinally and rotatively moving jack mechanism, carrying and supporting the shoe-sole in a vertical plane, a locking mechanism for confining the jack during its rotative movements.

4. In combination with the jack or shoe-holding mechanism, the oblong gear and pinion, arranged in a vertical plane, and operating to impart the respective movements to the jack, substantially as described.

5. In combination with the longitudinally and rotatively moving shoe holding mechanism, the cam-grooved plate *a* for guiding such shoe-holding mechanism, substantially as described.

6. In combination with the longitudinally and rotatively moving shoe-holding mechanism, a tool-holder, having a compound joint to permit its vertical, lateral, and angular movements, substantially as described.

7. In combination with the shoe-holding mechanism, a tool which is held to or toward the sole-edge by the stress of suitable springs.

8. In combination with the shoe-holding mechanism, a pattern-plate, adapted to the sinuosities of the whole sole, for regulating the action of the tool, substantially as described.

9. In combination with the plate *f*, having the outline of a shoe-sole, a clamping mechanism for clamping the shoe against said plate, substantially as described.

5,662.—Eyelet-Making Machine.—WILLIAM R. LANDSTEAR, Hartford, Conn., assignor, by mesne assignments, to THE HARTFORD EYELET COMPANY, same place.—Patent No. 53,669 dated March 6, 1866; antedated October 9, 1865. Application filed April 25, 1873.

The improvement here claimed that was not claimed in the original patent is, the centering-teat *a* on the extremity of the male former B, as specified in 4th claim.

Claim.—1. The combination and arrangement of the die A, the male former B, the punch C, the female former C', the elevator D, and the flanging-die *c*.

2. The combination of the die *d* and the expelling-passage *f* with the female former C', the punch C, the male former B, and the die A, all constructed and arranged substantially as described.

3. The combination and arrangement of the teat or spur *e* with the male former B, the die A, the punch C, and the female former C', all constructed and arranged as described.

4. The combination and arrangement of the annular groove *b*, with the elevator D and the flanging-die *c*.

5,663.—Cotton-Gin.—ROBERT MCKENNA, White's Station, Tenn.—Patent No. 108,500, dated October 18, 1870; reissue No. 5,148, dated November 19, 1872. Application filed November 10, 1873.

Flanged disks, which are arranged on a driven shaft within the roll-box, near the lower edge of the seed-board, mesh into the spaces between the gin-saws, for the purpose of expelling the seed and pressing the lint against the saws.

Claim.—The roller or shaft F with flanged disks G G, combined and arranged in the roll-box to operate in connection with the gin-saws, substantially in the manner and for the purpose herein set forth.

5,664.—Printing-Press.—GEORGE W. PROUTY, Charlestown, Mass.—Patent No. 132,509, dated October 29, 1872. Application filed October 20, 1873.

Segmental gear actuates a semi-rotating plate, which is provided with lugs in which slide the rods carrying the inking-roller frame, and with slotted connecting-rods vibrating the platen.

Claim.—1. The plates H, having the brackets I' and side crank-sockets I, for the connecting of the platen and inking-rollers to the pinion-shaft through the medium of the pitman J and rods N', substantially as described.

2. The combination of the rocker-shaft G, the lever G', the segment F, pinion E, shaft D, cranks I, and pitmen J, operating, as set forth, to impart motion to the platen K, substantially as described.

3. The combination of the segment F, pinion E, shaft D, plate H provided with the brackets I', the rods N', and springs P, operating to impart motion to the inking-rollers M, substantially as described.

4. The toothed segments F, engaging with the pinion E, and operating to transmit motion to the piston and inking-rollers through the medium of the shaft D, crank-plate H, pitmen J, and rods K, or their equivalents, substantially as specified.

5,665.—Locomotive-Wheel.—JOHN R. RICHARDSON, Max Meadows, Va.—Patent No. 105,506, dated July 19, 1870; reissue No. 4,721, dated January 23, 1872. Application filed September 12, 1873.

Claim.—The spurs b, springs d, and pins e on a locomotive-wheel, in combination with a track, a, having teeth c, substantially as set forth.

5,666.—Salt and Pepper Dredge.—DANIEL C. RIPLEY, Pittsburg, Pa.—Patent No. 142,351, dated September 2, 1873. Application filed October 13, 1873.

Two vessels, one within the other, having discharge-openings at the same end, and a rotating registering-cap.

Claim.—1. A dredge having two compartments with the discharge-openings at one and the same end, as described.

2. The combination, in a dredge, of two compartments with a rotating registering-cap, substantially as described.

3. A dredge having separate compartments a and d and two caps, e and f, one of which has a slight rotary motion, and both having perforations arranged relatively to each other, as described, so that, by the rotation of the cap f', either compartment may be opened while the other is closed, substantially as set forth, and for the purposes specified.

INDEX OF INVENTIONS PATENTED NOV. 18, 1873.

	Class No.	Whole No.
Alarm, overflow, T. Mayes	148	144,687
Bag fastener, S. R. Bush	57	144,738
Bale tie clamp, T. D. Leonard	7	144,776
Bale tie, cotton, F. Quarles	7	144,793
Barrel heads, making, J. L. Kilgore	40	144,771
Barrel making machinery, C. Ruggles	40	144,635
Bed bottom, S. B. Freeman	62	144,754
Bed bottom, spring, W. C. McGill	62	144,688
Bee hive, J. R. East	9	144,750
Belt hole scupper, B. L. Wood	87	144,816
Billiard table, S. H. Waldie	143	144,716
Blackboard rubber, P. B. Horton	146	144,674
Boats, propelling, Black and Jones	139	144,732
Boiler, milk, O. Zwicker	98	144,819
Boiler, steam, G. G. Lobdell	148	144,778
Boiler, wash, W. H. Hammond	91	144,761
Boiler, wash, R. Lawyer	91	144,774
Boiler, wash, W. Reinemer	91	144,795
Boilers, water gage for, C. G. and B. M. Martin	148	144,686
Bolting machine, H. Cabanes	57	144,739
Boot and shoe soles, machine for trimming the edges of, R. C. Lambert, (reissue)	16	5,661
Bottle stopper, H. S. Lesher	1	144,777
Box, paper, E. M. Slayton	109	144,800
Brick, method of burning, T. Billesbach	20	144,652
Bridge girder, J. W. Evans	21	144,751
Bridge, iron, P. Johnson	21	144,766
Bronzing machine, Chaput and Braidwood	54	144,741
Brush, fly, A. A. Lyle	23	144,779
Butter worker, D. W. Dake	45	144,662
Can, measuring, Tice and Smalley	139	144,713
Car brake, M. Karg	122	144,691
Car brake, J. B. Felton	122	144,767
Car coupling, W. A. Cochran	122	144,658
Car coupling, A. Langellier	122	144,694
Car, dumping, L. C. Brady	121	144,654
Car spring, E. T. Bussell	122	144,600
Car, stock, O. Severance	121	144,798
Cars, safety platform for railway, R. Strode	122	144,804
Carriage top, J. N. Gill	31	144,812
Carriage top, H. Seyler	31	144,704
Cartridge holding vent, sportsman's, J. H. Black	38	144,594
Carving machine, H. Cottrell	173	144,745
Case, numerical filing, G. W. Bettesworth	146	144,593
Chair, tilting, J. Enger	62	144,603
Churn, J. P. Friend	45	144,755
Clasp, corset, J. P. MacLean	89	144,629
Clothes wringer, T. E. McDonald	91	144,627
Clothes wringer, J. Seaman	91	144,705
Cock, automatic lubricating water and gas, E. P. Brooks	167	144,735
Cock, stop, Redier and Bates	167	144,700
Coffee cooler, J. Byrne, (reissue)	89	5,658
Coffin, sheet metal, Farrington, Jr., and Austin	39	144,604
Collar and cuff, E. P. Furlong	39	144,611
Corn husking machine, L. A. Aspinwall	89	144,590
Corset clasp, J. P. MacLean	89	144,628
Cotton gin, N. W. Geddy	41	144,663
Cotton gin, E. McKenna, (reissue)	41	5,663
Cultivator, R. S. Cavett	43	144,740
Cylinder and piston valve, steam, Picking and Hopkins	150	144,788
Desk, &c., writing, D. Schafer	146	144,636
Door securer and key ring, combined, J. P. Tuck	24	144,643
Dough, machine for sheeting, O. B. Fuller	6	144,666
Eaves trough, P. F. Kiblinger	30	144,770
Embalming human bodies, fluid compound for, W. E. Chenoweth	39	144,609
Engine, compound, W. Wright	150	144,817
Engine, rotary, P. Worrall	150	144,792
Engines, frame for horizontal, W. Wright	150	144,818
Engines, mechanism for reversing, G. W. Bishop	67	144,731
Engines, relief valve for steam fire, W. Jeffers	150	144,765
Excavator, D. Judd	51	144,679
Eyelet making machinery, W. R. Landfear, (reissue)	23	5,662
Fabrics, machine for disintegrating, M. Marshall	76	144,685
Feather duster, C. L. W. Baker	98	144,728
Fence, portable, B. L. Taylor	58	144,641
Fire arm, revolving, D. Williamson	123	144,814
Fire arm, revolving, D. Williamson	123	144,815
Fire extinguisher, G. Booth	35	144,595
Fire extinguishing water pipe attachment for buildings, T. Miller	167	144,690
Fire place, W. Heyland	154	144,675
Fire, protecting buildings against, W. McAllister	4	144,625
Fires, distributer for extinguishing, G. J. Orr	118	144,696
Food, preserving fruits and vegetables for, W. G. Barbee	58	144,592
Furnace for evaporating alkaline solutions, &c., M. L. Kees	155	144,682
Furnace of steam boilers, blast for, R. Gigodot	12	144,757
Game table, R. R. Crawford	143	144,650
Garment, under, O. P. Flynt	38	144,609
Gas works, sealing dip pipe of, E. Jones	67	144,619
Gate, G. W. and G. S. Mackey	52	144,780
Generator, carbonic acid gas, F. W. Wiesebrock	1	144,719
Glass blowers, chimney tool for, J. G. Mustin	68	144,628
Glove, T. G. Foster	38	144,665
Grain distributer, rotary, A. D. Foote	79	144,753
Grain drier, A. Soper	48	144,710
Gum, compound vulcanizable, D. M. Lamb	84	144,622
Gums and caoutchouc, treating vulcanizable, D. M. Lamb	84	144,623
Hammer, revolving, G. Stacy	60	144,638
Harness saddle, A. Gilliam	72	144,613
Harvester, binder's attachment for, H. Porter	74	144,789
Harvester, binder's attachment for, T. Urdahl	74	144,715
Harvester, cotton, W. H. Pedrick	41	144,629
Harvester rake, E. Lippoldt	74	144,683
Heating apparatus, W. C. Baker	147	144,650
Hinge for safe and vault doors, H. Gross	24	144,669
Horses, heel boot for, W. Mathis	60	144,782
Hub boring machine, F. Jonas	31	144,618
Hydrocarbons, Apparatus for burning, C. H. Cushing	149	144,660
Ice houses, A. Wilbur	58	144,720
Ingot mold for gold or silver, J. Feix	33	144,605
Inking apparatus, L. Hart	117	144,673
Insulating and finishing compound for conducting wires, Reed and Phillips	50	144,794
Ironing machine, G. W. Cottingham	91	144,743
Kneading board, H. P. Jones	88	144,768
Knife, hay, J. S. Ball	44	144,591
Knobs to drawers, &c., attaching, S. A. Brackett	24	144,597
Liquids, apparatus for drawing effervescent, T. Warker	1	144,809
Lithographic printing form, I. Reynolds	54	144,796
Lock, permutation, H. Gross	93	144,670
Locomotive wheel, J. R. Richardson, (reissue)	94	5,665
Loom, narrow ware, R. B. Fowler	95	144,610.
Loom shuttle, N. D. Chapman	95	144,657
Loom temple, Allen and Stimpson	95	144,647
Looms, take up mechanism for, C. Gabren	95	144,756
Mangle, E. Gundlach	91	144,671
Match safe, J. and A. Helm	70	144,606
Measure, hatter's head, F. A. Fenton	76	144,666
Meter, fluid, H. A. Desper	167	144,747
Middlings bolt, A. G. and H. W. Mowbray	57	144,783
Mill, guide for rolling, C. H. Perkins	125	144,632
Mill, guide for rolling, C. H. Perkins	125	144,633
Mill, paint, R. Byrne	107	144,656
Mill, rolling, C. H. Perkins	125	144,631
Miner's pick, R. K. Walton	124	144,808
Mower, lawn, W. Allen	75	144,725
Mug, shaving, Furr and Knaus	161	144,667
Mustache shield for drinking cups, J. J. Greenough	161	144,614
Net, portable fly and mosquito, T. M. Prentiss	62	144,792
Nippers, &c., cutting, P. Broadbooks	100	144,734
Oils, apparatus for purifying and filtering, D. M. Lamb	96	144,621
Ore stamp feeder, J. Tulloch	3	144,714
Ores, separating precious metals from, S. W. Kirk	3	144,772
Organ action, reed, W. N. Manning	108	144,781
Overshoe, G. Washineon	16	144,810
Pantaloons stretcher, J. D. Ryan	38	144,703
Pantaloons, steaming and drying apparatus for shaping, E. B. Vicks	38	144,644
Paper and card board to fix marks by metallic pencils, treating, H. M. Johnston	108	144,678
Paper holder shelf, G. V. Hawkins	146	144,763
Pavement, W. H. De Valin	110	144,748
Pavements, treating brick for, W. H. De Valin	110	144,749
Photographic negatives, process of retouching, D. H. Wright	111	144,723
Picture frame, J. A. Burch	54	144,599
Picture frame and exhibiter, combined, B. Anyan	54	144,648
Pipe joint, J. Demarest	167	144,653
Planter, corn, L. Sipe	133	144,708
Planter, corn, A. Springsteen	133	144,711
Planter, cotton, C. H. Nixon	133	144,784
Planter, cotton seed, D. P. Ferguson	133	144,607
Planter, hand corn, E. Rogers	133	144,791
Plow, R. Bourne	114	144,653
Plow, J. S. Hall	114	144,760
Plow, J. Oliver	114	144,785

	Class No.	Whole No.
Plow, Shipp, Peterson, and McLurd	114	144,787
Plow, draft attachment for, N. Westcott	114	144,811
Plug and faucet connection, tap, J. F. Kane	167	144,689
Pocket attachment, safety, R. L. Russell	98	144,702
Polishing tool, H. Cottrell	153	144,744
Postal card, H. M. Johnston	146	144,677
Press, cotton, T. D. Leonard	7	144,775
Press, hay, H. F. Blank	7	144,733
Printing press, G. W. Prouty, (reissue)	117	5,664
Printing press, rotary, C. C. Child	117	144,742
Pumps, stocker rod joint for, A. M. Williams	118	144,813
Purifier, middlings, G. Parker	57	144,697
Rake, L. A. Powers	141	144,701
Register, hot air, W. Highton	147	144,616
Rice, machine for separating, H. B. Stevens	57	144,803
Salt and pepper dredge, D. C. Ripley, (reissue)	98	5,666
Sash fastener, E. Burstow	94	144,655
Sawing machine, band, Roche and Orton	120	144,797
Scraper, road, J. W. Weston	51	144,717
Screw blanks, machine for nicking and shaving, Nugent and Fanning	171	144,693
Seaming machine, A. S. Munger	126	144,691
Sewing machine hemmer, W. L. Apthorp	134	144,649
Sewing machine hemmer, Bryant and McGaw	134	144,736
Sewing machine hemmer, L. Seymour	134	144,706
Sewing machines, button hole stitching attachment for, Hansen and Harley	134	144,672
Shoe blacking, J. L. Sneed	16	144,801
Skate, J. Forbes, (reissue)	143	5,660
Skate, J. A. Whelpley	143	144,718
Skirt protector, J. Jenkinson	38	144,617
Slate and blackboard rubber, H. W. Holly	146	144,764
Sleigh, A. D. De Lano	31	144,746
Soda water draft tube, O. Zwietusch	1	144,646
Spark arrester and conductor, E. Shoemaker	94	144,637
Spinning machine spindle, W. T. Carroll	142	144,691
Spinning rings, process of repairing, H. L. Pierce	142	144,630
Spool case, A. W. Harper	38	144,768
Spring for chairs, &c., W. T. Doremus	62	144,654
Stair rod fastener, W. B. Goold	24	144,756
Stair rod fastener, W. B. Gould	24	144,759
Stilts, T. J. Sheears	143	144,799
Stone cutter, G. Stacy	153	144,640
Stone cutter's and other tools, mode of fastening cutters in, G. Stacy	153	144,639
Stool or chair, revolving, J. J. Vollrath	62	144,806
Stove damper, H. H. Huntley	154	144,676
Stove pipe damper, J. M. Read	154	144,634
Stud and button, F. E. Brown	23	144,596
Sugar draining machine, centrifugal, C. Fischer	155	144,758
Syringe and pump, J. Speak	118	144,802
Syringe, hypodermic, E. Cutter	156	144,661
Table and secret writing desk, combined, C. Kade	62	144,769
Tackle block, chain, S. D. Backus	67	144,727
Tacks, nails, and screws to prevent corrosion and to color them, coating, G. Starks	103	144,712
Tea kettle, N. Plympton	88	144,698
Teeth, method of fastening artificial, G. F. C. Reese	46	144,699
Telegraph apparatus for automatic signaling, Unger and Towle	50	144,643
Telegraph key, Billings and Stockly	50	144,730
Telegraph, unison stop for printing, C. J. Wiley	50	144,812
Thrashing machine, J. M. Wilders	150	144,781
Tire tightener, Bellairs and Ough	31	144,729
Toy gymnast, F. A. Bancker	143	144,651
Toy propeller, G. W. Jones	143	144,767
Track clearer, E. Abbiati	128	144,784
Trimming, W. Walker	38	144,807
Tug holder, T. J. Bottomley, (reissue)	72	5,657
Tuyeres, manufacture of bessemer steel converter, J. E. Atwood	85	144,738
Valve, C. F. Murdock	154	144,692
Vegetable cutter, J. Kraus	59	144,773
Vegetable cutter, J. R. Wharry	59	144,645
Vegetable slicer, N. Botsford	59	144,596
Vehicles, seat for, U. C. Snyder	31	144,709
Vehicles, shifting top for, H. K. Porter	31	144,790
Wagon axle skeins, clip for, J. M. Orput	31	144,695
Wagon, dumping, W. Fields	31	144,608
Wagons, draw bar in draft equalizers for, J. M. Orput	31	144,694
Warp threads, rod for drawing in, M. S. Jordan	95	144,620
Washing machine, J. Trickett	91	144,805
Water from mines, purifying, H. Burgess	35	144,737
Wells, device for steaming oil, T. B. Carothers, (reissue)	124	5,659
Whiffletree, J. Parker	31	144,795
Windmill, Atwood and Bodwell, (reissue)	118	5,656
Window fastening, storm, A. J. Lovejoy	24	144,684
Wood joining, R. McChesney	54	144,686

INDEX OF PATENTEES TO WHOM PATENTS WERE GRANTED NOV. 18, 1873.

Abbiati, E., Track clearer	144,784
Albert Field Tack Company, The, assignees	144,712
Allen, N. L., and E. S. Stimpson, Loom temple	144,647
Allen, W., Lawn mower	144,725
Anyan, B., Combined picture frame and exhibiter	144,648
Apthorp, W. L., Hemmer for sewing machines	144,649
Aspinwall, L. A., Corn husking machine	144,590
Atwood, E. A., and H. H. Bodwell, Windmill, (reissue)	5,656
Atwood, J. E., Manufacture of bessemer steel converter tuyeres	144,738
Austin and Farrington, Jr.	144,604
Backus, S. D., Chain tackle block	144,727
Baker, C. L. W., Feather duster	144,728
Baker, W. C., Heating apparatus	144,650
Ball, J. S., Hay knife	144,591
Bancker, F. A., Toy gymnast	144,651
Barbee, W. G., Preserving fruits and vegetables for food	144,592
Bates and Rodier	144,709
Beelman, J. H., assignee	144,709
Bellairs, W., and W. Ough, Tire tightener	144,729
Bettesworth, G. W., Numerical filing case	144,593
Billesbach, T., Method of burning brick	144,652
Billings, C. H., and G. W. Stockly, Telegraph key	144,730
Bishop, G. W., Mechanism for reversing engines	144,731
Black, J., and G. W. Jones, Propelling boats	144,732
Black, J. H., Sportsman's cartridge holding vest	144,594
Blank, H. F., Hay press	144,733
Bodwell and Atwood, (reissue)	5,656
Booth, G., Fire extinguisher	144,595
Botsford, N., Vegetable slicer	144,596
Bottomley, T. J., Tug holder, (reissue)	5,657
Bourne, R., Plow	144,653
Brackett, S. A., Attaching knobs to drawers, &c.	144,597
Brady, L. C., Dumping car	144,654
Braidwood and Chaput	144,741
Broadbooks, P., Cutting nippers, &c.	144,734
Brooks, E. F., Automatic lubricating water and gas cock	144,735
Brown, F. R., Stud and button	144,598
Bryant, S. H., and J. M. and H. L. McGaw, Hemmer for sewing machines	144,736
Burch, J. A., Picture frame	144,599
Burch, J. T., assignee	144,656
Burgess, H., Purifying water from mines	144,737
Burns, J., Cooler for coffee, (reissue)	5,658
Burstow, E., Fastener for meeting rails of sashes	144,655
Bush, S. R., Bag fastener	144,738
Bussell, E. T., Car spring	144,600
Byrne, R., Paint mill	144,656
Cabanes, H., Bolting machine	144,739
Candee and Company, L., assignee	144,710
Carothers, T. B., Device for steaming oil wells, (reissue)	5,659
Carroll, W. T., Spindle for spinning machines	144,691
Cavett, R. S., Cultivator	144,740
Chapman, N. D., Loom shuttle	144,657
Chaput, L. G., and W. and J. Braidwood, Bronzing machine	144,741
Chenoweth, W. E., Fluid compound for embalming human bodies	144,609
Child, C. C., Rotary printing press	144,742
Christoffel, J. B., assignee	144,706
Cochran, W. A., Car coupling	144,658
Comstock, Castle, and Company, assignees	144,676
Cook, S. S., assignee	144,601
Cottingham, G. W., Ironing machine	144,743
Cottrell, H., Carving machine	144,745
Cottrell, H., Polishing tool	144,744
Cottrell Stone Machinery Company, assignees	144,744, 144,745
Covell, E. T., assignee	144,601
Crawford, R. R., Game table	144,659
Cross, D., assignee	144,811
Cushing, C. H., Apparatus for burning hydrocarbons	144,660
Cutter, E., Hypodermic syringe	144,661
Dake, D. W., Butter worker	144,662
De Lano, A. D., Sleigh	144,746
Demarest, J., Pipe joint	144,653
Desper, H. A., Fluid meter	144,747
De Valin, W. H., Pavement	144,748
De Valin, W. H., Treating brick for pavements	144,749
Doremus, W. T., Spring for chairs, &c.	144,654
Drury, E. C., assignee	144,775, 144,776
Duncan, C. H., assignee	144,813
East, J. R., Bee hive	144,750
Eastham, G. W., assignee	144,708
Enger, J., Tilting chair	144,603
Evans, J. W., Girder for bridges	144,751
Fanning and Nugent	144,693
Farrington, J. D., Jr., and T. P. Austin, Sheet metal coffin	144,604
Feix, J., Ingot mold for gold or silver	144,605
Fenton, F. A., Hatter's head measure	144,606
Ferguson, D. P., Cotton seed planter	144,607
Fields, W., Dumping wagon	144,608
Fischer, C., Centrifugal sugar draining machine	144,758
Flynt, O. P., Under garment	144,609
Foote, A. D., Rotary grain distributer	144,753
Forbes, J., Skate, (reissue)	5,660
Foster, T. G., Glove	144,665
Fowler, R. B., Narrow ware loom	144,610
Freeman, S. B., Bed bottom	144,754
Friend, J. P., Churn	144,755
Fuller, O. B., Machine for sheeting dough	144,666
Furlong, E. P., Collar and cuff	144,611
Furr, A. J., and W. C. Knaus, Shaving mug	144,667
Geddy, N. W., Cotton gin	144,663
Gabren, C., Take up mechanism for looms	144,756
Gigodet, R., Blast for furnaces of steam boilers	144,757
Gill, J. M., Carriage top	144,812
Gilliam, A., Harness saddle	144,613
Gould, W. B., Stair rod fastener	144,758
Gould, W. B., Stair rod fastener	144,759
Greenough, J. J., Mustache shield for drinking cups	144,614
Gross, H., Hinge for safe and vault doors	144,669

Gross, H., Permutation lock 144,670
Gundlach, R., Mangle 144,671
Guthrie, S., assignee 144,660
Haber, M., assignee 144,661
Hall, J. S., Plow 144,760
Hall's Safe and Lock Company, assignee 144,660, 144,670
Hanawood, W. H., Wash boiler 144,761
Hansen, C. A., and G. Harley, Button hole stitching attachment for sewing machines 144,672
Harley and Hansen 144,672
Harper, A. W., Spool case 144,762
Hart, I., Inking apparatus 144 673
Hart, J., assignee 144,728
Hartford Eyelet Company, The, assignee, (reissue) 5,662
Hawkins, G. V., Paper holder shelf 144 763
Helm, J. and A., Match safe 144,615
Helmer, A. M., assignee 144,753
Hermann, H. O., assignee 144,819
Highton, W., Hot air register 144,616
Holly, H. W., Rubber for slates and blackboards 144,764
Hopkins and Pinking 144,726
Horton, P. B., Blackboard rubber 144,674
Heyland, W., Fire place 144,675
Hubbs, J. A., assignee 144,726
Huntley, H. H., Stove damper 144,676
Jackson, T. M., assignee 144,717
Jaffurs, W., Relief valve for steam fire engines 144,765
Jenkinson, J., Skirt protector 144,617
Jocelyn, L. A., assignee 144,764
Johnson, J. D., assignee 144,775, 144,776
Johnson, P., Iron bridge 144,766
Johnston, H. M., Postal card 144,617
Johnston, H. M., Treating paper and card board to fix marks by metallic pencils 144,678
Jones, F., Hub boring machine 144 618
Jones and Black 144,732
Jones, E., Sealing dip pipes of gas works 144,619
Jones, G. W., Toy propeller 144,767
Jones, H. F., Kneading board 144,768

OFFICIAL GAZETTE

OF THE

United States Patent Office.

VOL. 4.—NO. 22. TUESDAY, NOVEMBER 25, 1873. PRICE { $5,00 per year—single. { $5,00 per year in clubs.

The OFFICIAL GAZETTE is published on Tuesday of each week, from the United States Patent Office. The subscription price for 1873 is six dollars per year for single subscribers; five dollars per year to clubs of not less than five sent at one time, and which will be mailed free of postage to separate addresses if desired. Subscriptions will commence and terminate with the year. All orders should be addressed to the Commissioner of Patents, Washington, D. C.

UNITED STATES PATENT OFFICE,

Washington, D. C., December 5, 1873.

Ordered, Rule of Practice No. 22, U. S. Patent Office, referring to the requirement of new drawings in certain cases, in applications for reissue, is hereby amended as follows:

After this date all reissue applications must be accompanied by new thick-paper drawings, as in original applications.

M. D. LEGGETT,
Commissioner.

DIGEST OF FOREIGN PATENT LAWS.

VENEZUELA.

REPORT BY MR. WILL. ACKERS CAGE, OF THE BRITISH LEGATION.

Any person, the author of a discovery or invention in matters of industry, or of an improvement not before used or known, or who introduces from abroad any kind of manufacturing process or industrial improvement known in other countries, but not in use in Venezuela, can obtain a patent or industrial privilege.

To obtain the patent above alluded to a petition must be addressed direct to the minister of the interior, stating, in a clear and precise manner, the principal and essential points of the discovery, invention, or improvement, accompanied by so complete, clear, and correct a description that any one acquainted with the art could obtain the result or manufacture the article if employing the means of proceeding in the manner indicated.

Provisional declarations unaccompanied by the above-mentioned description are not taken into consideration.

On the petition having been presented, the day and hour of its having been made are noted on the margin, in order to insure to the petitioner the priority of the discovery or invention.

Should the patent be in dispute between the persons, the first who had applied for it is entitled to it; and if both applications were made the same day and hour, the question is decided by arbitrators, one named by each interested party and another by the minister of the interior. Should one of the interested parties refuse to name an arbitrator, the patent is issued to the other; and should there be more than two contending parties, and these should not agree in the nomination of three arbitrators, the nomination is then made by the minister of the interior.

In the case of death of an inventor before obtaining a patent for his invention, his lawful heirs may obtain it in conformity with law.

The petitioner for a patent has to make oath to the effect that he believes himself to be the true inventor of the art, machinery, &c., with reference to which he applies for a patent.

The patent is issued by the president of the republic, and in it is mentioned the name of the inventor, and that he has made oath according to law; the art or machine, &c., invented, (fully described as above stated,) and the number of years during which he is allowed the exclusive right to exercise the industry, or manufacture the machine, or sell the article invented; the government, however, not guaranteeing the priority or merits of the invention.

The patent for a discovery, invention, or improvement, insures to the author the exclusive right to exercise the industry, or manufacture the machine, or sell what he invented, for the number of years stated in the patent, in all the states of the republic; but in the case of the introducing of some kind of industrial invention or improvement from abroad, known in other countries, but not in use in Venezuela, an exception is made with regard to such states of the republic where such invention or improvement may have been known and in use before the patent was issued.

The owner of a patent may make such establishments or shops as may be required for the working of the pat-

ent; may employ all sorts of workmen; have partners; establish everywhere deposits for the sale of the productions of his patent, and he may freely dispose of his secret and patent and transfer it to others in legal form, although the person to whom it may be transferred, under the penalty of losing the right, is bound to inform the minister of the interior of the transfer.

A patent issued for an improvement of an invention already patented is limited to its special object, according to the distinctive points indicated in the description, and confers no right to any part of the invention that may have been the subject of a prior patent or of a process previously known; but the owner of the prior patent cannot either avail himself of the improvement or the subject of the later patent without coming to an understanding with its owner.

No privileged industry can, according to law, be subjected to any national or municipal contribution or tax exceeding one per cent. per annum on the original cost of the edifice with all its machinery; and so soon as fabrication is in activity the interested party must present to the minister of the interior the documents proving the said cost, and the definitive amount is to be advertised in the gazette of Venezuela.

Primary materials required for a patented industry are exempt from all import duties for the whole period for which the patent has been granted; and, in order to avoid abuses, the patentee must inform the government, on commencing to work his patent, of the primary materials he proposes importing, and the government issues the necessary orders to the customs; and if it be proved that the patentee, abusing the exemption, has introduced such materials for sale without applying them to the patented industry, independently of his having to pay the duties for the materials sold as above stated, he loses for the future the right to the exemption from duties.

Any violation or sale of an article of the patent of invention, without the consent of the owner, is forbidden as an attack upon his prerogative, and entitles him to obtain the intervention of the police to put a stop immediately to any ulterior violation and to provisionally embargo the falsified articles, be they in the hands of the manufacturer himself, or in the hands of any one commissioned to sell them, or be they imported from abroad, and all under penalties established by law.

The utmost duration of the exclusive rights of the patent is fifteen years, and the least is six years, to count from the date on which the patent was issued; but as regards the prohibition to sell articles of the kind of the patented industry, the term of years is to be reckoned from the date on which the patented industry is brought into operation.

In order to facilitate the trying of experiments, patents may be issued for a less time than fifteen years; and if application be made before the lesser term be completed, it is extended to the fifteen years; but if the application be not made the patent ceases.

Every one is at liberty to make use of the invention, discovery, or improvement when the term of a patent ceases, as well as whenever the inventor, discoverer, improver, or importer ceases to be considered to be the owner of the patent, which happens under the following circumstances:

When it is proved that, by adding or suppressing part of the description he is required to furnish, the patentee conceals the true means for the working of his patent.

When it is proved that he employs secret means, not comprised in the description he is required to furnish, and which he did not add to it by any subsequent declaration.

When it is proved that he applied for and obtained a patent for more than there was in reality of discovery, invention, improvement, or to be imported.

When it is proved, with respect to discoveries, inventions, or improvements, that they had been in use before in Venezuela or elsewhere, or are described in some work previously published, the description being sufficiently clear and precise to enable any one acquainted with the art to carry out the invention; and, with respect to those introduced from abroad, that they had already obtained a patent in Venezuela. Also, when it is proved that the patentee has failed, in the former case, within the term of two years, and, in the latter case, within that of one year, to carry the invention into effect.

When the inventor, within six months of his invention having been freely made use of, has not applied for a patent.

When the patent has been obtained through usurpation of the discovery or invention of another person.

When the patent has been transferred to another person, and this person has not notified the transfer to the minister of the interior.

The above points must be proved in a regular suit at law, and if proved the patent is annulled.

A register for patents issued, with other information relating to them is, according to law, to be kept at the department of the interior.

On a patent being issued, the circumstance is, according to law, to be published in the gazette of Venezuela.

When the term of a patent lapses, or when a patent is annulled, a circumstantial description of the invention is, according to law, to be published in the gazette of Venezuela.

The violation of a patent is punishable, according to law, by a penalty of from three months' to two years' imprisonment, and a fine of from 50 to 500 pesos, say $50 to $500.

Law and practice with regard to inventions correspond, with very slight exceptions, in Venezuela—these exceptions being principally such as arise from the non-publication of the gazette of Venezuela during certain periods, and irregularities and deficiencies in the register, which are principally to be attributed to the civil warfare so constantly prevailing in the country.

For the same reason, probably, there has scarcely been any invention in Venezuela.

COMMISSIONER'S DECISIONS.

EDWARD PAUL AND SAMUEL T. DORLAND.—*Interference.*

[*Appeal from the decision of the Board of Examiners-in-Chief in the matter of the interference between the application of Edward Paul and the patent of Samuel T. Dorland, for* IMPROVEMENT IN ORE-WASHERS.—*Decided November* 12, 1873.]

In an interference between a patent and a subsequent application, the patent affords a *prima-facie* presumption of priority of invention in favor of the patentee.

THACHER, *Acting Commissioner:*

The invention in dispute consists in certain improvements in ore-washing appliances. It is comprehended in the patent of Dorland, and the first and second claims of Paul, which are as follows:

1. The perforated grate or screen *e* at the lower end of the inclined trough *b*, in combination with the inclined grate A, substantially as set forth.
2. The curved end *f*, to the trough *b*, in combination with the inclined grates A, as set forth.

The question in the case is in reality not which of the parties *first* made the invention, but which of them *made* it. It is not possible to hold upon the proof that they are both independent inventors. They were intimately associated at the time the invention was produced, if not with respect to its actual production, at least with respect to the work of overcoming the difficulty it was designed to obviate, and each claims to have made the invention for the same object, at the same time and place, and denies that the other, as an inventor, had any part in it. Paul was superintendent of the Sylvan Lake ore mines, where Dorland was employed under him as a carpenter. In July, 1872, Paul says he discovered that there was a waste of ore in the process of washing, which he immediately sought to prevent. This was a matter that would seem to come legitimately within his province as superintendent, and would not seem likely to concern Dorland or enlist his efforts to devise a remedy. Nevertheless, it is not impossible that Dorland might have observed this waste and called Paul's attention to it; and he swears he did so. The divergence in the opposing testimony begins here and continues throughout with respect to all important particulars.

The specific difficulty to be remedied was that the water, flowing from the main separating-machines, carried off in its current small fragments of ore. To prevent this, Paul, as both parties agree, first placed a box, with a perpendicular grate in its end, under the end of the water-trough. This proved ineffectual, and he alleges that he then gave Dorland directions to make and apply a trough with cast-iron grates in a portion of its bottom near its discharge-end. Dorland claims this to have been his own suggestion, which, as an experiment, he was permitted by Paul to try; but it also proved abortive. Dorland then constructed the devices embodying the invention under consideration, but whether upon suggestions and under specific directions of Paul, or upon his own contriving, and by mere permission and encouragement of Paul, is the vital point in dispute.

Very little light is thrown upon this question by the testimony of the witnesses called to aid the respective parties. Paul certainly obtains little substantial support from those he has produced. The only tolerably safe solution of the case seems to be found in an examination and comparison of the testimony of the parties themselves respecting the particulars and circumstances of the production of the invention. Paul is not entirely clear and full in his account of what he did. He does not set out definitely and specifically the nature, time, place, and circumstances of his alleged directions to Dorland to make the device, and does not relate the manner, incidents, and progress of its conception in his own mind in a manner to assure belief that he is the inventor, where the fact is contested as it is here.

Dorland, on the other hand, as the Board have justly remarked, describes minutely "the construction step by step, the difficulties encountered, and the experiments made, with a naturalness of sequence and detail which gives the impression of his having gone through not only the manual but the mental operation of producing the invention."

Upon careful examination, I find nothing to rely on in the case more justly decisive than a comparison of the character of the testimony of the principals, and, upon such a comparison, I have no hesitation in affirming the decision of the Board, awarding priority of invention to the patentee, in whose favor, as has long been established, the patent itself furnishes a *prima-facie* presumption.

DECISIONS OF THE COURTS.

U. S. CIRCUIT COURT—DISTRICT OF MASSACHUSETTS.

THE SINGER MANUFACTURING CO. *vs.* THE UNION BUTTON-HOLE AND EMBROIDERY CO. *et al.*

[*In equity.—Before Lowell, Judge.—Decided September* 12, 1873.]

MOTION FOR INJUNCTION.

Although courts of equity will not ordinarily, even where the title is clear, disturb the existing order of things by an injunction, they will interfere to preserve them in that condition until the rights of the parties are ascertained, notwithstanding some doubts may rest upon them, provided they are in the course of being judicially determined.

While the courts will not enjoin the specific performance of a contract when they can exercise no supervision over it, or when it would force upon an employer a servant personally objectionable to him, they will nevertheless restrain the parties from any action infringing the contract.

An injunction against trespassing upon an exclusive license to sell a patented article may be granted against parties who are not bound by the contract or who have no notice of it.

Where one party to a contract has already received a benefit from the performance of it by the other, he will be restrained from violating it, although the other is not bound by it.

Where a corporate body had given the plaintiffs an exclusive license to sell machines embodying inventions of which it held the patents, and had agreed to furnish the machines at a stipulated price, it was prohibited from taking measures to dissolve its organization, and its assignee of the patents in trust for a new association was prohibited from disposing of them.

But the corporation was not decreed to perform the contract. *Marble Co.* vs. *Ripley*, 10 Wall., 339, commented on.

[*Elias Merwin*, for complainant.

H. G. Parker and *E. S. Mansfield*, for defendants.]

STATEMENT.

The bill alleged that, in 1866, the defendant company was the owner of certain patents embodied in a machine for making button-holes, and owned a factory, &c., for making the machines, and, being desirous to bring the same into notice and to secure a market, they made a contract with the plaintiffs, who were a corporation of established reputation and large business in this country and in foreign countries, by which the plaintiffs were to be the sole and exclusive agents for the sale of these machines, excepting in France and in the city of Boston, and were to supply the market and to

use certain means and facilities at their command for this purpose; and the defendant company were to furnish the plaintiffs with machines as called for up to the full capacity of the factory, at a certain agreed price, to be paid monthly in cash. It further charged that the plaintiffs had bought and paid for one thousand machines, and had succeeded, with much labor and expense, exceeding the profit obtained, in selling these machines, and that a market had been made mainly, if not wholly, by their exertions; that the company now neglected and refused to deliver any more machines, though requested, and were taking measures to dissolve their association for the purpose of avoiding their contract with the plaintiffs, and in pursuance of that intent they had conveyed their patents to the defendant Wood, as trustee for a voluntary and unincorporated body of persons unknown, called the Button-Hole Sewing-Machine Company; that said Wood had been the treasurer of the defendant company, and was fully informed of the plaintiff's rights.

The bill prayed a decree for specific performance and an injunction against the transfer of the patents by Wood and against the dissolution of the defendant company and the manufacture and sale of the machines, excepting in conformity with the contract.

The agreement between the plaintiff and defendant companies contained this clause: "That the agency aforesaid shall continue so long as the patent or patents for said machine have been or may be granted or extended, provided that the Singer Manufacturing Company shall fairly and reasonably conduct such agency, and shall continue to supply the market with machines as aforesaid, and shall not engage in selling any other button-hole machines than those manufactured by the Union Button-Hole and Embroidery-Machine Company; but in case the Singer Manufacturing Company shall fail to carry out their agreements as herein expressed, the forfeiture of such agency shall be considered the only penalty for such failure.

[*H. G. Parker* and *H. S. Mansfield*, for the defendants.]

The contract is not one that the court can enforce from the nature of the business. *Garret* vs. *Epsom Downs Railway Co.*, 11 Jurist. N. S., 591; *Munroe* vs. *Wirebo R. R. Co.*, 13 W. R., 880. At all events, it will not be enforced, because it is without mutuality. *Guger* vs. *Green*, 4 Gill., 472; *Duvall* vs. *Myers*, 2 Md. Ch., 401; *Bronson* vs. *Cahill*, 4 McLean, 19; *Benedict* vs. *Lynch*, 1 Johns. Ch., 373; *Rogers* vs. *Sanders*, 4 Me., 92; *Woodward* vs. *Harris*, 2 Barb., 439; *Philips* vs. *Berger*, 8 Barb., 527; *Marble Co.* vs. *Ripley*, 10 Wallace, 339.

LOWELL, *J.*:

There is no dispute that the two companies, plaintiff and defendant, made the contract A annexed to the bill, and by which the former is to have the exclusive right of selling the patented machines, excepting two excepted localities; that the defendant Wood had full knowledge of the contract, and that the defendants are about to carry out a course of action which will have a strong tendency, to say the least, to defeat the contract. In such a state of things a court of equity readily grants an injunction until the merits of the case can be inquired into, because, if it refuses to interfere at first, rights may be acquired and innocent third persons may become interested in the property in a way that will embarrass the final action of the court, and perhaps work injustice to those innocent persons. It is the direct opposite of a case in which the court is asked to interfere with existing rights upon the strength of some supposed paramount title, and to break up an established order of things. Here the defendants are breaking the established order, and are the actors in fact, and the court is asked to keep things as they are and were agreed to be, until the full evidence is taken. "It is certain," said a learned lord chancellor, speaking of a case of this kind, "that the court will in many cases interfere and preserve property *in statu quo* during the pendency of a suit in which the rights to it are to be decided, and that without expressing and often without having the means to form any opinion as to such rights." He then cites several authorities, and continues: "It is true that the court will not so interfere if it thinks there is no real question between the parties; but, seeing there is a substantial question to be decided, it will preserve the property until the question can be disposed of. In order to support an injunction for such a purpose, it is not necessary for the court to decide upon the merits in favor of the plaintiff." *The Great Western Railway Co.* vs. *The Birmingham Railway Co.*, 2 Phillips, 602.

The decision of this motion, then, depends upon whether the plaintiffs have made such a reasonable *prima-facie* case for the relief, or some substantial part of the relief which they seek, that they are fairly entitled to maintain the *status quo*. Upon the matters of fact I find that they have such a case.

The two points of law are not without difficulty. The relief asked is specific performance and injunction. It is argued with great ability by the defendants that the plaintiffs are not entitled to specific performance, and that, therefore, they cannot have an injunction, which is merely auxiliary. Granting the premises, I am not prepared to concede the conclusion. If the court cannot order a contract for the making of button-hole machines to be specifically performed by reason of the impossibility of superintending the details of such a business, it does not follow that the bill may not be retained as an injunction bill. It was formerly thought that an injunction would not be granted to restrain the breach of any contract, unless the contract were of such a character that the court could fully enforce the performance of it on both sides. Upon this ground there were many decisions refusing to interfere with contracts for personal services, however flagrant might be the breach of them. *Kemble* vs. *Kean*, 6 Simons, 333; *Kimberly* vs. *Jennings*, ib., 340; *Baldwin* vs. *Society for Diffusion of Knowledge*, 9 ib., 393, in which the courts refused to restrain actors and authors from violating their engagements, because they could not oblige them specifically to keep them. But all these cases were overruled by one of the ablest chancellors who has adorned the woolsack, in *Lumley* vs. *Wagner*, 1 De Gex M. & G., 616. In that case a singer had agreed to sing at the plaintiff's theater for three months, and not to sing at any other, and the court enjoined her from performing at a rival establishment, though it was clear and was admitted that the court could not oblige her to sing for the plaintiff. This case was fully in accord with *Morris* vs. *Coleman*, 18 Ves., 437, which had been disregarded or explained away in many of the intervening cases.

It is now firmly established that the court will often interfere by injunction when it cannot decree performance. Thus it said that the writ may issue to restrain the use of a ship contrary to an agreement for charter, though the agreement was not personally binding on the defendant who was a mortgagee. *De Mattos* vs. *Gibson*, 4 De Gex and Jones, 276; that a tenant may be restrained from doing anything which will prevent the demised premises being used as an inn, though he cannot be forced to keep the inn as he had covenanted to do. *Hooper* vs. *Broderick*, 11 Simons, 47; that where two railway companies had made an agreement for the use by each of the road of the other, the court might enjoin the obstruction of such use by one of the parties, though it could not enforce full performance of the whole agreement. *Great Northern Railway Co.* vs. *Manchester, etc., Railway Co.*, 5 De Gex & Small, 138. The case of *Lumley* vs. *Gibson*, *ubi supra*, has been followed in numerous cases concerning actors, authors, and publishers. *Webster* vs. *Dillon*, 5 W. R., 867; *Stif* vs. *Cassell*, 5 Jurist N. S., 348. The case of *Fechter* vs. *Montgomery*, 33 Beavan, 22, sometimes cited as opposed to these decisions, is not so at all; the decision there was that the actor had the right to renounce his engagement because the manager had not fulfilled his part of the contract. See, also, *Slee* vs. *Bradford*, 4 Giffard, 262; *Rolfe* vs. *Rolfe*, 15 Simons, 88; *Dietricheen* vs. *Cabburn*, 2 Phillips, 52, has much resemblance to the case at bar. The defendant owned a patent medicine and appointed the plaintiff his wholesale agent for the sale of it, and agreed to supply him with all the medicine he should order at forty per cent. discount from the current retail price, and covenanted not to sell to any one else at a greater discount than twenty-five per cent. above that current price. On demurrer, the lord chancellor, overruling the vice-chancellor, sustained the bill which sought to enjoin the defendant from selling to any one else at less than the agreed discount, and for an account. It is plain, I think, that the decision would have been the same if the defendant had agreed not to sell to any one else on any terms. This case virtually overruled *Hills* vs. *Croll*, 2 Phillips, 60, decided a year earlier. (See the able note of the reporter at the end of the last-mentioned case.) These are but a few of the decisions, though they are among the most important of them.

This is certainly a subject upon which it is almost impossible to reconcile the decisions, and of such inherent difficulty that I know of no other in which the appellate courts have so often reversed the decisions below. I have examined a great many of the cases, and some apparent contradictions may be understood by recollecting that the granting or refusing an injunction is scarcely ever a matter of strict right, and that any attempt to lay down precise and invariable rules on the subject must necessarily fail. There are many cases in which injunctions have been refused in behalf of the employed, when, upon the precedent of *Lumley* vs. *Wagner*, and that class of cases, they would have been granted to the employers. This seems unequal. The explanation, such as it is, appears to be, partly, that courts of equity are unwilling to force upon any one an agent or servant who is personally disagreeable, if the relation between the parties is at all a personal or confidential one; and, partly, that, on the part of the agent or servant, the remedy at law is usually adequate, both from the nature of the contract and the standing of the parties. (See *Mair* vs. *Himalaya Tea Co.*, L. R., 1 Eq., 411; *Johnson* vs. *Shrewsbury, etc., Railway Co.*, 3 De Gex, M. & G., 914.) There are other cases which I can reconcile with those I have above cited only on this ground, that where the subject-matter or business is of public importance, such as the management of a railway, the courts will not risk a total stoppage of the business by injunction when they cannot go forward and regulate the whole matter by a decree for specific performance. *Peto* vs. *Brighton, etc., Railway Co.*, 11 W. R., 874; *Johnson* vs. *Shrewsbury, etc., Railway Co.*, 3 De Gex M. & G.

I think the fair result of the later cases may be thus expressed: If the case is one in which the negative remedy of injunction will do substantial justice between the parties by obliging the defendant either to carry out his contract or lose all benefit of the breach, and the remedy at law is inadequate, and there is no reason of policy against it, the court will interfere to restrain conduct which is contrary to the contract, although it may be unable to enforce a specific performance of it. It seems to me that this case comes easily within this rule. The court cannot, perhaps, superintend the performance of a contract to manufacture machines, but it can restrain the defendants from selling in violation of their agreement.

The case may also be looked at in another view, which was presented in the plaintiff's argument. This is not only an agreement between the parties that certain things shall be done by them, but it is also the grant of an exclusive license (excepting for France and Boston) to the plaintiffs to sell the patented machines. And it has never yet been doubted that the court could restrain all persons, whether they were acting with or without notice, and whether bound by contract or not, from trespassing on such a title.

But it is said to be fatal to the plaintiff's case, that the contract is not a mutual one. This want of mutuality is found in the article which limits the penalty for a forfeiture on the plaintiff's part to a mere loss of the agency. This is said to be equivalent to an agreement that the plaintiffs may renounce at any time; and so it is argued that only one party is bound to this agreement. It is no doubt true, in general, that where only one side is bound to an agreement which remains wholly executory, a court of equity will not usually interfere to enforce the agreement against the party who is bound. The simplest case of this kind is where an infant is one party to a contract for the sale of land. The reason given is, that the party who is not bound would enforce the contract if for his advantage, and repudiate it if the contrary. *Lawrenson* vs. *Butler*, 1 Sch. & Lef., 13. The doctrine is often invoked in that class of cases. But there are innumerable cases where the party seeking performance is no longer bound to anything, having paid the consideration in the outset, or performed his part, or where the plaintiff does not rest on a contract wholly executory, to which this doctrine does not apply. I have some doubt of its application to this case. Supposing the stipulation to mean what the defendants contend it does, that the

plaintiff may renounce at any time, which may be doubted, still, if the defendants, for valuable considerations, have given the plaintiffs an exclusive license until they forfeit it, I do not see why a court of equity should not protect that license by its injunction, as usual, so long as it is not forfeited. A very strong case was cited from 10 Wallace, in which the Supreme Court refused to decree the specific performance of a contract for quarrying marble, &c., on the ground, among several others, that the plaintiff had the right to give up the arrangement on a year's notice. I cannot think that the court intended to announce any general proposition that they would never enforce a contract which one party had a right to put an end to in a year. Everything must depend upon the nature and circumstances of the business. In many of the cases that I have cited, the plaintiff had it in his power to end the contract. It is certainly competent to the parties to make a contract which will be equitable and reasonable, and in which their rights ought to be protected while they last, though it may be terminable by various circumstances, and though one party may have the sole right to terminate it, provided their stipulation is not one that makes the whole contract inequitable. In the note which I have above referred to in the case of *Hills* vs. *Cook*, the learned reporter thinks it quite clear that a contract by the defendant to buy all his acid of the plaintiff, so long as the plaintiff chose to deal with him, would be valid and would be enforced by injunction. In *Rolfe* vs. *Rolfe*, *ubi supra*, the vice-chancellor notices the fact that the plaintiff could stop his own business when he chose, and thereby deprive the defendant of the employment agreed on, yet he restrained the defendant in the meantime from working for a stranger.

The remedy by injunction is a very elastic and adaptable one, and there is no sort of difficulty in granting it until, by a change of circumstances, it shall appear that it ought to be dissolved. A bill may be retained for that purpose for any number of years that may be requisite. The argument, to be sound, must go this length, that, after the plaintiffs have ordered a thousand machines, and have paid for them, and are selling them in all the countries of the world excepting France, there is no adequate remedy against the defendants' underselling them in all those markets. I do not mean to be understood that this point would not apply to an injunction bill as well as to one for specific performance, nor that it is not a doubtful one. But the contract contains in itself, as we have seen, not only executory agreements on both sides, but a present grant, for value, of the exclusive right to sell; and my present impression is that such a grant is good, and is to be enforced, so long as it lasts, whether the remainder of the contract is mutual or not, provided the whole contract, including the grant, is not so unequal as to be void in a court of equity, which, as at present advised of the facts, I see no reason to hold.

It seems to me, therefore, that the plaintiff's case has a sufficient appearance of justice to require the court to keep things as they are by restraining all conduct which will put it out of the power of the defendants to fulfill their contract, until the facts and law can be fully ascertained.

Injunction ordered.

APPLICATIONS FOR EXTENSION.

Applications having been duly filed and are now pending for the extension of the following Letters Patent. Hearings upon the respective applications are appointed for the days hereinafter named.

22,599.—Dedocating and Clarifying Cane-Juice.—Granted to RICHARD A. STEWART, January 11, 1859. Application filed September 24, 1873, under act of Congress approved March 3, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,564.—Top-Props for Carriages.—Granted to GEORGE COOK and HANNIBAL I. KENDALL, December 27, 1859. Application filed August 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,582.—Harvesters.—Granted to JOHN GORE, December 27, 1859, and reissued January 15, 1861. Application filed September 22, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,584.—Machines for Planing Curved Surfaces.—Granted to JONATHAN P. GROSVENOR, December 27, 1859. Application filed September 24, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,599.—Horse Hay-Rakes.—Granted to SAMUEL LEGRO, December 27, 1859. Application filed September 23, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,614.—Manufacture of Porous Ware.—Granted to BRADFORD S. PIERCE and MASON R. PIERCE, December 27, 1859. Application filed September 26, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,627.—Lathe Attachment for Cutting Veneers.—Granted to BENJAMIN F. STURTEVANT, December 27, 1859. Application filed September 25, 1873. Testimony closes November 25, 1873. Hearing December 10, 1873.

26,674.—Clothes-Driers.—Granted to B. B. HAWES, January 3, 1860. Application filed October 3, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,679.—Double-Seaming Machines.—Granted to LESTER T. HULBERT, January 3, 1860. Application filed September 29, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,689.—Pivot-Bearings.—Granted to FRANCIS C. LOWTHROP, January 3, 1860. Application filed October 6, 1873. Testimony closes December 2, 1873. Hearing December 17, 1873.

26,785.—Waste-Cocks of Hydrants.—Granted to GEORGE W. ROBERTSON, January 10, 1860. Application filed October 3, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,808.—Manufacture of Boots and Shoes.—Granted to FRANCIS D. BALLOU, January 10, 1860, and reissued April 20, 1869. Application filed October 4, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,829.—Tool for Cutting Round Tenons.—Granted to LEVI A. DOLE, January 10, 1860. Application filed September 30, 1873. Testimony closes December 9, 1873. Hearing December 24, 1873.

26,860.—Machines for the Manufacture of Tinware, granted to SAMUEL J. OLMSTED, January 17, 1860. Application filed October 16, 1873. Testimony closes December 16, 1873. Hearing December 31, 1873.

26,891.—Catches for Spectacle-Cases.—Granted to GEORGE N. CUMMINGS, January 24, 1860. Application filed September 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,902.—Planing-Machines.—Granted to SOLOMON S. GRAY, January 24, 1860. Application filed October 22, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,906.—Stitches.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,914.—Clothes-Wringers.—Granted to ROBERT O. MERRIAM and AMOS B. PARSON, January 24, 1860. Application filed October 28, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,919.—Repeating Fire-Arms.—Granted to WILLIAM H. MORRIS and CHARLES L. BROWN, January 24, 1860, and reissued August 1, 1871. Application filed October 23, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,942.—Seats and Couches for Railroad-Cars.—Granted to THEODORE T. WOODRUFF, January 24, 1860. Application filed October 25, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,948.—Sewing-Machines.—Granted to ALBERT F. JOHNSON, January 24, 1860. Application filed October 24, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

26,952.—Lamps, granted to GEORGE NEILSON, January 24, 1860. Application filed October 18, 1873. Testimony closes December 23, 1873. Hearing January 7, 1874.

27,008.—Machines for Attaching and Finishing Boot-Heels.—Granted to HERMAN SALOSHINSKY, January 31, 1860, and reissued March 26, 1867. Application filed October 28, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,020.—Variable Exhaust-Pipe for Steam-Engines.—Granted to GEORGE EDWARDS, January 31, 1860. Application filed November 1, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,023.—Calendar-Clocks.—Granted to EUGENE M. MIX and JAMES E. MIX, January 31, 1860. Application filed October 31, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

27,034.—Harvesters.—Granted to JOHN BUTTER, February 7, 1860; and reissued June 13, 1871. Application filed November 4, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,043.—Lock for Umbrella-Stands.—Granted to ALFRED M. FOOTE, February 7, 1860. Application filed November 8, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,065.—Coffee-Mills.—Granted to JOHN and EDMUND PARKER, February 7, 1860. Application filed October 9, 1873. Testimony closes January 6, 1874. Hearing January 21, 1874.

27,094.—Machine for Making Cartridge-Cases.—Granted to ETHAN ALLEN, February 14, 1860, and reissued May 9, 1865, in two divisions, numbered, respectively, 1,948 and 1,949. Application filed November 11, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,135.—Sugar-Cutters.—Granted to CHARLES KIESLER and WILHELM ROSENBOCK, February 14, 1860. Application filed November 13, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,139.—Hanging Rudders.—Granted to JOSEPH P. MANTON and HENRY A. BILLINGS, February 14, 1860. Application filed November 16, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,179.—Marking-Gages for Sewing-Machines.—Granted to CALVIN D. WHEELER, February 14, 1860. Application filed November 14, 1873. Testimony closes January 13 1874. Hearing January 28, 1874.

27,185.—Soldering-Irons.—Granted to AMOS BURBANK, February 4, 1860. Application filed November 8, 1873. Testimony closes January 13, 1874. Hearing January 28, 1874.

27,241.—Photographic Cameras.—Granted to AUGUST SAMMENDINGER, February 21, 1860. Application filed November 20, 1873. Testimony closes January 20, 1874. Hearing February 4, 1874.

27,291.—Seed-Planters.—Granted to JOHN S. HUGGINS, February 28, 1860. Application filed November 24, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,297.—Couches for Railroad-Cars.—Granted to EDWARD C. KNIGHT, February 28, 1860. Application filed November 29, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,303.—Fastening Saw-Handles.—Granted to JACOB NEIMEYER, February 28, 1860. Application filed November 28, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,319.—Machine for Bending Sheet Metal.—Granted to ORSON W. STOW, February 28, 1860; and reissued August 4, 1868. Application filed October 28, 1873. Testimony closes January 27, 1874. Hearing February 11, 1874.

27,406.—Cultivators.—Granted to ROBERT CRAIG, March 6, 1860. Application filed November 22, 1873. Testimony closes February 3, 1874. Hearing February 18, 1874.

27,456.—Machines for Covering the Springs of Skeleton Skirts.—Granted to JOHN T. LOFT, March 13, 1860. Application filed October 6, 1873. Testimony closes February 10, 1874. Hearing February 25, 1874.

30,467.—Apparatus for Singeing Figs.—Granted to ABRAHAM and EDWARD M. DENNY, October 30, 1860. Patented in England February 2, 1860. Application filed October 17, 1873. Testimony closes December 30, 1873. Hearing January 14, 1874.

31,262.—Faro-Boxes.—Granted to JOHN B. SLAWSON, January 29, 1861. Patented in England January 16, 1860. Application filed October 7, 1873. Testimony closes December 16, 1873. HearingDecember 31, 1873.

EXTENSIONS GRANTED.

26,243.—Improved Water-Closet Basin, granted to WILLIAM BOCH, Sr., November 29, 1859; (MARGARETHA MAIDHOF, executrix.)

Claim.—A water-closet basin having a covered annular waterpassage, B, at its upper edge, as herein shown and described.

26,269.—Improved Journal-Box for Saw-Mill Carriages, granted to WILLIAM M. FERRY, Jr., November 19, 1859.

Claim.—A single casting, A, molded with an intermediate space, B, and with offsetting boxes C D on each side of said space, substantially as and for the purposes set forth.

26,276.—Improvement in the Manufacture of India-Rubber Hose, granted to THOMAS J. MAYALL, November 29, 1859; reissued October 22, 1872, numbered 5,111.

Claim.—1. In india-rubber hose, the application of some of the preservative compounds herein mentioned or their equivalent antiseptics to hose, so as to preserve the same, substantially as described.

2. The improved india-rubber hose prepared by combining some of the substances herein named or their equivalent antiseptics with the fibrous material composing the same, substantially as described.

26,321.—Improvement in Molding for Metal Casting, granted to JOHN P. BROADMEADOW, November 29, 1859.

Claim.—1. The combined use of a half-flask, of a sufficient size to hold the quantity of loose sand required to form a half-mold, and of a follow-board small enough to enter the said half-flask and act as a piston to compress the sand therein when pressure is applied, substantially as herein set forth.

2. The combined use of a half-flask, as above described, and of a strike whose profile corresponds in form with the transverse section or profile of the pattern, substantially as herein set forth.

3. The combined use of a half-flask, as above described, constituting the cope, of a ribbed cope-plate fitted to enter therein, and of sustaining-pins in the said cope, the whole operating substantially as herein set forth.

4. The combined use of the aforesaid cope-plate, of a bottom-plate fitted to enter the drag of the flask, and of clamps, substantially as herein set forth.

5. Combining the spine-pattern with the follow-board, when this combination is used in connection with a match-board having an opening to permit the descent of the lower end of the spine-pattern, substantially as herein set forth.

6. The combination of projections or indentations, or both, with the follow-board, in contradistinction to constructing the flasks with projections and indentations.

26,327.—Improvement in Nursing-Bottles, granted to FRANCIS J. LA FORME, November 29, 1859; reissued January 14, 1868, numbered 2,831.

Claim.—1. An improved nursing-bottle, having its body A composed of glass or other suitable material, and provided with an elastic nipple or mouth-piece, *f*, and a flexible or pendulous tube, C, applied thereto, substantially in manner and so as to operate as and for the purpose set forth.

2. In a nursing-bottle, otherwise properly organized, the use or application of a flexible or pendulous tube, substantially as and for the purpose set forth.

3. The application of a gravitating tip or tube, *c*, to the lower end of the flexible tube C, substantially as and for the purpose set forth.

26,329.—Improved Boot and Shoe Tip, granted to NEWMAN SILVERTHORN, November 29, 1859; reissued September 2, 1862, numbered 1,339; reissued August 4, 1868, numbered 3,070.

Claim.—A formed tip, substantially as described, as an article of manufacture.

DESIGNS PATENTED DURING THE WEEK.

[Each Design bearing date November 25, 1873.]

7,002.—Knife-Handle.—JAMES D. FRARY, New Britain, Conn. Application filed November 13, 1873. Term of patent 7 years.

7,003.—Inkstands.—GEORGE W. MCGILL, New York, N. Y. Application filed August 22, 1873. Term of patent 7 years.

7,004.—Ornamental Plate.—LOUIS MOSELEY, New York, N. Y. Application filed August 21, 1873. Term of patent 7 years.

TRADE-MARKS REGISTERED DURING THE WEEK.

[Each Trade-Mark bearing date November 25, 1873.]

1,537.—Emery.—ABBOTT & HOWARD, Boston, Mass., and New York, N. Y. Application filed November 12, 1873.

"a turkey's head on a shield. A band with the words 'Ecton Mills' and 'Selected Turkey Emery.'"

1,538.—Guano.—GUANAHANI GUANO COMPANY, Petersburg, Va. Application filed November 17, 1873.

"'Guanahani.'"

1,539.—Plows.—HUNTER & FROST, Fredericksburg, Va. Application filed November 18, 1873.

"'Farmer's Friend, Perfected.'"

1,540.—Perfumery and Toilet Articles.—FELIX PROT & COMPANY, Paris, France. Application filed November 7, 1873.

"an oblong label bearing a shield bordered with scroll-work, on which are the words 'Parfumeur Lubin,' &c., a white scroll running diagonally across it, bearing the device 'Lubin,' and on its left-hand border the words F. PROT & CIE., successeurs,' and on the right-hand border the words '55 Rue Ste. Anne, Paris.'"

1,541.—Cigars.—THOMAS B. SLINGERLAND, Rome, N. Y. Application filed November 15, 1873.

"'Roman Emperor.'"

1,542.—Cigars and Tobacco.—THE CONSOLIDATED TOBACCO COMPANY, Gilroy, Cal. Application filed October 8, 1873.

"'The Pride of California.'"

1,543.—Teas and Coffees.—THE GREAT EASTERN TEA COMPANY, Terre Haute, Ind. Application filed November 3, 1873.

"a picture of a steamship with the words 'The Great Eastern Tea Company.'"

1,544.—Organs.—GEORGE WOODS & COMPANY, Cambridgeport, Mass. Application filed July 25, 1873.

"'Pianorgan.'"

INVENTIONS FOR WHICH PATENTS WERE GRANTED DURING THE WEEK.

[Each Patent bearing date November 25, 1873.]

ORIGINAL PATENTS.

144,820.—Steam-Plow.—ISAAC S. ALLEN, MONTELIOUS P. BROWEN, and CHARLES W. MOULTHROP, San Francisco, Cal. Application filed February 11, 1873.

The driving-wheels are provided with hollow journals, through which the driving-shaft of the machine passes, giving motion to a series of rotary cutters, which are mounted upon a shaft which is attached to the rear ends of swinging bars.

Claim.—1. The crank-shaft D, with its driving and intermediate gear-wheels for giving motion to the traction-wheels, and the hollow axles F F, in combination with the traction-wheels, the cranks G G, connecting-rods I I, and frame K, for raising and lowering the cutters, substantially as and for the purpose set forth.

2. The combination of the shaft D, through the hollow axles F F, and the cranks G G, connected, by the rods H H, to cranks I I and frame K, with shaft J, substantially as and for the purpose set forth.

144,821.—Piney-Fire for the Manufacture of Iron.—THOMAS ASH and ZECHARIAH WALKER, Trenton, N. J. Application filed August 22, 1873.

The bottom of the exterior walls on each side connect with a wrought-iron interior wall or casing extending part way up on each side of the furnace and uniting to form an arched top, the whole forming a water-casing for the working-chamber. The products of combustion from several fires pass through one boiler, utilizing the waste heat.

Claim.—1. A fire or furnace for making charcoal-iron, having its outer and inner walls or castings constructed of wrought-iron, substantially as specified.

2. A charcoal-iron fire or furnace, constructed of wrought-iron plates or castings A E, with the water-space F between said castings, and provided with orifices *f* and *g* for the introduction and exit of the water, substantially as set forth.

3. The combination of one or more charcoal-iron fires or furnaces with a boiler, substantially as and for the purpose described.

144,822.—Feeding Paper to Rotary Printing Presses.—JOHN T. ASHLEY, Brooklyn, E. D., N. Y.—Case A. Application filed May 23, 1873.

The paper is fed from the feed-board to the hollow impression-cylinder, which is closed at one end, and the other connected, by means of a hollow journal and pipe, to an exhaust-engine, when, the air being exhausted, the edge of the paper is held to the cylinder by the atmospheric pressure over the holes. The cylinder rotating, the impression is made, and, at the desired moment, the valve is opened by the toe coming in contact with the stop, admitting air and releasing the paper, which is drawn to the second cylinder by the exhaustion through the portion opposite the slot, and carried around to the receiving-tray. Air is ejected from the pipes *g* and *g'*, through small perforations, against the paper to keep it smooth and in contact with the cylinder. The blast is suspended in the pipe *g'* by the opening of a valve, while the paper is being fed to the cylinder. The tray is placed in an oblique position, so that the sheets are piled with two of their edges even.

Claim.—1. One or more pipes, *g*, applied to induce blasts of air onto the sheets as they are moved around on the surface of the cylinder C, substantially as described.

2. The hollow rotating impression-cylinder C for taking the sheets one at a time from the feed-board B, in the manner described, in combination with a taking-off cylinder, which removes the printed sheets from the impression-cylinder and delivers them into a tray, substantially as described.

3. The stationary slotted exhaustion-bar J and the perforated rotary cylinder D^2, combined with the impression-cylinder C, substantially as described.

4. The blast-pipe *g'*, arranged above the front edge of the feed-table B, and perforated so as to direct blasts of air upon the top sheets while they are being drawn off by the impression-cylinder C, substantially as described.

5. The valve-opening *r* through the head of the hollow impression-cylinder provided with a valve, r^2, and valve-trip, in combination with a tubular journal, A, and fixed tubular journal-box *l* for receiving a hose, substantially as described.

6. The double inclined tray P, having all sides fixed and arranged to take the sheets directly from the rotating cylinder D^2, and by the gravity of the sheets alone adjust two of their edges even, in combination with the perforated discharging-cylinder D^3, substantially as described.

144,823.—Metallic Plane.—JOSEPH F. BALDWIN, Boston, assignor to JOHN SULLY, trustee, Dedham, Mass. Application filed June 7, 1873.

A metallic carriage, *g*, supporting the iron *l*, is operated by a screw-nut, A, on the rod *s*.

Claim.—The carriage *g*, provided with the flanges *g'* *i* and stem *k*, in combination with the plane-iron *l* having orifices *l' l''*, the nut A having the groove *g''*, and the screw-rod *s*, all arranged and operating substantially as described.

144,824.—Billiard-Cue Clamp.—OLIVER D. BENJAMIN, Toledo, Ohio. Application filed October 29, 1873.

The bracket is fastened to the wall at a proper height to bring the screws of the spring-rods against the freshly-cemented tips and hold them until dry, the butts of the cues standing on the floor.

Claim.—The bracket, formed of the bars A and B, carrying the spring cue-clamps C, and adapted to be screwed or otherwise secured to the wall, as shown and described, for the purpose specified.

144,825.—Inkstand.—BLOOMFIELD BROWER, New York, N. Y. Application filed August 11, 1873.

Claim.—The barometer-inkstand A B, provided with the removable perforated or slotted funnel D, contracted to a point, having a small opening therein and in the neck B, so that the ink in the neck and the ink in the funnel will be on the same level without the employment of mechanical agencies, as set forth.

144,826.—Wrench.—TIMOTHY L. BUCKLEY, Mankato, Minn. Application filed July 12, 1873.

Recesses with shoulders are formed on the inner faces of the jaws. The spring is slightly compressed and sprung into the recess without other means of fastening.

Claim.—The wrench described, consisting of the brace A, having the solid portion *a*, with arm a^1 and rod *c*, pivoted arm *b* with enlarged opening for the rod *c*, independent spring *e*, and recess b^1, adapted to hold the spring without other fastening, and set-screw *d*, combined and arranged as described.

144,827.—Hose-Wrench.—EDWARD BUCKLIN, Jr., Pawtucket, R. I., assignor to CHARLES E. DAVIS and FRANK A. NEWELL, same place. Application filed November 5, 1873.

A jointed clutch having a perforation in either arm to fit the projections on the coupling, the upper half having a short rearward extention with a thumb-rest, supported by a spring for keeping the arms tightly down upon the coupling after the pressure is removed from the thumb-rest.

Claim.—A hose-wrench composed of a jointed semicircular clutch, having the ends of the arms thereof perforated, as shown, and having the rearward extension *g* and spring *i*, all substantially as and for the purposes set forth.

144,828.—Mop-Wringer.—AARON W. BUNNELL, Lincsville, Pa. Application filed March 29, 1873.

Claim.—The combination of the wringer mop-holder having the mop-head *b* rigidly attached to the sleeve *a*, and the wringer cross-bar *z* rigidly attached to the handle-shank B, and the offset *c*, or its equivalent, rigidly attached to the sleeve *a*, as specified.

144,829.—Blast-Furnace.—FRANZ BÜTTGENBACH, Heerdt Düsseldorf, Germany. Application filed May 5, 1873.

The hollow blocks which protect the boshes can be used also with the tuyeres. The cast-iron plate, wherein is cast a coiled pipe for the circulation of water, forms, together with the dam-plate, a closed breast.

Claim.—1. The water-blocks *c*, corresponding in form with the tuyeres, and interchangeable with the same, as and for the purpose described.

2. The combination of the cast-iron plate *i*, constructed as described, with the dam-plate *j*, as set forth.

3. The upper gallery or platform of a blast-furnace, supported either entirely or partially by the "down-come" gas pipes or mains *g*.

144,830.—Machine for the Manufacture of Flour.—THOMAS CARR, Bristol, Great Britain. Application filed April 23, 1871.

Reduces seed to flour by percussion, the grain falling between toothed disks revolving at great speed in opposite directions.

Claim.—1. A flour-mill consisting of parallel disks, carrying five or more annular rows of bars or cages, arranged alternately, and devices, substantially as described, for rotating the disks and cages rapidly in opposite directions.

2. The disk *d'*, carrying two or more concentric series of bars, in combination with the parallel disks and cages, rotating in opposite directions, as set forth.

3. The combination of the disks, rotating in opposite directions, their cages, and the inner chamber, provided with openings or slots adjustable in size, substantially as specified.

4. The combination, with the disks and cages, of an outer casing having an outlet, *g'*, as and for the purpose specified.

144,831.—Valve-Actuating Mechanism for Engines.—FRANK CHASE, Boston, assignor to himself and GEORGE S. SCAMMON, Malden, Mass. Application filed November 3, 1873.

The D-valve is actuated by an annular principal plunger, attached thereto and into which the ends of an auxiliary bisected plunger fit. Auxiliary ports in cylinder and plungers admit and exhaust steam to the opposite ends of the auxiliary plunger.

Claim.—The auxiliary plunger H and the principal annular plunger C, for actuating the valve D, in combination with the steam-cylinder A and chest B, provided with ports and exhaust-passages, constructed and arranged for operation substantially as and for the purpose described.

144,832.—Die for Forging Wrench-Bars.—LORING COES, Worcester Mass. Application filed October 9, 1873.

Claim.—The combination of the forging-dies described, having rectangular corner-grooves, the parallel sides of which are unequal in breadth, said dies being so associated and combined in pairs that the broad sides of the grooves in one pair shall slant to the right, and the similar sides of the other pair slant to the left, each for the purpose of welding in the fin left on the bar by the other, as shown and specified.

144,833.—Horseshoe.—ROBERT F. COOKE, Brooklyn, N. Y. Application filed July 30, 1873.

Claim.—1. A horseshoe made of india-rubber, having an outer lip or projection, *w*, and inner lip or projection, *v*, running around the hoof, in combination with a cloth or canvas lining, *w*, and gutta-percha filling, *v*, substantially as and for the purpose set forth.

2. The combination of the india-rubber shoe A', two or more thicknesses of leather, *s s*, or its equivalent, the outer lip or projection *w*, and the gutta-percha lining *v*, substantially as and in the manner specified.

3. The cloth or canvas lining *w*, to strengthen the horseshoe and act as a means of connecting the india-rubber and gutta-percha together.

4. The herein-described mode of attaching horseshoes made of india-rubber or india-rubber combined with leather or similar suitable material, to the horse's hoof by means of gutta-percha mixed with rosin, shellac, or similar resinous gums, substantially as set forth.

144,834.—Water-Tank for Hotels.—JAMES H. CORAY, New York, N. Y. Application filed May 29, 1873.

Water flows through a coil of pipe in a tank adapted to receive exhaust steam, which heats the water in the coil. The water flows into another tank, in which is a steam-coil, where it is further heated. This coil, by means of suitable connecting-pipes, may receive either live or exhaust steam.

Claim.—1. The combination of the steam-tank C D with its coil of water-pipe F', water-tank E F with its steam-pipe L, the pipes I J for the induction of exhaust steam from the engine, and connecting-pipe K, constructed and arranged to operate substantially as described.

2. In combination with the steam-tank C D with its coil of water-pipe, the water tank E F with its coil of steam-pipe, the pipes I, J, and B, and connecting-pipe K, the pipe N for the induction of water from the dripping-pipes, all constructed and arranged to operate substantially as described.

3. In combination with the steam-tank C D and its coil of water-pipe, the water-tank E F and its coil of steam-pipe, the pipes I, J, and B, and connecting-pipe K, the pipe P for introducing live steam, all constructed, combined, and arranged to operate substantially as described.

4. In combination with the steam-tank C D and its coil of water-pipe, the water-tank E F and its coil of steam-pipe, the pipes I, J, and B, and connecting-pipe K, the pipe O for introducing return steam, all constructed, combined, and arranged to operate substantially as described.

5. In combination with the steam-tank C D and its coil of water-pipe, the water-pipe E F and its coil of steam-pipe, the pipes I, J, and B, and connecting-pipe K, the pipes N, O, P, and T, with valves *a*, *b*, *c*, and *d*, all combined and arranged to operate substantially as described.

144,835.—Milk-Cooler.—AUGUSTUS J. CRANE and DENNIS J. HADLEY, Cambridge, Vt. Application filed September 6, 1873.

Water is admitted to and withdrawn from the water-chamber through small tubes connecting with larger pipes, and milk is drawn from the cooler through an aperture in a pipe provided with a flanged head, to close the outer tube when the pipe is pushed down.

Claim.—1. The milk-cooler consisting of milk-pan B, with water-chamber C extending at bottom thereof, and provided with inlet-pipes D *d a*, and outlet-pipes *d'* D', and tubes E E', substantially as and for the purposes described.

2. The sliding tube E, having broad head and aperture *e* fitted into tube E' for closing pan B and drawing off the milk from the same, substantially as set forth.

144,836.—Grain-Separator.—SAMUEL DAW, Corvallis, Oreg. Application filed July 10, 1872.

An irregular horizontal and vertical motion is communicated to the suspended screen by a connecting-rod driven by a crank, and attached near the front corner of the screen, and by a lever below the screen operated by a pin-wheel.

Claim.—In apparatus for cleaning wheat and other small grain, the combination, with a suspended screen, B, of the lever H, pin R, wheel Q, connecting-rod O, and crank N, arranged and operating as set forth.

144,837.—Grape and Flower Picker.—CHARLES W. H. DELANO, Cedar Rapids, Iowa. Application filed May 23, 1873.

A pair of shears, one jaw of which carries a flange, projecting at right angles to the face of the jaw, the other jaw having a recess for a block of india-rubber for holding the fruit or flower stem. The rubber is held in place by an angular piece and spare.

Claim.—The grape and flower picker herein described, consisting of the jaw D provided with the metallic flange *d*, the jaw F provided with the flange *f*, the removable angle piece G, and rubber pad E, the plate G and jaw F being provided with spurs *g*, all combined and arranged substantially as and for the purpose shown and described.

144,838.—Collar and Cuff Drier.—DAVID W. DE FORMET, Petersburg, Va., assignor of two-thirds his right to SIDNEY S. NORTON and FRANK P. NORTON, Brooklyn, N. Y. Application filed October 4, 1873.

Claim.—A collar or cuff drier, consisting of a bar having a zigzag-shaped wire for holding the collars or cuffs, in combination with a hook at each end of the bar, and a holder for suspending the drier from a line, substantially as and for the purpose set forth.

144,839.—Machinery for Finishing the Nap of Woolen Cloth.—JOHN DOBSON, Philadelphia, Pa. Application filed May 19, 1873.

The devices claimed give the rubbing-bed an elliptical motion, and it rubs the nap to form what is called the chinchilla finish. By adjusting the locking-pieces, the movement of the bed is altered, and different patterns will be produced.

Claim.—The bed B and its adjustable locking-pieces *a a'*, in combination with the rods *c c'*, connected directly with such bed, and operating eccentrics, as and for the purpose described.

144,840.—Apparatus for Delivering and Drawing Long-Fibered Wool After Carding.—JOHN DOBSON and JAMES DOBSON, Philadelphia, Pa. Application filed March 17, 1873.

The slivers of long-fibered wool from two or more carding-machines are delivered side by side onto an endless apron, whence they pass through a suitable drawing-frame, and are deposited in a can.

Claim.—In preparing wool on cards for combing and deliver-

ing the sliver from a number of cards through one delivery, the combination of endless apron B and a delivery-head composed of three pairs of rollers, R, R′, and R″, as shown and described.

144,841.—Pulling-Mill.—RUDOLF EICKEMEYER, Yonkers, N. Y. Application filed April 4, 1873.

The hinged apron and the flange hinged to its top are independently and jointly adjustable to vary the area of the pulling-space. The straps which elevate the stocks are operated by griping-rollers, which alternately seize and release them. These rolls are actuated by gear-wheels so hung in an adjustable frame that the contact of the rolls may be governed, and the height to which the stocks are raised thereby determined.

Claims.—1. The combination, substantially as before set forth, of the adjustable tip and the adjustable apron of the bed of the pulling-mill.

2. The combination, substantially as before set forth, of the pulling-stock with adjustable raising mechanism, which is adjustable to vary the distance to which the pulling-stock is raised, so that the force of the blow can be varied as the pulling progresses.

3. The combination, substantially as before set forth, of the adjustable bed for the pulling-mill, the pulling-stock, and the adjustable raising mechanism for the pulling-stock, so that the resistance to the movement of the articles may be increased when the force of the blow is increased.

4. The combination, substantially as before set forth, of the pulling-stock the adjustable raising mechanism therefor, and the cone-pulley for varying the number of strokes of the pulling-stock in a given time.

5. The combination, substantially as before set forth, of the pulling-stock, the raising-strap, and the griping-rollers.

6. The combination, substantially as before set forth, of the raising-strap, the eccentric griping-rollers, and the adjusting mechanism for varying the relative angular positions of said rollers, so as to vary the time during which they operate upon the raising-strap.

144,842.—Piano-String Bridge.—WILLIAM C. ELLIS, Worcester, Mass. Application filed August 22, 1873.

The strings, after being tuned, are tightly clamped upon the wrist-plank bridge between non-metallic surfaces to insure permanence of tune and good quality of tone.

Claim.—1. A piano-forte bridge, on which strings are held by wooden or other non-metallic strips inserted in recesses formed in the bottom of a metallic clamp adjusted to and bearing upon said bridge by screws engaging with a metallic plate or nut located in the bottom of the bridge, substantially as specified.

2. In a piano-forte, a metallic clamp, K, having a serrated front edge, and formed with screw-holes, and on the bottom with oblique recesses filled with wood or other non-metallic material, substantially as and for the purpose described.

3. In combination with the clamp K and bridge E, a metallic plate or nut, F, and screws G, substantially as specified.

4. The combination of a pin-block or wrest-plank, A, insulators D, bridge E, plate or nut F, clamp K, and strings C, all arranged substantially as herein set forth.

144,843.—Apparatus for Removing Obstructions from Gas-Pipes.—GEORGE GOLDSMITH and JAMES DILKES, Leicester, England. Application filed February 1, 1873.

The barrel or chamber of the plug is filled with gunpowder, a piece of tissue-paper put over the end of the barrel, and the ring screwed on, a coupling-piece attached to the pipe, and the plug, charged as described, screwed into the barrel, extending a short distance into the pipe. The charge is fired by a percussion-cap.

Claim.—1. The described process of removing obstructions from pipes, consisting in the employment of explosive materials, as and for the purpose described.

2. The apparatus described, consisting of a tube, A, having nipple C, and ring B, the tube being adapted to be screwed into a pipe, as and for the purpose described.

144,844.—Valve for Pumps.—ROSCOE J. GOULD and MATTHEW E. CAMPFIELD, Newark, N. J., assignors to ROSCOE J. GOULD, same place. Application filed June 28, 1873.

An annular bearing of elastic material is retained by its own elasticity within a groove cut in the valve. Narrow rigid bearings are provided within the valve-seat, which receive the valve and take the strain, allowing the water nearly the whole surface to act on to lift it again. The edge of the metal portion projects out over the rubber.

Claim.—1. The arrangement of the outer edges of the parts B and D relatively to each other and to the seat *a*, in combination with the supports A^1 A^2 for receiving the rigid portion of the valve and supporting it when sufficiently depressed, substantially as specified.

2. The construction of the metallic part of the valve B with a groove, in which the rubber or equivalent elastic material D may be retained by its elastic contraction, in combination with such elastic material, and arranged to allow its free portion to be compressed on the seat *a*, as herein specified.

3. In combination with a valve, B, lifted by the force of the fluid, the rigid bearings A^1, contracted at the bearing-points, as represented, so as to support the valve at those points without materially subtracting from the surface acted on by the water in lifting the valve.

144,845.—Cut-Nail Machine.—WORCESTER HADDOCK, Pittsburg, Pa. Application filed May 24, 1873.

The dies in the vibrating head are held in place by hooks. The scrap of nail-plate is taken from the nippers automatically by means of two vertical pivoted prongs. A compensating device on the vibrator connects with the means that operates the vibrator by a hook-connection. The bed-piece on the stationary die-frame is held from forward movement by means of a stop, which enters it from below.

Claim.—1. The die-box A, provided with a recess for the reception of a stop, B, provided with projections C fitted to a recess in the bed-piece, substantially as herein described, and for the purpose set forth.

2. The plate-nipper consisting of the jaw *e* and pivoted jaw *f*, in combination with the locking device consisting of the adjustable slide A, link *i*, and pivoted lever *j*, said parts constructed, arranged, and operating with relation to each other, substantially as hereinbefore described, and for the purpose set forth.

3. In combination with the vibrator *m*, having opening *k* and tongs for griping the plate, the forked lever *l*, substantially as herein described, and for the purpose set forth.

4. The connecting-rod *o*, furnished with hook *t*, in combination with the plate *n′*, having opening *m′*, and held in position with relation to the vibrator *m* through the medium of rods *x* and springs *f*, substantially as described, and for the purpose set forth.

5. In combination with the vibrating griping-head E of a nail-cutting machine, the hooks *n* and keys *s*, arranged and operating substantially as herein described, and for the purpose set forth.

144,846.—Cultivator.—LEVI HAVERSTICK, Manor, Pa. Application filed April 23, 1873.

The irregular-shaped beams are jointed by one overlapping the other. The pivoted shovel-standards are slotted at the upper end, and held in position by a hooked brace, which engages a ratchet-wheel. The strain of a fixed obstruction causes the wheel to turn and releases the shovel-standard.

Claim.—The beams B B′, held on a common center-pin or pivot-bolt, A, in combination with the shovels C, ratchet M, and slip-brace or pawl L, all arranged and operating substantially in the manner and for the purpose described.

144,847.—Bee-Hive.—WILLIAM S. HOUGH, Galt, assignor to himself and SILVANUS CORNELL, Widder Station, Canada. Application filed April 24, 1873.

A platform at the bee-entrance rests upon woven wire, and has channels at its base, into which the moths enter, when they fall through the meshes of the wire, and find no egress except at the back of the hive.

Claim.—1. The flanged honey-board A′, the entrance *a*, and the grating *b*, arranged above the bottom board A, substantially as described.

2. The moth-trap K, recessed on its under side, and provided with the passages *i*, arranged and operating as described.

144,848.—Self-Closing Railroad-Switch.—THADDEUS K. HUBBELL and GEORGE H. GREGORY, Wilton, Conn. Application filed March 22, 1873.

When the switch is set for the siding, a spring is compressed, and detent-levers are at the same time brought at right angles to the main rails by mechanism which also locks the switch in position. A train along the main line trips these levers, thus allowing the spring to replace the switch.

Claim.—1. The detent-levers T T, rods V V, tripping-bar W, sway-bar R, lever N, shoulder Q, springs P and L, bar F, arranged substantially as and for the purposes described.

2. The spring P, in combination with the bar F, as and for the purposes described.

3. The arrangement of the sway-bar R and lever N, as and for the purposes described.

144,849.—Wagon-Brake.—EDWIN N. JACK, Williamsburg, Ohio. Application filed July 21, 1873.

Claim.—1. The movable suspension-rod D, constructed to operate as and for the purposes set forth.

2. The brace-rods C C′, in combination with the suspension-rod D, as and for the purpose set forth.

144,850.—Sifting-Shovel.—CHARLES KARSTNER, Chicago, Ill. Application filed May 21, 1873.

The entire body of the shovel is composed of wire, which allows the ashes to escape through the sides as well as the bottom.

Claim.—The shovel described, having the handle B, frame A with flattened part *a* and screen *c*, formed and united as described, for the purpose set forth.

144,851.—Diamond Millstone-Dressing Machine.—DANIEL LAREE, Pottsville, Pa., assignor of one-third his right to SAMUEL E. GRESCOM, same place. Application filed October 4, 1873.

The rocker secured to the reciprocating frame engages with weighted catches pivoted to the bed-plate, and feeds the diamond transversely, either to the right or left, according to the position of the double pawl. The feed is adjusted by a set-screw, which limits the throw of the rocker, and turns the ratchet either slow or fast, as desired.

Claim.—The combination of the bed-plate A, longitudinally-sliding frame B, transversely-sliding diamond-carrier D, feed-screw J, ratchet L, rocker M, pawl N, latches V W, and set-screw T.

144,852.—Combined Quarter-Connection and Parallel Motion for Engines.—ARTHUR J. L. LORENZ, Brooklyn, N. Y., assignor of one-third his right to NORMAN HUBBARD, same place. Application filed October 1, 1872.

A double vertical cylinder-beam engine is connected by side rods and links to vibrating cranks on each side of the cylinders, and from these cranks to the main crank in the center by connecting-rods. Two beams are journaled in the central frame, one end connected to the piston-rods and the other to the pumps. The object is to obtain four vibrating points, or a continuous motion from the beams, as would be required for four pumps.

Claim.—1. The arrangement of the cylinders A and B with their beams C and D, the side connections M, rock-shaft K with its cranks L and J working in bearings in the same bed-plates G to which the cylinders A and B are bolted, and connected on the quarter, through rods R^1 R^2, to main crank I of the crank-shaft H placed in the center between the cylinders A and B, substantially as and for the purpose hereinbefore set forth.

2. The combination of the cross-head O, piston-rod P, connecting-rods N, beams C or D, and crank L, substantially as and for the purposes described.

144,853.—Harness-Pad.—STEPHEN A. MARKER, Indianapolis, Ind. Application filed October 2, 1873.

Claim.—1. The herein-described device for fastening the skirt to harness-saddles or coach-pads, consisting of a plate having the opening B, tongue A, and flanged ends C C′, in combination with a brace, D, securely attached to the under side of the skirt, and having raised shoulders *f f′* and flanges *g g′*, which engage with the flanges C C′ and tongue A, substantially as and for the purpose set forth.

2. A pad-plate for harness-saddles or coach-pads, constructed with the tongue A and flanged ends C C′, with or without the opening B, the said opening being cut in the plate to make room for the skirt, and secure it more effectually to the pad, substantially as and for the purpose set forth.

3. In a harness or coach-pad plate, the opening B for accommodating the skirt, and fastening it more securely and directly to the pad, as set forth and described.

4. The brace D, consisting of a raised middle, *d*, the shoulders *f f′*, and flanges *g g′*, when constructed, arranged, and operating substantially as and for the purpose set forth.

144,854.—Railroad-Signal.—EDWIN R. MARSHALL, Grand Rapids, Mich. Application filed November 13, 1872.

An air-pump beside the track is operated by a passing train, and is connected by tubing to a vertical cylinder, in which works a piston connected by a rod, and cords passing over pulleys with lanterns to be shown or hid by raising or lowering. A branch of the cylinder has also a piston, the rod of which strikes a gong in rising, or it may be arranged to blow a whistle.

Claim.—1. The semaphore C, having a hollow main trunk and side boxes, C′ C′, in combination with the interior air-cylinder D, having blast-tube F and piston *a*, the rod *b*, cords *c c*, guide-pulleys C^2, and signals E, as described.

2. The cylinder D, provided with the side cylinder D′, having exhaust-opening *h* and piston-rod, adapted to strike the gong *n*, as described, for the purpose set forth.

144,855.—Hat-Conformator.—JOHN J. MCKNIGHT, Tarrytown, N. Y., assignor to himself and ABRAM STORMS, same place. Application filed August 21, 1873.

An oval band has grooves which radiate from the center in which the feeler-slides are adjustable to the contour of the head. They are held in position by friction-springs interposed between them. The conform or band-block is also oval-shaped, and provided with similar grooves and slides. Its radial slides are kept distended by an endless spiral spring which passes through them, thus enabling the slides to adjust themselves to the exact contour or caliber of the conformator. The slides are held in position by an oval-shaped clamp, receiving pressure from pivoted posts, actuated by cords passing around them diagonally from one to the other, and which are connected to nuts operated by a right and left-hand screw. As the pressure is released the clamp is thrown up by springs beneath it.

Claim.—1. The conformator A, composed of the recessed supporting-band *z*, the radial feeler-slides *y*, and the frictional spring-stops *x*, the latter being so combined with the feeler-slides as to press laterally against the same, in the manner and for the purpose specified.

2. The pivoted guides S and curved conform-slides *v*, constructed and operating, in combination with each other, substantially as herein described, for the purposes set forth.

3. The endless expanding spring *u*, in combination with conform-slides *v*, perforated to receive the same, as described, for the purposes specified.

4. The single tightening-screw *r*, traversing-nuts *p*, grooved rollers *o*, and flexible connections *n*, in combination with the presser-levers *s*, for tightening the retaining-band *t*, and thereby fastening the conform-slides, as set forth.

144,856.—Oil-Cabinet.—THOMAS MILLER, East Boston, Mass. Application filed March 3, 1873.

Claim.—As an improved article of manufacture, the improved oil cabinet, as described, the same consisting of the two parts A and B, as shown, the base or lower part being composed of metal, and the part B of wood, having a metal sink, D, of a like area of the part A, and provided with lid C, as described.

144,857.—Gas-Retort Mouth-Piece.—PETER MUNZINGER, Philadelphia, Pa. Application filed October 3, 1873.

The lead base is inclosed within a counter-sink on the face of the retort. The water-chamber is formed in the enlargement around the mouth-piece sufficiently near to the soft-metal base to carry off heat and prevent melting of the metal.

Claim.—The retort mouth-piece B, having a soft-metal lid-base, *a*, in connection with a water-jacket, F, as and for the purpose shown and described.

144,858.—Carbureter.—JAMES MUSGRAVE, Cincinnati, Ohio. Application filed October 2, 1873.

The air first comes in contact with the gasoline in the mixing-chamber, and, escaping thence, rises through the perforated flange, becoming saturated with vapors. The perforated drum surrounding the exit pipe regulates and steadies the flow of gas.

Claim.—1. A mixing-chamber, D, and float F, in combination with a perforated flange, H, substantially as and for the purpose specified.

2. In combination with the mixing-chamber D, float F, and perforated disk H, pipes constructed with flexible screw-joints, for the purpose of admitting air to the chamber D when the same is at different elevations, and so arranged as to balance each other, so that the float, as it rises and falls, may constantly maintain a horizontal position, even with the surface of the liquid, substantially as herein specified.

3. In combination with the exit-pipe *i*, the perforated drum *m*, or its equivalent, for the purpose specified.

144,859.—Stem Winding and Setting Watch.—EUGÈNE J. PACAUD, Schaffhausen, Switzerland, assignor to FLORENTINE A. JONES, same place.—Case B. Application filed June 30, 1873.

The spring-arm which moves the sliding clutch of a stem winder and setter is operated by a swinging dog, which has two arms, one terminating against the snap-spring, the other projecting through the bezel in position to be moved by hand.

Claim.—The spring-lever *d*, provided with the concave depressions d^1 d^2, forming the shoulder d^3, in combination with the ratchet *f* and the bifurcated angle-lever *e*, having the beveled point *e′*, all arranged and operating substantially as described.

144,860.—Fly-Trap.—CYRUS PACKARD, Eureka, Nev., and STRANUS STANDISH, Pacheco, Cal. Application filed September 9, 1873.

The lower case contains the machinery that operates a reciprocating drawer that connects with the double passage-way leading to the wire cage which is attached to the back part of the lower case. The reciprocating drawer is moved by a rack that engages with a pinion on a shaft bearing a large wheel that engages with two pinions on side shafts which bear at their opposite ends larger cogged wheels, with one of which the operating-shaft is connected. A weighted lever is connected with the central large wheel, and produces the reciprocating motion of the drawer.

Claim.—1. The passage-way B and the partition *c*, in combination with the reciprocating drawer C and the wire cage F, substantially as and for the purpose specified.

2. The spur-wheels *m m* and the shafts *l l*, the pinions *n n*, intermediate wheel *o*, pinion P, rack A, weighted lever S, and pin *u*, in combination with the case E and the reciprocating drawer C, the whole arranged to operate substantially as and for the purpose specified.

144,861.—Register for Machinery.—SHELDEN F. PAYNE, Chicopee, Mass., assignor to GAYLORD MANUFACTURING COMPANY, same place. Application filed July 22, 1873.

A nut traversing a screw-shaft carries a pointer along a scale, and on reaching the end strikes an alarm. The nut can be adjusted to start from any desired point. The apparatus is attached to any mechanism the movements of which are to be registered.

Claim.—1. In combination with shaft H with its crank-arm B, the sliding reciprocating bar F, for the purpose of diverting the rotation of the shaft A in either direction through pawl and ratchet C D to screw E, substantially as shown and described.

2. In combination with feed-screw E and with rods H H, the feed-nut W having the sides *h h*, sections *o o*, supports *d d*, and operating-lever G, substantially as shown and described.

3. In combination with the feed-nut W, the pointer *m* and spur *n*, as shown and described.

4. In combination with the feed-nut W having a suitable spur or projection, *n*, the hinged lever *q*, and alarm-bell I, when constructed and arranged substantially in the manner and for the purpose as set forth.

5. In combination with the feed-nut W and with the pawl C, the pin K with its spring *y*, substantially as shown and described.

6. In combination with the pin K, the lever X with suitable handle R, substantially as shown and described.

144,862.—Hose-Coupling Spanner.—LEWIS POND, Foxborough, Mass. Application filed October 31, 1873.

The ends of the levers are bent to form hooks for the fingers, and also bent outward so that when the arms are closed a space or opening between them will be left for the insertion of the third finger to open the spanner preparatory to closing it upon the coupling.

Claim.—The hose-coupling spanner, constructed substantially as described and shown, viz., of two crossed levers, A B, pivoted together, and provided not only with hooks *c c* and eyes *e e*, disposed as explained, but with the finger-opening *f* between the longer arms, all as set forth.

144,863.—Apparatus for Carbureting Gas.—ALONZO W. PORTER, New York, N. Y. Application filed November 11, 1873.

The flame from the gas-jet plays across the wick at right an-

gles. Any surplus oil carried up by the wick falls into the well of the screw cap, and is returned to the reservoir through the trap-tube, the trap-tube also preventing the escape of any vapor formed in the reservoir when light hydrocarbons are used.

Claim.—1. The combination of the socket attachment and lock with the hinged or pivoted yoke for securing the receptacle to its place, substantially as and for the purpose set forth.

2. The well K in the lower part of the screw-cap, in combination with the trap-tube, substantially as and for the purpose set forth.

3. The flange around the mouth of the reservoir, in combination with the wall and trap-tube, as herein described.

4. The over-cap, adjustable over the end of the burner, for the purpose of supplying air to the flame, substantially as herein set forth.

144,864.—Sewing-Machine.—D'ARCY PORTER, Cleveland, Ohio. Application filed August 4, 1873.

The vibrating shuttle-carrying arm is provided with a bracket-like end and bar, and is pivoted to move horizontally. An eccentric on the feed-actuating shaft has its strap connected with the bar of, and vibrates, the shuttle-carrying arm.

Claim.—The shuttle-carrying lever provided with bracket D and bar F, in combination with the eccentric C and its strap, substantially as described, and for the purpose specified.

144,865.—Umbrella.—HAROLD L. POWER, London, England. Application filed May 5, 1873.

A detachable umbrella-handle which serves as a key to turn a locking-bolt in a socket in the stick by which the runner is locked.

Claim.—The combination of the removable handle a with stud a' and recess a'', socket c with groove c', and locking-bolt e, all constructed and arranged as described, for the purpose set forth.

144,866.—Head-Block for Saw-Mills.—GUSTAVUS A. PRESCOTT and JOSEPH BARSALOUX, Sandy Hill, N. Y.; said BARSALOUX assignor to said PRESCOTT. Application filed January 30, 1873.

Two pawls are attached to a lever upon opposite sides of the fulcrum, and produce a continuous movement of the sliding head to which they are attached when the lever is oscillated. By turning the lever down upon the ratchet-rack the head is locked in position.

Claim.—The combination of the rack a, head b, pawls d i, and bifurcated lever d, the lever being so constructed as to lock the head in position, substantially as set forth.

144,867.—Hog-Ringing Pinchers.—JOHN C. SCHOETTLE, Collinsville, Ill. Application filed June 9, 1873.

Claim.—1. The measuring device B, having slot b and flanges b^1 b^2, as and for the purpose set forth.

2. The combination of cutters a a', measuring device B, and pinchers A, as and for the purpose set forth.

3. The upper and lower grooves, c, and bevels C, for the purpose of bending the ends of the cut wire, as set forth.

4. The combination of pinchers A, cutters a a', measuring device B, grooves a a^1, bearing D, and bevels C, all constructed to operate as and for the purpose set forth.

144,868.—Paper Dry Gas-Meter.—AUGUST SCHÜSSLER and CHARLES F. DIETERICH, New York, N. Y. Application filed November 10, 1873.

These diaphragms for dry meters are made from parchment-paper, which is obtained by treating cotton or linen paper with equal parts of sulphuric acid and water for a few minutes, and then washing it thoroughly, saturating this product with equal parts of glycerine, acetate of potasse, and water.

Claim.—The application of paper, when treated substantially in the manner aforesaid, for dry meters, substantially for the purpose set forth.

144,869.—Ironing-Table.—LEVI SCOFIELD, Grand Haven, Mich., assignor to JUSTIN B. WAIT, same place. Application filed October 20, 1873.

The ironing-board has a frame hinged to the under side of the large end. To this are pivoted supports for each end of the table, with means of adjustment.

Claim.—1. The hinged ironing board or table A, provided with cleats I H on its under surface, in combination with the frame B, and hinged support G provided with the swinging brace J, the whole constructed, arranged, and operated in the manner and for the purpose set forth.

2. The supporting-frame B hinged to the table-top, in combination with the articulated bars E E and F F, the latter being provided with recesses in their upper ends, which engage with the rod D, substantially as described, and for the purpose set forth.

144,870.—Breech-Loading Fire-Arm.—WALTER SCOTT, Birmingham and WILLIAM JAMES MATTHEWS, Aston, England. Application filed May 14, 1873.

A laterally-sliding breech-block, operated by means of a lever or handle, carries an adjustable stud so arranged as to operate the extractor when the breech is opened. The adjustability of the stud admits of the breech-block being entirely removed when desired.

Claim.—1. The adjustable stud f, projecting from the face of the breech-block, and arranged to operate, in combination with the extractor A, to throw out the cartridge case or shell when the block a is drawn out to open the breech, as herein set forth.

2. In a breech-loading fire-arm, the block a, lever f, and extractor A, constructed as shown and described, and operating, in combination with the end of the barrel and the breech-shoe c, as herein set forth, and for the purposes specified.

144,871.—Sap-Spout.—HIRAM B. SEVEY, Vienna, Me. Application filed November 1, 1873.

A sap-spout constructed with a thread running its entire length for securing it into trees. On the outer end is formed a rim for holding a bucket; also slots into which a suitable instrument may be inserted to force it into the tree. Its rear end is provided with slots into which the sap flows.

Claim.—The device for the delivery of sap from trees herein described, consisting of the screw a, provided with the threads b, tapering hole c, longitudinal slots d, projecting edge or rim e, and notches f, as and for the purposes herein set forth.

144,872.—Breech-Loading Fire-Arm.—HENRY N. SHERMAN, Beloit, Wis. Application filed June 26, 1873.

Claim.—The spring E, whose free end acts as a catch-head, in combination with the stock A, notched lug b b' of the barrels B, and the trigger c, substantially as and for the purposes set forth and shown.

144,873.—Whiffletree.—DANIEL S. SLOAN, Rockville, Conn., assignor to J. H. LEWIS, L. S. LEWIS, and A. D. WEST, same place. Application filed March 8, 1873.

Claim.—The double whiffletree-bar a, provided with the straps m m', the chains n n' o o', and the clevis f, the whole constructed, combined, and arranged for operation and use substantially as described.

144,874.—Thrashing-Machine.—JOHN SMITH, Burlington, Wis. Application filed July 29, 1872.

Long stationary sieve extending under cylinder, and having transverse perforations, between which are projecting rake-teeth, between which take teeth carried by endless belt.

Claim.—The stationary sieve Q, constructed as described, and arranged beneath the conveyer P, in combination with the toothed wheel D and thrashing-cylinder C, all constructed, arranged, and operated as described.

144,875.—Lubricating Compound.—NATHAN D. SMITH, Prairie City, Iowa. Application filed October 13, 1873.

Claim.—The lubricating compound composed of turpentine, tallow, and plumbago, substantially as described, and for the purposes specified.

144,876.—Umbrella.—CHARLES B. SPENCER, Hastings, Minn., assignor of one-half his right to MARCUS MARX, same place. Application filed April 29, 1873.

The runner and crown-piece are conical, and consist each of four separate sections. A screw-ring works up on the outside of them. As the ring is screwed to the small or taper end the sections are pressed tightly around the stick, thereby securing the runner and crown-piece, and vice versa.

Claim.—The combination of adjustable fastening-sections A, screw-ring B, springs f, thumb-piece g, sliding arms H and I, folding arms k, and block N, substantially as and for the purpose herein set forth.

144,877.—Manufacture of Fertilizers.—HANNELL STEVENS, Brazoria, Tex. Application filed May 27, 1873.

Claim.—The improved process of converting animal matter into a fertilizer after the rendition of fatty matter therefrom by the evaporation of the remaining liquid into a sirup, and then mixing such sirup with the solid animal matter and plaster-of-paris, substantially as described.

144,878.—Device for Connecting Frames of Valises, &c.—CARL VOTTI, Newark, N. J. Application filed September 19, 1873.

Points are struck up from the metal frame and project inward. They are passed through the material composing the bag and turned down upon it. An auxiliary frame is afterward secured on the inside, which covers the points and conceals the edge of the material.

Claim.—The combination of frame a, nibs c, and plate or interior frame d, when arranged and constructed substantially in manner and for the purpose described and set forth.

144,879.—Seeding-Machine.—EDWARD WITZIGMAN, Buffalo, N. Y. Application filed August 27, 1873.

A pair of wheels supports an axle-tree and frame upon which is mounted a seed-box, the distributing device being worked by gears attached to one of the wheels. Beneath the axle-tree and frame is suspended a harrow by four chains, radiating downward from a common center, a windlass being mounted above the frame to raise the harrow from the ground at will. The draft is supported by a chain reaching forward to the tongue.

Claim.—In a sulky seed-sower, the seed-box F, when constructed with the valve or door G, spring f, catch g, lug A, and set-screw d, in combination with the shaft H, cams or pins j j, and step e, all arranged to operate in the manner and for the purpose substantially as specified.

144,880.—Means for Operating Railway-Switches.—JOSEPH WOOD, Red Bank, N. J. Application filed November 4, 1872.

Claim.—In a switch-stand, the combination of the vertical shaft A, having right-angled arm a and bolt e, with the top plate having notches y, and the lever m having jointed and fulcrumed handle n, adapted to fall vertically into the notches y, and thus secure the shaft from accidental shifting, and also to form a means for elevating and turning the shaft, substantially as specified.

144,881.—Testing-Plug.—JOHN ALLEN, Philadelphia, Pa. Application filed November 1, 1873.
